Fifteen prizes were hung out in both the senior and junior classes, ranging from $50 for the first prize to $10 for fifteenth place. In addition to this, the American Short-horn Breeders' Association and the American Hereford Breeders' Association added 25 per cent to all premiums won by Short-horn and Herefords at this show. The winners in the order of their placings in the senior class, were: 1st, Walter Hartman, of Lodi, Angus steer; 2d, Josephine Herr, Lodi, Short-horn steer; 3d, Alvin Morley, Baraboo, Short-horn steer; 4th, Ted Scott, Bagley, Hereford steer; 5th, Charles Skaife, Livingston, Short-horn steer; 6th, Will Radl, Lodi, Short-horn Steer; 7th, Lee Jewell, Mineral Point, Hereford heifer; 8th, Elwin Thompson, Lake Geneva, Hereford heifer; 9th, Charles Skaife, Short-horn heifer; 10th, Harry McCann, Janesville, Short-horn steer; 11th, Harold Lintner, Arlington, Short-horn steer; 12th, George Premo, Baraboo, Angus steer; 13th, Howard Roser, Baraboo, Angus steer; 14th, Florence Scott, Bagley, Hereford heifer; 15th, Wendell Kelley, Mineral Point, Angus heifer. Others showing in the senior classes who did not place in the money were Leslie Doe, Beldenville; Genevieve Kelley, Mineral Point; Henry Kurtz, Dane; John McCann, Janesville; Stanley Premo, Baraboo; Frances Martin, Bagley; Wayne Martin, Gotham; Kitchell Sayre, Edgerton; Ralph Seyforth, Mondovi; Clyde Taylor, River Falls; Roland Webb, Poynette; L. L. Foster, Elkhorn.

In the junior class fifteen entries gave everyone an opportunity to get in on the premium money. This class was on the whole more uniformly well fed and in higher condition than the senior class. Though the grand championship was won by the senior calf, the average of the junior class was better throughout than the average animal in the senior class. The champion of the juniors was a Hereford steer owned and fed by Ted Scott, of Bagley. In second place stood a large Short-horn steer fed by Will Radl, of Lodi. The master was hardly tall enough to reach the shoulder of his

Grand Champion Baby Beef Steer.

Fred Hartman, Lodi, Wis., and his prize-winning Angus steer. On the left in the picture is J. G. Imboden, Decatur, Ill., judge, and in the center W. L. Houser, Mondovi, Wis., who has done much to promote the baby beef contest.

(Concluded on page 7.)

CURRENT EVENTS

MORE American lives were lost in the fighting in northern France last week, but the particulars are meager. A German shell is said to have exploded in an American trench, spilling American blood. At the same time, the American soldiers secured at least partial payment for their loss of a week or so before. A dispatch from northern France had this to say of the encounter which an American patrol had with the enemy: "The American patrol, in which were some Frenchmen, arranged the ambuscade near the German lines on a shell ruined farm. After lying in the mud nearly all night the patience of the watchers was rewarded by the sight of a large German patrol, its number more than double that of the Franco-Americans. The Germans were permitted to pass, when the Americans and Frenchmen on their flank opened a hot fire from shell craters and other shelters where they were secreted. The Germans were taken completely by surprise and bolted, carrying with them their men who had been hit. The number of dead and wounded Germans is uncertain, but none of the men in ambush was hit by the bullets the Germans later sent in from a distance." America may expect a heavy casualty list before the war is over, for the enemy is determined to fight it out to the bitter end and is particularly enraged toward America, which it had never expected to enter the fray. There will be weekly loss of lives to report, undoubtedly growing in volume as the winter progresses.

AT last reports, the Austro-German army continued to win over the retreating Italians, who seem to be in a bad way. The Italians are said to be making a stand at the Piave river, with the historic and picturesque city of Venice but little over twenty-five miles away. The Teutons were pressing hard and while the Italians were making a gallant stand, they were being pushed back in a number of places. By this time the English and French reinforcements have undoubtedly reached the Italian line, so that a better showing may be made, but it cannot be denied that Germany has heartened Austria anew and has made a most determined assault against the enemy in a vulnerable spot. While this is the situation in Italy, matters are in a bad way in Russia, where a counter revolution has been in progress against Kerensky for some days past. There are many conflicting rumors, but it appears that the Kerensky government does not have the firm hold upon affairs that it had a month ago. It is to be expected that there will be numerous outbursts and revolutions, for freedom is a new gift to the Russian people and they will abuse it, as well as use it, until they become accustomed to the novelty. One thing seems certain and that is that Russia will be little or no help to the allies in their fight against Germany for some time to come.

THE United States is about to add several hundred thousand tons of shipping to the stream of ships carrying American troops and supplies to aid the allies. Negotiations with the northern European neutral nations and with Japan for tonnage have reached a final stage and the vessels obtained either will go directly into trans-Atlantic routes or will release American ships for this service. The European neutrals finally have agreed to turn over to the United States and the allies ships in exchange for foodstuffs that only America can supply. The quantities of food to be furnished will be determined later, but the neutrals have the assurance of the American government that they will be given enough to meet their necessary requirements. Japan will sell outright to the United States a large amount of tonnage now in the Pacific in exchange for steel shipments the Japanese are anxious to obtain to complete their merchant shipbuilding program. Negotiations with the Swedish mission were wound up several days ago. The amount of tonnage the United States is obtaining has not been made known, but there are in American ports now more than 400,000 tons of neutral ships, which will be put into some American service. Many of the ships will ply between American ports and South America, each releasing an American or British vessel for service through the war zone.

ONLY one British merchant vessel of more than 1,600 tons was sunk by mine or submarine last week, according to the weekly statement of shipping losses. This is the low record since Germany began her submarine campaign. Five vessels of less than 1,600 tons and one fishing boat were sunk during the week. Not since Germany began her intensified submarine campaign in February has the total number of British merchantmen sunk by mine or submarine been as small as the above admiralty statement shows. The previous low record was twelve merchantmen, eight of them of a tonnage in excess of 1,600, and four of less than 1,600 tons. The high crest of the wave of British merchantmen sunk was during the week of April 22d, when forty ships of 1,600 tons and over and fifteen less tonnage were sunk. The next high record was the following week when thirty-eight vessels of the larger and thirteen of the smaller category were sent to the bottom.

CONFIRMATION has been given by the German government itself to the often denied reports current for the past year that young girls of Alsace-Lorraine have been carried away from their homes and forced to labor for the German army. From Switzerland there came a cable report of the reply made by the German undersecretary for war to a complaint of an Alsatian deputy in the reichstag against mistreatment of these young girls. The government's reply took the form of an official communique, which in substance stated that the army administration had taken measures to assure the girls requisitioned in Alsace-Lorraine and actively employed in work at the front of the benefits of moral and religious supervision. Only 8½ per cent of the girls are less than seventeen years of age, the deputy was assured, and scarcely one-half of them have been subjected by force to work at the front.

CONFIDENCE that the American farmers can meet the burden of feeding this country and the allies was expressed by Secretary of Agriculture Houston in an address before the annual convention of the association of American Agricultural Colleges and experiment stations. Production, the secretary said, must be maintained, if not increased. The labor problem, Mr. Houston declared, is not an easy one, and to its solution the departments of agriculture and labor and state agencies are bending their best efforts. He outlined plans now being worked out for mobilizing labor for the farms from both the rural and urban districts and said that with alert and coöperative action by the farmers the situation could be met.

THE second national army, of approximately a million men, will be drawn according to classification by industry, number of dependents and so on, rather than by number, as was the first army. In order that the selective principle may be carried out to the fullest extent President Wilson has directed that all registrants be divided into five general classes. Classification will be started on or about December 15th and the new army will probably be drawn about the middle of February. The president asks that the old local boards be retained. These boards will receive the official questionnaires in the near future. They will then mail them to the registrants at the rate of 5 per cent a day; this will require twenty days. The division of registered men will give each man a place in the military, industrial or agricultural ranks; the call to the colors will be based on this official ranking. District court judges are designated to preside over a committee of lawyers in each community, who will give free and impartial advice to all men subject to the draft. These committees will have offices near those of the local exemption boards. Men called in the first contingent are not affected in any way by the new rules. Single men, without dependents, will be called first, leaving the married men to be selected later, those without children or dependents to be taken before those who have. Farm labor is not exempted, but it is put down on the list, so that it will not be reached in the first stages of the forthcoming draft.

IN declining the position of head of the new air ministry in the English cabinet headed by Lloyd George, Lord Northcliffe (the noted English editor who has been the head of the English war mission in the United States for several months past) pays a great tribute to the thoroughness with which the United States is carrying on its war preparations. Among other things he said: "Returning after five months spent in the virile atmosphere of the United States and Canada, I find that while these two countries are proceeding with their war preparations with a fervor and enthusiasm little understood on this side of the Atlantic; while the United States instantly put into operation conscription over which we wobbled for two years and is making short work of sedition mongers; while Canada has already given such proofs of thoroughness as the disfranchisement of conscientious objectors and the denaturalization of all enemy aliens naturalized within the last fifteen years; while we, for our part, are asking immense sacrifices from these peoples, there still are in office here those who dally with such urgent questions as that of unity of war control, eradication of sedition, mobilization of the whole man and woman power of the country and the introduction of compulsory food rations. May I also take this opportunity of giving warning about our relations with that great people from whom I come? We have had the tragedy of Russia, due to lack of allied propaganda to counteract that of the Germans. We have had the tragedy of Italy, largely due to that same enemy propaganda. We have had the tragedies of Serbia, Rumania and Montenegro. There is one tragedy which I am sure we shall not have and that is the tragedy of the United States. But from countless conversations with leading Americans I know that unless there is swift improvement in our methods here, the United States will rightly take into its own hands the entire management of a great part of the war. It will not sacrifice its blood and treasure to the incompetent handling of the affairs of Europe."

"To Those Looking for a Home"

Where they can establish themselves and in a few years have enough of this world's goods to take care of them in their declining years —

Grand Valley, S. D.

Dear Sir:—In reply to your inquiry, beg to say that I came to the Standing Rock Reservation in the year of 1910. While I am among the newer comers to this country, I cannot speak too highly of the possibilities of its future. My former home was in Boone County, Iowa, where land has attained a value that puts it out of the reach of a man of limited means. To those who are looking for a home where they can establish themselves, and in a few years have enough of this world's goods to take care of them in their declining years, I would say, Come to South Dakota.

This is truly an alfalfa country. All of my neighbors are raising this valuable forage plant to a greater or lesser degree, and without one exception, it is doing well.

Dairying can be successfully carried on in this part of the country. The grasses are as nutritious as can be found any place, and with the successful growing of alfalfa there is no reason why this will not be a great dairying district in time.

Garden truck of all kinds does fine. We have good water and cheap fuel, good neighbors and good schools and churches.

Yours truly,
(Signed) SAMUEL ELLSWORTH.

Come to
South Dakota

This is the opinion of Samuel Ellsworth, an Iowa man who, as his letter tells, moved from Iowa to Grand Valley, South Dakota.

Six years' experience, taken together, have convinced him that South Dakota is the country for him.

His letter, reproduced in full, is one of hundreds received and published in our *North* and *South Dakota book*, *sent free* to those interested.

South Dakota is a diversified stock and farming country that, as another letter puts it, is "hard to beat."

Garden truck also does exceptionally well—climate is ideal—short, mild winters allow stock to winter on the range.

While irrigation is not usual in South Dakota, in certain sections it has accomplished wonderful results. One farmer raised $750 worth of tomatoes on five-eights of an acre—twenty acres of potatoes brought $2,535—two acres of melons $486—five acres of sweet corn $450—cabbage averaged $400 an acre—cow beets for dairy feed ran 42 tons to the acre and sold for $10 a ton. In all, the 55 acre tract brought a gross return of $5,010.30. The complete story is told in the North and South Dakota book.

Short-Horn Stockholders' Meeting.

Session to Be Held During International.

The annual meeting of the stockholders of the American Short-horn Breeders' Association will occur Wednesday, December 5th, at the Congress Hotel, Chicago, at 7 p. m. Plans have been completed for the members to dine together, after which will follow a number of addresses, the election of officers and the usual business program. This arrangement cannot fail to contribute materially to the enjoyment of the occasion and to the prevailing good fellowship which is one of the distinct features in Short-horn unity and progress.

Never in the history of the Short-horn breed has such advancement been made as that achieved during the past six years. Never has the trade been as firm, the demand as widely distributed or the prices as consistent.

The annual receipts from registrations at the association's office have grown from $25,000 but a few years ago to approximately $175,000 for the current year. These rapidly growing receipts are being utilized for giving service to and promoting the interests of all who are identified with the breed.

In view of the enviable condition of Short-horn trade and affairs and the flattering prospects, the forthcoming meeting and dinner should prove a felicitious occasion.

Stockyard figures gathered by the food administration show that 73.3 per cent of the calves slaughtered at nine large packing points in this country during the first nine months of this year were males.

Without more meat and fat from America than the allies have received in the past three years they cannot remain in fighting trim.

ARE YOU A TENANT FARMER? Be an owner, not a renter! You can OWN a productive farm in a region of generous rainfall, mild winters, long growing season and healthful climate—and can buy it at very low prices and on surprisingly easy terms. Your opportunity is in the

HIGHLANDS OF LOUISIANA

Other Northern men now there, formerly owners as well as tenant farmers, are prospering on their own land, growing a great variety of staple crops. Investigate for yourself. Send for the big, FREE book of facts

"Where Soil and Climate Are Never Idle"

Then visit these lands. Low rate excursions from nearly all Northern points first and third Tuesdays of each month. ACT NOW!

THURSDAY, NOVEMBER 22, 1917.

FAMILY CIRCLE TALKS BY THE PUBLISHER

BORROWING FROM UNCLE SAM.

I AM not exaggerating when I say that I have answered hundreds of letters from subscribers, within the last few weeks, dealing with the federal farm loan law. It is quite apparent that many of my readers have either forgotten my explanations of this law, which I published about a year ago, or else they are more interested now that the law has been successfully tried out and their friends and neighbors are enjoying its privileges. Perhaps another general article on the subject might not be amiss.

To begin with, therefore, I might state that Uncle Sam has established twelve federal land banks, of which four are located here in the grain belt. The one at St. Paul loans to farmers living in Minnesota, Wisconsin, North Dakota and Michigan. The one at Omaha loans to farmers living in Nebraska, Iowa, South Dakota and Wyoming. The one at Wichita loans to farmers living in Kansas, Oklahoma, Colorado and New Mexico. The one at St. Louis loans to farmers living in Missouri, Illinois and Arkansas. It is impossible to borrow from any other than the bank for the district in which you live, so that my grain-belt readers should see into which group their state falls and apply to that bank, and not to any other.

The loans are made on farm-land security and its improvements only; personal credit and live stock collateral have absolutely nothing to do with the loan. Loans may be made for as much as 50 per cent of the appraised valuation of the land, together with 20 per cent of the appraised valuation of the permanent, insured improvements thereon. The loans bear 5 per cent interest and may run any length of time, from five to forty years. A portion of the principal is paid annually, with the interest, so that the mortgage is paid off gradually, on the installment plan. I have seen it figured that 1 per cent of the principal paid annually, with the interest, would wipe out the entire indebtedness in thirty-five years. Let us assume, therefore, that a farmer borrows $5,000. His interest, at 5 per cent, would be $250 a year. But if he pays 1 per cent more (or $300 a year, instead of $250) the loan will be paid off in thirty-five years and the mortgage will never come due at any one time.

There are certain restrictions to the law, certain red tape which must be unwound before advantage can be taken of it. In the first place, every borrower must join with at least nine other farmers to form a loan association. He must also subscribe to stock, in the association, to the extent of 5 per cent of his loan. Thus, if he borrows $5,000, he must buy stock to the amount of $250. This money will be returned to him, in full, when the mortgage is finally wiped out, so that it is in no sense a bonus or commission. Moreover, if he does not have that much ready cash before making the loan the federal land bank will simply deduct it from the amount it loans him. Thus, again, if the loan is to be for $5,000, the bank will take a mortgage for $5,000 and hand the borrower $4,750 ($5,000 less $250) and when the mortgage is all wiped out the other $250 will be returned to him, with whatever amount it has earned while the loan association has had it. Should any of the other farmer borrowers in the loan association become delinquent, and loss be sustained on this account, the other members are liable to 5 per cent of their loan. Inasmuch as the loans are made on only 50 per cent valuation and there is no better security in the world than a grain-belt farm, I do not look for this to happen very often, so it is not worth worrying over. But, should the worst happen, each farmer borrower would be liable for only 5 per cent of his own loan, or $250 in the case his own mortgage was for $5,000.

Land and improvement appraisals are made by farmers who are members of the loan association to which the borrower belongs. They know local conditions and values and usually make it easier for the borrower to obtain a large amount. Their appraisals are subject to review by the bank officials and must be approved before the loan is made. I understand, however, that their appraisals generally stand.

These, in merest outline, are the more important working details of the law. I am always glad to have my readers write to me on this or any other subject, but they would save time if they would write direct to the secretary of the federal land bank in the district in which their state is located, according to my list above. Ask for circulars giving detailed information, for application blanks and for suggestions. I have found these federal land bank officials to be courteous and obliging, and I believe my readers will, too. In the event they do not answer, or satisfactory replies cannot be had, do not hesitate to write to me. I am only too glad to serve you; my idea was that you could save time (which is valuable, if loans are desired quickly) by writing direct to the proper bank officials.

A CHOICE OF MASTERS.

ONE of the greatest difficulties that the public has suffered from, in attempting to secure its rights from the vast combinations of capital, which control the necessities of life and business, is that the latter are better paymasters and so are able to secure the services of the best brains and talents of the land, supplying them with plenty of funds, which are the sinews of war. Some of these hired servants of the corporations, after their best working days are over and they have amassed a competency, see a great light and espouse the people's cause, but they are never able to undo what they have done in their prime to oppose the principles of justice for the great mass of the people. Think of what such a giant intellect as Elihu Root might have accomplished for democracy and justice in this country had he held the views twenty-five years ago that he has expressed since he returned from his mission to Russia!

I do not know that we should blame these men greatly for taking the easier path, which leads to wealth and to social and political preferment, for they are naturally human. Perhaps it is the public—ourselves—that we should blame, because we have not made our cause equally attractive. At all events, what I had in mind to say here was that when we do find some outstanding genius, who puts aside the crown of corporation employment to serve the interests of the common people in their eternal struggle for justice, it warms the blood and renews one's faith in human nature.

I am reminded of this by the case of Hon. Clifford Thorne, of Iowa, who has perhaps done more for the shippers of this country in their efforts to secure fair rates and decent treatment from the railroads than any other man. I have the pleasure of knowing Mr. Thorne well and I regard him as the best informed man on transportation conditions and statistics of any in the entire country. He might just as well be drawing an immense salary from the railroad interests, whose plans and schemes for soaking the public he has upset time and again, but instead he has preferred to serve the public, first at a meager salary, as chairman of the Iowa State Railroad Commission, and now as counsel for the shippers before the Interstate Commerce Commission in the 15 per cent freight rate advance case being heard this week in Washington.

No one is so cordially hated by the railway interests of this country as Mr. Thorne. He has been assailed by them in every possible way, in the press and in such magazines as the Railway Age Gazette, but I have noticed that his critics always deal in glittering generalities, instead of getting down to concrete facts. It is just as well for them that they do so, for whenever they have attempted to deal with definite facts they have found themselves badly worsted in an unequal argument with him. Gradually they have learned that Mr. Thorne is a Tartar whom they had better not try to catch, and more than one railroad official, who has joined issues with him, has come off considerably like the boy who monkeys with the buzz saw.

Only a few days ago, on the eve of the hearing on the railroads' claim for a 15 per cent advance in freight rates, John Skelton Williams, comptroller of the treasury, gave out a statement advocating the granting of the increase. The extreme impropriety of the head of one department of the government attempting to outline to a judicial body its duty in a case before it, did not deter him from rushing in where angels would have feared to tread—a fact for which I suspect Mr. Williams is now very sorry.

His statement that the railroads were suffering from a decline of credit and of earnings brought an immediate reply from Mr. Thorne, who showed that railroad stocks have not declined from impairment of credit, but from a cause common to all stocks and bonds, excepting those concerned with war supplies, and that instead of decreased earnings the railroads were earning more today than ever before in their history, with one possible exception. He also called attention to something Mr. Williams had conveniently overlooked, namely, the fact that the railroads had been allowed to amass a thousand million dollars of surplus for such emergencies. Under these conditions he suggested the inadvisability of a government official urging upon other government officials the necessity of adding a burden on the shippers of the country amounting to an annual tax of 5 per cent on a billion dollars.

Mr. Thorne invited Mr. Williams to be present at the hearings on the case and to take the stand or to cross-examine the witnesses. Mr. Williams, however, had learned that discretion was the better part of valor in dealing with Mr. Thorne on railroad matters, and discreetly found that his duties demanded his presence at his office in the treasury department, where he belongs.

During this coming week Mr. Thorne will represent the coal-consuming public at an open hearing on the fuel situation in Iowa—the first open hearing at which the consumers will be represented, with the right to cross-examine the coal operators, held in the country, in spite of Mr. Thorne's efforts to secure such an unprejudiced investigation by the Federal Trade Commission.

It is the example of such young men as Mr. Thorne, who are giving of their brilliant talents to the public instead of to more appreciative and generous private interests, that leads me to believe that there is a new and finer spirit developing in this country and that the time is coming when such public service will be regarded as being just as much a patriotic duty as heroism on the battlefield.

CHARITY WELL WORTH WHILE.

WITH the aid of my big-hearted readers, I believe I am going to be able to accomplish some good in the way of relieving destitution in farm homes where the head of the family or the son has been called away to the colors, leaving the women folks to struggle along as best they can. I have already printed the letter from the charitably-inclined farm woman offering to send wornout children's clothing to whomsoever might need it and the letter from the farm woman who was in need of just such relief. One mail this week brought me two more letters, along the same lines. The first was offering to give, as follows:

Dear Mr. Pierce:—Please send me the address of someone to whom I can send outgrown common clothing, as my children have all grown up and I have some such clothing to give away. Please refer me to the best place to send them.

The other letter was asking for relief, as follows:

Dear Mr. Pierce:—I was reading in your paper about the woman that wanted to know of any charity that would be glad to get some outgrown clothing. I have four children (twin girls fourteen years old, one boy twelve years old and a little baby girl three years old) and I have to work very hard to support them, even have to do washing and ironing for others to keep them in school. Any time that you or anybody else could send me a box of clothes I would be very glad to get it.

I am not printing the name of either writer, because charity does not consist in boasting of our generosity or revealing our needs publicly. The name and address of anyone who offers clothing or who needs it will be given by me in a private letter to any interested party. Suffice it to say that I have already written to both women whose letters I have printed above, giving each the name and address of the other, in the hope that this apparently worthy case may be relieved without undue delay.

While I am on this subject, I want to print a splendid letter just received from Eva Lehman, of Woodland, Wis., as follows:

Dear Mr. Pierce:—I have read your article in the November 1st issue on "Charity in the Farm Home." There are many things on the farm, if people only knew where to put them, that would do many town people good, not alone the very poor, but those in moderate circumstances. The farmer is called wasteful, but he is not to blame. Often he does not know where to put it, nor can he sell it.

In the summer I heard a working woman say, "We cannot buy things, they are so high in the stores, and to go to the market for what we need costs us so much in time and carfare that the expense is as great as to buy in the grocery." I replied, "Will you pay express on a box if I will send it to you?" She replied that she would. There went into that box everything from the garden, wild grapes, apples, carrots, squashes, green tomatoes, potatoes, cabbage, everything packed in boxes or bags so they could not mix and jam. On the top was a bunch of bittersweet. I wish you could have seen

(Concluded on page 8.)

Feeding Problems in Iowa County.

The Wisconsin Farmer has been hearing about some good meetings down in Iowa county, under the direction of John L. Tormey. At our request Mr. Tormey has written out for the benefit of our readers, some of the things he has been telling at cow-testing association meetings and other gatherings. Mr. Tormey writes as follows:

The meeting of the Dodgeville Cow-Testing Association held at the court house in Dodgeville, Saturday afternoon, October 13th, was not largely attended on account of bad weather and the exceedingly busy time of the year. However, about forty men were present and all of them seemed enthusiastic about learning more about feeding their live stock and growing more of their feeds on the farm. I spoke for a little while on some of the things to think about in feeding dairy cows at this time, emphasizing especially the necessity of safeguarding against drouth in the summertime. Mr. George Springer, the cow tester for the Dodgeville Association, had given me several of the things he had observed during the past summer. He noticed that the men who had silage to feed in the summer were more successful in maintaining the milk supply than those who relied entirely upon pasture. He also noticed that those who had alfalfa and clover hay to feed with silage during the dry weather were more successful than those who fed silage alone or pasture. Dry pasture grass is low in protein. Green pasture grass is rich in protein. This accounts for the falling off in milk on dry pasture and silage. I believe even when pastures are supplemented with silage that the silage and dry pasture ration needs to be supplemented with some feeding stuff higher in protein. My suggestions to the crowd were that a man should know pretty nearly how much feed would be necessary to carry his herd of cattle through the winter on liberal rations and he ought also to know about how much feed it would be necessary to buy before the winter is over. Buying now would be better than to buy later because feed prices will undoubtedly be higher as the winter advances. I also suggested the clubbing together of several farmers and ordering feed by the carload through the local feed dealer. This feed can generally be unloaded from the car to the advantage of both farmer and feed dealer. It is also a good idea to let the feed dealer do the ordering, because he can generally get the feed as cheaply as the club of farmers could get it themselves. Not only that, but if there is a little surplus feed left above what the group of farmers desire, the feed men can take it off their hands.

Professor Graber, of the college of agriculture, spoke on alfalfa. This subject is attracting a great deal of interest in Iowa county. High prices for hay and other feeding stuffs are beginning to cause serious thought on the part of the farmers. Mr. Graber emphasized principally the importance of lime on prairie soils in preparing the ground for growing alfalfa. The farmers were very enthusiastic. Many asked questions as to the death of their alfalfa and generally it was brought out that the death was due to sour soil. The great need of testing soils was strongly emphasized. Mr. Graber pointed out that the two great crops for the dairy farmer should be alfalfa and corn; the alfalfa for hay and the corn for silage. By the use of such a prolific crop as alfalfa it is possible to use less land for hay and more for pasture, a combination which would require less labor.

Such gospel will accomplish a great deal of good. Another informant tells us that practically all of the farmers who were present at the Dodgeville meeting have signed up for a farmers' institute to be held in Dodgeville the coming winter. Ex-Assemblyman Evans advises us that a great deal of interest has been aroused in these Iowa county meetings and that the farmers are anxious for more of them. Let the good work go on.

It is impossible to overestimate the importance of the alfalfa ensilage combination in dairy farming. Profit from milk production is realized only in those cases where the dairy herd is handled under what might be called high-pressure feeding. Mr. Tormey emphasizes an important point when he recommends the feeding of liberal rations during the winter months, because it is a well-known fact that a dairy cow, when she once falls off in her milk flow on account of irrational feeding, can never be brought up to so high a point in production again during that lactation period as if she had been kept constantly at her best. We feel sure that the work Messrs. Tormey and Graber are doing will accomplish much in the way of increasing production wherever their program of instruction is carried out by dairymen.

The Theory "Like Begets Like" in Breeding.

An interesting communication recently appeared in the Live Stock Journal relating to the important part which line breeding must play if pure-bred animals breed true to type. The matter is dealt with by W. G. C. Britten, who has previously been taken to task for his boldness in proclaiming that like begets like. In explaining his exact position in this matter Mr. Britten says:

My suggestion, after very careful study of results, is that like begets like in the vast majority of cases only when the back breeding of a particular animal is founded on line breeding—i. e., where there has been a concentration of blood in the pedigree, and this influences the animal to throw progeny like itself. But, supposing a particularly good-looking animal has been produced more or less by chance, then I contend that it is a gamble what type of progeny it will produce. He may throw back to any of his numerous ancestors or to all of them, and the result is a heterogeneous mixture.

Many breeders have the idea that if they have a certain defect in their cattle they have simply to buy and use a sire which is good in this particular respect and the fault will automatically disappear in the progeny. Whereas, unless careful choice is given to the selection of an animal which has been consistently bred from a strain that possesses the needed characteristic, the fault may be perpetuated and even increased, as the bull of their choice may have been a "fluke," and produced from animals which exhibited the very fault that they wish to eradicate.

The advice I wish to give to new breeders is not to buy any animal, however good it appears on the surface, without first carefully examining the full pedigree, and, if possible, gaining knowledge of the characteristics of its ancestors.

I can give numerous cases of splendid-looking animals, bred without any definite line or system, which have proved to be utter failures as breeders; but it is very seldom that this occurs in the cases of animals systematically bred.

With regard to the statement, "After all, who would dream of using any sire unless it was expected that his produce would inherit his good qualities or those of his ancestors, which he himself would be supposed to resemble?" I certainly agree that none would do so. But, unfortunately, a great many sires do not resemble their ancestors as they are supposed to do, neither do they produce animals like themselves, and often not even like their ancestors; and that is the whole point of my argument.

My contention is that the only way to insure that like begets like is to line breed, and thus concentrate such a large proportion of one strain of blood in the pedigree that a sire is almost bound to throw progeny of a similar type to his ancestors, and, therefore, like himself.

I may state that when in the United States I particularly studied their breeders' system of breeding, and in every case where line-breeding has been adopted the very best results were noticeable.

There is a growing demand from that country for our best females, which are needed to provide the necessary out-crosses under their system, and I venture to predict that the demand from that country will always be mainly for females unless our breeders adopt a similar system of breeding and produce a larger percentage of bulls that will keep alive the old adage "Like begets like."

Beginners will do well to ponder over the above paragraphs, because, as a matter of fact, a given type is much more easily and effectively fixed through the medium of line breeding than is possible where the breeding is done in an indiscriminate way. This does not necessarily mean in and in breeding, but it does signify the breeding of animals together that have similar blood lines. The expert who can predict accurately in advance the character of the progeny from a male animal does not base his prediction on the character of the individual himself alone, but takes into account his breeding. If he there finds a concentration resulting from breeding together meritorious related animals in producing this particular male, he is then reasonably safe in his predictions for the future.

Consider the Sire.

In the case of beef cattle early maturity is essential for profitable production, particularly on the farms of the corn belt where land is high in price and when the cost of feed is such an important item as it is at the present time. Pure-bred beef cattle, as everyone knows who has had experience along that line, mature earlier than scrubs. If we are to feed corn worth over a dollar a bushel to beef cattle, hay worth $20 a ton, and other feeds in proportion, we cannot afford to handle scrub cattle; they cannot be made to pay under conditions of that kind.

Never before in the history of this country has improved blood had such great value to the producer of beef as it has today. What is true of the beef sire is equally true of the dairy sire. Cows that are yielding only 150 pounds of butter fat a year, worth $60, are unprofitable. At present prices it costs every cent of that to feed a cow a year. It is the cow that yields more than 150 pounds that can begin to pay for taking care of her and yield a profit besides. We have too many mediocre cows and that is why so many farmers are getting disgusted with the dairy business and are selling out. Better sires must be used. It is wonderful what improvement a prepotent sire from high-yielding ancestors will bring about in a herd of grade or scrub cows.

An example of this is furnished by a dairy-bred bull at the Nebraska Experiment Station. Five of his daughters last year yielded 823 pounds of butter fat more than their dams. This excess production at 40 cents a pound had a cash value of $329. At that rate this bull, even when bred to only ten such cows as mentioned, would have a cash value of $5,490 because the extra income from his heifers would be equivalent to 6 per cent of the sum mentioned. It would not, of course, be advisable to buy such a high-priced bull for use on only ten cows, but when his service can be spread over a herd of 20 or 30 cows such a price would not be excessive; in fact, it would prove a profitable investment.

The point is that from now on we must make greater use of registered sires if beef and milk production is to be profitable in the future.

The Brood Sow's Care

WISCONSIN swine breeders are preparing now to put forth special effort to raise a big crop of hogs next year. The Food Administration proclaims the fact that we must raise 15 per cent more hogs than were raised in 1917 if the market demands are met. The attainment of this end depends upon the care given to brood sows during the winter months. The Wisconsin Farmer proposes a little contest, designed to stimulate interest in the subject and to aid those who have not been satisfied with their results in the past. To the writer of the best article on the topic, "Care of the Brood Sow During the Winter," The Wisconsin Farmer will pay $10 cash, and for the second best letter on the same topic a cash prize of $5 will be given. Remember that the winning of the war may depend upon the 1918 hog crop and, furthermore, hogs will be a good price. Every man who has been successful in raising good, strong litters year after year is competent to write on the above subject and this will greatly benefit fellow breeders.

More Money for Hogs.

On November 3d Joseph P. Cotton, head of the meat division of the food administration, announced a minimum price of $15.50 per hundredweight for hogs and a ratio making the value of 100 pounds of live weight of hogs equal to the value of thirteen bushels of corn. Now comes a report of the commission appointed by the United States Food Administration to investigate the cost of producing swine. This report, addressed to Mr. Hoover, is signed by John M. Evvard, chairman, Ames, Iowa; Lawrence P. Funk, Bloomington, Illinois; N. H. Gentry, Sedalia, Missouri; W. A. Williams, Marlow, Oklahoma; J. H. Skinner, Lafayette, Indiana; Tait Nutler, Memphis, Tennessee; E. W. Burdie, Herman, Nebraska.

Among other things this committee says:

We believe that definite, stimulative action is immediately necessary if the pork supply of the nation and the nation's allies is to be sufficient to meet demands.

There is a marked feeling of uncertainty evident on the part of the producer. This is manifest in the large number of unfinished hogs now going to market. There is a big tendency to market potential breeding stock—breeding stock that is essential to further increase. The feeling of unrest and uncertainty on the part of the producer is greatly accentuated by the recent marked drop in price of live hogs. First and above all, confidence should be instilled so that producers will feel that when their hogs are finished for market they will sell at a fair price—at least sufficient to cover the actual cost of production and a fair profit.

The best emergency method of stabilizing the market and preventing the premature marketing of light, unfinished pigs and breeding stock, we firmly believe, is to establish immediately a minimum emergency price for good to select butcher hogs of $16 per hundred pounds on the Chicago market. For the purpose of immediately stimulating production of swine for the next year, we recommend that a ratio be immediately established and announced at once, same to go into effect February 1, 1918. Steps should also be taken to prevent, as far as possible, any large or sudden change in process when they go from the minimum basis to the ratio basis. This minimum price should also apply to other markets and to other classes of market hogs with the usual or normal differentials.

Chicago is a basic market for corn and hogs. Therefore, we recommend that Chicago be used as the basis in any price stabilization and that adjustments of differentials, which may be found necessary in order to prevent any injustice against any section of market, be made by the food administration.

The present ratio, figured on a weighted average for late October, 1917, shows that on the basis of Chicago No. 2 corn and Chicago average hogs, that 100 pounds of average hog is selling for the low value of practically 8.8 bushels of corn; and at this time 100 pounds of average hog is selling for the current equivalent value of only 7.4 bushels of corn. It is easy to see and fully comprehend why there has been a marked decrease in production and why thousands of light, immature and unfinished hogs have been or are being rushed to market.

In the periods of heavy loss, the future production of the industry is threatened. Swine men cannot persistently stay in a losing game, even though they are intensely patriotic. They have taxes to pay and mouths to feed, and cannot be, financially speaking, good citizens in this terrible and costly war if they are engaged in a losing business.

The commission calls attention to the fact that it will require the value of 13.3 bushels of corn for 100 pounds of average hog to stimulate production and that a ratio of 14.3 bushels of corn to 100 pounds of hog must be decided on to raise production 15 per cent above normal, which is the increase necessary to meet market requirements.

Thoroughly rotted manure scattered over the lawn just before snow comes helps to keep the snow on over winter and also adds much needed fertility to the soil.

Milk Producers Ask Only Justice.

THE farmers of southern Wisconsin and northern Illinois, known as market milk producers in what is called the Chicago district, have been flagrantly maligned and abused because they have seen fit to ask for an advance in the price of market milk commensurate with the advance in the cost of production. It is easy to understand why the consumer in these times of high prices, is anxious to secure such a necessary food as milk at as a reasonable price as he can get it. Unfortunately, politics and the influence of the city press have entered to a large extent into this matter of fixing the retail price of milk in such cities as Milwaukee and Chicago. It seems to be very popular in Chicago for an attorney to jump up and down and crack his heels together and howl, "The farmers are robbing us!" It seems that a lawyer who will take this attitude can secure the applause of the city press. If he can go still further and threaten to indict a farmer or a bunch of farmers, then he is indeed a wonderful man and doubtless he can have his picture on the front page of the Chicago papers with encomiums as to his peculiar fitness for public service.

All questions relating to the price of such an important food product as milk should be decided on the basis of justice and this basis of justice should be extended to the three classes most interested in the production and sale of milk. These three classes are, first, the farmer who produces the milk; second, the distributor who takes the milk off the farmer's hands and carries it to the consumer's door; third, the consumer who pays for the milk and who must have it for food. Justice should be extended to all alike. Justice is a matter of principle and not politics. Justice must be based on facts and not upon oratorical pyrotechnics appealing to the prejudices of anyone of the three classes named.

All through this controversy affecting the price of milk the farmer has been asking simply for justice based on facts. To accomplish this, milk producers have found it necessary to organize. These organizations have been by local groups, centralized by a general organization or federation, both the local groups and the federations being manned by officers owning cows and producing milk, or by men directly representing this producing class. This organization work among milk producers is of comparatively recent origin. It has been established without the finesse which has characterized similar organization work among the great capitalistic enterprises of the country. The organizations were honestly formed and with no intention whatever of doing any damage to anyone. If any mistakes have been made, they have been honestly made. When it so happens that all the condenseries and all of the market milk buyers are agreed as to what the price of milk shall be, the farmer feels justified in assuming that there has been some mutual understanding among these interests. He has further assumed, whether rightfully or wrongfully let the readers judge for themselves, that he might also have some rights which would permit him to talk over the subject of the cost of milk and the honest fair selling price which should be resultant of the accurate knowledge of this cost with the addition of a reasonable profit. To say that because farmers take this attitude they should be indicted and ignominiously hauled off to jail is an outrage on the criminal procedure of our commonwealths.

It is gratifying to note that since the recent agreement between government and state officials and milk producers in Chicago and Milwaukee the matter of indictments, according to report, is to be dropped. The Wisconsin Farmer assumes, and we do not believe that it can be established successfully otherwise, that the rank and file of milk-producing farmers are willing to produce market milk at cost plus a fair profit.

The flurry caused by the recent indictment of officials of the milk producers' association has blown over and we believe it is the aim and intention of the steadier heads of the National Food Administration to give the farmers of Wisconsin and Illinois a fair hearing on the cost of producing market milk. A price of $3.22 per hundred pounds has been established for November and December throughout the Chicago district. This price has been agreed upon by the producers with, however, the mental reservation that the price is too low and that it does not compensate the producer for his costs, all items included, and a fair profit added.

On this page will be found a letter directed to The Wisconsin Farmer at our editor's request, by Mr. Milo D. Campbell, president of the National Milk Producers' Federation. Mr. Campbell is an honorable farmer and milk producer with an honorable record of good citizenship and loyalty to his country, and he fairly represents the vast majority of those milk-producing farmers, who are members of the association of which he is the head. Our subscribers are asked to read Mr. Campbell's letter carefully. The matter of milk prices is now in the hands of our government and it is the duty of milk producers to furnish our government with reliable and accurate information as to the cost of producing milk and when this information is furnished we have every reason to believe that the government will take a broad view of the case and give to the milk-producing farmers that price for market milk to which they are fairly and justly and reasonably entitled.

From the Head of the Milk Producers' Federation.

Milo D. Campbell, Coldwater, Michigan.

Coldwater, Mich., Nov. 12, 1917.

TO THE EDITOR WISCONSIN FARMER:

I am glad to seize every opportunity offered, to place before the milk producers of the country the reason for temporarily lowering the price of milk in the city of Chicago, and in New York. There is now upon us the burden of a great war in which every loyal man must do his part. Most unjust and brutal criticism has been made against the men who own and milk the cows of this country claiming that they were seeking to profit by the war instead of doing their bit. While the farmers have steadfastly denied this, while they have offered all kinds of proof that their milk was costing them all they were charging for the same, unfortunately for them, their proof has been suppressed by the great metropolitan papers, while in flaming headlines, farmers and their organizations have been condemned to depths of infamy.

Months ago, at the request of Food Administrator Hoover, an investigation upon the cost of producing milk, was conducted by a committee appointed by Mr. Hoover. The farmers welcomed this investigation, but for undoubtedly sufficient reason this committee has never reported.

The farmers, however, have learned from sources reliable, that in every locality where milk is produced, it is costing more than is being charged for the same.

This is because of conditions over which the farmer has no control. War and the seasons are not his to change. He finds that corn (the cow's principal food) has increased in value from 70 cents per bushel to $2.23; that hay has gone from $10 a ton to $20 and labor on the farm from $1.25 per day to $3 and upward. He knows that his fields are worth much more to him for other purposes than in producing milk; that he can sell his cows for fabulous prices for beef, and he wonders why he should become the one lone altruist in the great food problem.

The price of milk to consumers has nowhere gone up 100 per cent. But with a raise of milk price in the cities, without a reasonable inquiry into the cause for the same, ambitious politicians, unadvised newspaper reporters, and influential, but selfish consumers, began a merciless warfare upon this one article of food. They brought out anti-trust laws, made many years ago for big corporations, and trained them on the farmers.

There had never been known a trust magnate who could not elude them. Not one in the U. S. was ever in jail a minute, under them, while a billion dollars of trusts and combines were forming. As a result they indicted a milk committee in Chicago, and tried to do so in New York. But there is not the slightest danger to the milk industry, and the result will be that the organization of milk producers' associations will be doubled if not increased five-fold in the next year.

But at the request of the Food Administration in Chicago and New York public hearings are soon to be had upon the cost of producing milk. The Food Administration promises to appoint a fair committee, before whom the milk producers, the distributors and the consumers may appear and be heard. The inquiry is to be upon the cost of production, for no sane or reasonable man could ask the farmer to sell milk at less than it costs him to produce it. To this cost is to be added the profit that the committee shall decide to be reasonable. This is all that the farmers have been asking since the war began.

In the meantime, and while the commissioners are making their inquiry, the price asked by the farmers, averaging about $3.71 per hundred, has been reduced for the months of November and December to $3.22 per hundred. But it has been agreed that in case the commission shall find that the farmer should receive more than $3.22 per hundred for the months of November and December, the difference shall be spread over subsequent months.

Practically the same kind of hearing and under similar conditions will be had in New York as in Chicago.

It should be observed by the purchasers of whole milk over the country, that the price of $3.22 per hundred is below the present cost of producing milk as found by experts who have investigated the matter.

In fairness to milk producers the condenseries and others who fix the price for these months, should be willing to be guided by the arrangement made by the Food Administration of the country and make the minimum price agreed upon by these authorities the price over the country.

The government is paying for evaporated milk a price that will warrant a much better price for whole milk than $3.22 per hundred.

The farmer who sells milk has placed his business squarely up to the government, and has invited the most thorough investigation. He has said that all he wants is cost plus a reasonable profit.

If every other industry would do the same thing, the consuming public and the government would have less cause for complaint.

MILO D. CAMPBELL,

President, The National Milk Producers Federation

Breeding the Cholera Hog.

To the Editor:—There has been hog cholera for the past forty years and it is of recent years more prevalent than twenty-five or thirty years ago. Now I will give you my opinion and experience and I am well aware that my opinion will not be popular with a certain class.

We have, in my opinion and experience, been breeding the cholera hog and we have got just what we have made. We have been breeding too young males and females, crowding too early maturity, until the present hog has no constitution. Your hat or cap will easily hold the offal (when I was a boy and father killed a hog he would send me to the house after the washtub). I, however, am not advocating more guts, but I do think the guts should exceed the brain of a hog at least. It does not make so much difference when it comes to men. Again, we have been doing too much inbreeding, or perhaps I should say line breeding, and today our hogs are a hothouse production, forced from the day they are farrowed until sold in the sale ring (I have reference now only to our breeding stock). People do not think that it pays to keep over our brood sows and male hogs, which is a great mistake.

Some twenty-five years ago I had a fine registered Poland China sow farrow seven pigs on January 2d, and the 20th day of June she gave me nine fine pigs and one of her January litter farrowed six fine pigs in October. Now that's going some.

My farm has forty acres of timber hog pasture with plenty of good water. I have owned the farm since 1880 and never had hog cholera on the place during that time (but understand we have quit raising three litters in ten months). Yes, we have had hog cholera all around us, and our nearest neighbor lost 200 at one time. We now have about 150 or more of spring pigs and they are husking ten acres of good corn and making a fine gain.

Hog cholera serum and other hog cholera remedies may be a good thing for those raising the hog cholera hog, but surely they have my sympathy.

Supposing a farmer had a fine house and it should catch fire through a defective chimney and he would extinguish the fire after considerable damage had been done, and in course of time he should have another fire (same cause) and again he would extinguish the fire after a certain amount of damage. Then go to town and buy more fire extinguishers and after he had the third fire he would go and buy a fire engine. Now, honestly, don't you think it would have been better if he had repaired his chimney and removed the cause? You know there is always a cause where there is an effect.

Again I say that we have made the cholera hog. As we sow so shall we reap. Ole Olsen.

BADGER FARMER'S MAIL BAG
FARM EXPERIENCES

Hog-Raising Methods.

To the Editor:—I am pleased that you have had some discussion by the farmers of the swine problem, as this will give a chance for the practical swine breeders and feeders to get in closer touch with the different methods of feeding and caring for the animals that have come to occupy such a prominent place not only on the farm, but as one of the nation's quickest of meat and fat producers. I think could the farmer be sure of a reasonable return for the feed and work he would put in the business he could increase the amount of live weight 40 and possibly 60 per cent. I mean by raising more hogs and making them weigh at least 300 pounds before marketing them. It is, in part, the uncertainty of the market that causes so many light hogs to be disposed of, but with so much talk of a government price of $10 per hundred, and the price of all kinds of feed and labor so high and hard to get at any price, you can readily see why the farmer disposes of his hogs all the way from 150 to 250 pounds.

Of course, in some places, as in my locality, the corn is very light, as a rule, having been badly frosted, which will cause a shortage in weight of hogs on most farms. Then, again, how to increase the number of hogs. Farmers must have feed for them and I think a good pasture is one of the best and surest ways of producing hogs, as it saves a great deal of grain. I also think the hogs are more healthy on pasture. I would not try to raise a bunch of hogs without a good pasture and plenty of it. There are several kinds and as many ways to have it. Of course, if one can have alfalfa he is indeed a lucky man, but as so many of us are renters and live where the land must be inoculated before it will grow alfalfa, we must use something else. Of course, there is nothing that is quite as good, but most of the landowners would not consent to the expense of getting alfalfa started just for a renter. Therefore, I woud suggest if we are to raise more pigs we should not keep more brood sows, but keep better sows and give them better care. By this method we could save and raise a larger percentage of the pigs that were farrowed, and by good care, also, we could have our sows farrow not one litter a year, but two litters. This is especially true with old sows. I have some that have raised two litters each year for the past three years and are better mothers every time they farrow.

I think the man who farms 160 acres should keep not more than ten good sows, either high grades or pure breds. He would do well to keep every sow so long as she does well and has two litters each year. This way he could raise, with good feeds and careful management, from 125 to 200 pigs a year. Of course, this cannot be done with haphazard methods. Nevertheless, it has been done and can be done almost any time if one only has the right kind of brood sows and does his part. He must start with a pure-bred boar. I always use a tried hog—one that will get large litters. This is most important. I never keep a sow, no matter how good an individual she may be, if she has less than twelve teats, or fourteen are better. Then she must prove that she cannot only produce a large litter, but must be able to take care of them after they are farrowed. This is most essential to success, as I find there are a great many sows that can and do farrow large litters of pigs, but cannot care for them afterwards.

As for concentrated feeds, I think they are too high at present to justify a farmer of small means taking the risk. But there is always room on every farm for a few more good milk cows. These will always pay a good profit on their feed and care if they are properly handled, to say nothing of the valuable feed one gets from the skim milk, and if one has plenty of this he can get along nicely without such high-priced feeds, especially when it costs from $70 to $90 per ton.

In regard to hogging down corn, this is a very good and profitable way so long as they are not allowed too large a field at one time, or it is not practiced too late in the fall, especially in the northern part of the corn belt, as it may be covered with snow and cause more or less of a loss.

Floyd Co., Iowa. Charles O'Neil.

Five Hundred Bushels to the Acre.

To the Editor:—The writer has recently become interested in the matter of potato production, especially along the lines of developing quality and quantity and to stimulate the growing in this district to get large yields and better quality. In order to be practical in this matter I took what I figured was two acres of black sandy loam, and by fertilizing and plowing this particular tract eleven inches deep and double disking six times and cross disking four times made the land thoroughly mellow and after subsoiling it in this way I planted it to Triumph potatoes. In order that I might have my figures accurate and not make any false estimate I had a civil engineer measure the piece and Mr. V. H. Paradis, the engineer employed, has made affidavit that there was 1.94 acres in the tract used. We took from this tract this fall a total of 979 bushels of very high-grade Triumph potatoes. These facts I am able to substantiate with an affidavit by A. C. Thomas, a resident of the city of Rice Lake, Wisconsin, who made this affidavit on the 18th day of September, 1917, and swore to same before J. B. Demarest, notary public.

Believing that this is as good or better a yield of potatoes than anyone in the state of Wisconsin will be able to show, I am in hopes you will publish this letter in The Wisconsin Farmer. If there are those who have any better yields per acre, let them come along with the information.

Rice Lake Wis. Orrin Ingram.

In Brown County.

To the Editor:—I believe considerably more wheat has been put in this fall than has been sowed for several falls previous. This is due to some extent to the movement for increased acreage of all crops and especialy to the movement for increased wheat acreage. But the thing that helped most toward the increased wheat acreage was the surprising yields of both fall and spring wheat which the farmers of this section had when they threshed out their crop this year. These yields have been so good that our farmers are rather encouraged in the growing of wheat and I look for still further inceases next spring, although it seems that the fall wheat for our county is to be preferred over the spring wheat. As near as I can estimate there have been 155 new silos erected in this county this year.

Brown Co., Wis. E. A. Carncross.

Ventilation Helps the Cows.

To the Editor:—You wrote me regarding barn ventilation. In 1902 I built my first barn 24x50, then I built a shed on the north side 14x50. It was three double boarded with matched lumber and paper between. It had no ventilation. I used to leave the door open that led out on the driveway and when it turned real cold and everything shut tight it got so damp it would just drip off from the ceiling. I did not like this way one bit.

I have a sister living on a farm in Scandinavia, so I was down there visiting and I saw quite a few barns with basements along the road that had ventilation, and I read about it in the farm papers, so I finally decided to raise my barn and put a concrete basement under it 38x50, eight foot eight inch ceiling. There are fifteen windows, and I put three and three windows together on the south side and two and two on the north, two on the west and three on the east end, and I put intakes between the windows in the casings, which made eight intakes 4x5 inches. And I have one galvanized ventilator sixteen inches with a cupola on the top. I have my cattle facing the wall. This leaves the ventilator behind the two rows of cows and the intakes in the front. My cows are doing one-third more in this barn and I feel quite satisfied with it all.

Rosholt, Wis. C. E. Erickson.

Three Useful Machines

THREE International machines that will pay their way on any farm where there is corn to market or livestock to feed are:

An International Feed Grinder
A Keystone Corn Sheller
A Mogul Kerosene Engine

International Feed Grinders, for grinding small grain, corn on the cob, or corn in the husk, come in three styles with regular or special plates, 6", 8", and 10" in diameter. Capacities from 5 to 30 bushels per hour.

Keystone Shellers, adaptable to large or small ears, shell hard or soft corn clean without cracking the kernels or crushing the cobs. There are eight styles in 1, 2, 4, and 6-hole sizes, with capacities from a few ears shelled by hand, up to 4,000 bushels per day.

Mogul Kerosene Engines furnish steady, economical power for these and other farm machines. They operate on the cheapest fuels. Mogul kerosene mixers; built-in magnetos that make batteries unnecessary; enclosed crank cases; full equipment, ready to run; are features of all Mogul engines, from 1 to 50-H. P.

Equip your farm with a set of these three useful machines. See the local dealer or write the address below for complete information.

HORSE EFFICIENCY

Lameness can't be avoided, but its duration can be reduced by using Sloan's Liniment as soon as the horse goes lame. See how quickly this effective liniment relieves stiff, sore muscles, bruises and enlargements and puts your horse back into the 100% class. Thousands of farmers heartily endorse Sloan's Liniment, the universal relief for pains and aches.

Buy it at your dealers. 25c-50c $1.00

Just six times more liniment in the $1.00 bottle than in the 25c size. That's wise economy.

Sloan's Liniment

3,000,000 sold last year

Because they wear well; no hitch on shoulders, no pull on buttons—and *guaranteed.* If yours are not satisfactory—in every particular—mail them to *us.* We will repair, replace, or (if requested) refund your money. Buy a pair—any dealer *anywhere.* They're 50c. The highest possible suspender quality *at any price.*

Wisconsin Baby Beef Round-up.

(Continued from page 1.)

animal and, though his father had to assist him here and there, he was just as proud as though he were doing it without any help.

The order of the placing was as follows: 1st, Ted Scott, Bagley, Hereford steer; 2d, Will Radl, Short-horn steer; 3d, Harry Feaster, Richland Center, Hereford heifer; 4th, Gailen Babcock, Eleva, Short-horn steer; 5th, Henry Kurtz, Dane, Short-horn steer; 6th, Roland Webb, Poynette, Short-horn steer; 7th, Harold Hall, Edgerton, Angus heifer; 8th, Wayne Martin, Gotham, Hereford steer; 9th, Walter Farmer, Gilmanton, Hereford heifer; 10th, Martha Kelley, Mineral Point, Short-horn heifer; 11th, Charles Whitworth, Mondovi, Angus steer; 12th, Ethel Feaster, Richland Center, Hereford heifer; 13th, Ralph Joyce, Jewett, Angus steer; 14th, Carl Bailey, Bloomington, Hereford heifer; 15th, George Schofield, Edgerton, Hereford heifer.

Six girls exhibited animals in the two classes and they attracted no little attention by the manner in which they handled their animals. Especially noteworthy was the way in which Josephine Herr attended the Short-horn steer she had in charge. Though the judging required several hours, there was never a minute when she permitted her steer to stand in a wrong position.

There was no dissatisfaction on the part of those who failed to place in the money or those who failed to land among the top. Everyone felt that their efforts had been appreciated and that the amount of training received and the knowledge acquired during the eight months or more in which they prepared the animals fully compensated them for all the trouble.

Girl Makes Splendid Record.

Josephine Herr and the Short-horn steer she fed for the baby beef contest. The steer was placed second in senior class.

Two Prominent Short-horn Enthusiasts.

On the left, A. C. Halliwell, of the Short-horn World, and at his right, Frank W. Harding, secretary of the Short-horn Breeders' Association of America.

John C. Robinson, Evansville

Field Adviser for Wisconsin Baby Beef Contestants.

Several of the exhibitors have been winners at their county fairs and as such were assured of a free trip to the coming International Live Stock Exposition at Chicago, December 1st to 8th, through the courtesy of A. G. Leonard, president of the Union Stockyard & Transit Company, Chicago, and Thomas E. Wilson, president of Wilson & Company, Chicago. These men offer each year to the boy and girl placing 1st and 2d in the baby beef show at their county fair a free trip to the greatest live stock show in the world. This year's delegation from Wisconsin will consist of the following winners: Harry McCann, Janesville; Harold Hall, Janesville; Lee Jewell and Bree Fitzsimmons, of Mineral Point; Ralph Joyce, Jewett; Daniel Harbeck, New Richmond; Walter Hartman, Lodi; Harold Lintner, Arlington; Elwin Thompson, Lake Geneva; Leslie Doe, Beldenville; Clyde Taylor, River Falls; Gailen Babcock, Eleva; Walter Farmer, Gilmanton; Charles Skaife, Livingston; Ralph and Lloyd Williams, Bancroft; Alvin Morley and Howard Roser, Baraboo; Ted Scott and Frances Martin, Bagley; Harry Feaster and Wayne Martin, Richland Center.

On Thursday, November 15th, the animals were sold at public auction. Most of the animals went to the packing houses at exceedingly good prices. The lowest price paid was 13½ cents per pound and the top was 23 cents. The packing houses represented were Swift & Company, Armour & Company, Plankington Packing Company, of Milwaukee, and the Madison Packing Company. Some of the animals will, on the basis of this sale, appear more valuable than others which placed higher in the judging. However, this is due to the greater weight of some animals which even at a lower price makes them approximately worth as much as the winners in dollars and cents. The animals and the prices are shown herewith.

SALE PRICES FOR BABY BEEF.

Owner	Buyer	Price per cwt.	Weight	Value
Roland Webb	Armour & Co.	$16.50	625	$103.13

BUILT ON EXPERIENCE

For 17 years we have been building Simplicity Farm Engines. These engines made good right at the start because we studied the field and knew what kind of an engine conditions required. In the same way we built the Turner Simplicity Tractor—after a careful study of conditions and with the advantage of 17 years of manufacturing experience to guide us. Consequently, the

TURNER Simplicity

Tractor is one which you can buy with absolute confidence. It is built on sensible lines. It's a safe and sure investment, because all untried and doubtful features have been left out. It burns both kerosene and gasoline perfectly. Has a four-cylinder, tractor-built Waukesha Motor and heavy duty Hyatt Roller Bearings. Standard construction throughout. Powerful, yet no excess weight. Economical for small jobs. Easy to control—a tractor the hired man can operate. Thoroughly dependable—a quality tractor throughout.

Drain Every Swamp Acre You Own

War time profits demand that every acre be made more productive. Draining land doubles its value. But while you are at it, do a good job. Half the cost of draining is in ditching, hauling and laying the tile, and back-filling. Use the best tile you can get. It's poor economy to buy tile that shows heavy breakage in handling or that crumbles in the ground. Stopped up drains are worse than no drains. And replacing broken tile is expensive.

Use HAEGER Everlasting Drain Tile

The *standard* for *thirty* years. Strong, straight and well-burned. Once laid you needn't worry about *Haeger Tile Drain.*

GET THIS BOOK—It's called "Farm Land Drainage," and contains much of interest even for the practical farmer who is well versed in drainage methods. We have a copy for you. Just ask us for it. A postal will do.

Buy direct or through your dealer. Look for the "DIAMOND H" mark.

Family Circle Talks by the Publisher

(Continued from page 3.)

the letter I received. She said it was better than a Christmas box and more fun to see what they could do with what was in it.

Another party came from the city here with some friends in an auto and we filled the car with butternuts, apples, green tomatoes, wild grapes. We let them gather them themselves and the delight was more than pay for the trouble. One woman remarked, "You do not know what it means to get things we do not have to pay for, because we even have to buy our bittersweet in town."

There are old folks' homes that have to depend upon what is given them, there are many hospitals with free beds—places glad to pay charges on anything good we can send them. And there is many a housewife that could, if these places would furnish cans and sugar, make things for them out of what is wasted on the farms because of no market. The heavy winds this fall made many windfalls in apples that could have given fruit to many homes if one but knew of them. There were quantities of green tomatoes (because of the cold fall they did not ripen) that could have made nice relishes for anyone who could have used them. The farmer could not sell them and the city man paid $1.50 a bushel for them and sometimes more. Wild grapes grew in abundance this fall and would have made delicious cooling drinks for next summer if they had been gathered and bottled.

A good way to get things together is to have a county social. But box up the outgrown clothing, clean and nicely mended, and send to the Associated Charities. Be sure it is clean and mended.

All these are things we can give and are willing to give from the farm, but many do not know where.

EVA LEHMAN.

Here we have the way marked out for us to systematize our charitable efforts and to make them hit the mark. There is so much that we of the farm may do to relieve distress and suffering, both in town and on other farms at this time of the year. Shall we make this department of mine a sort of amateur associated charities organization to bring the needy in touch with the generous, those who lack in touch with those who have in abundance? May I count on your help?

THE GIFT OF PUBLIC SPEAKING.

I OFTEN think that one of the finest gifts granted to a man in public life is the happy faculty of knowing what is appropriate to say on a public occasion and how best to say it. Perhaps it is because I am conscious of my own deficiency as a public speaker that I admire this talent so much in others. At the period of life when most young men are studying the art of oratory I was working to help support our family, after my father had given up his life for the stars and stripes near Vicksburg. Later the demands of business deprived me of any opportunity to devote the time to acquiring the knack of public speaking which I have so greatly missed.

But, in spite of my own shortcomings along this line, I have formulated in my own mind three simple rules for successful public speaking. I suppose I have done this on the same principle that men who have never been successful themselves often write books for others on how to succeed. My three rules for public speaking are these: First, have something to say; second, say it; third, stop talking. If some of our statesmen would follow these three rules their audiences would be spared a lot of weariness, and the Congressional Record would be greatly reduced in size, without anything being lost to the sum total of human wisdom.

Abraham Lincoln was a master of knowing what to say, how to say it and what to leave unsaid, and his Gettysburg speech is one of the shining gems of pure oratory, because of its perfect simplicity, appropriateness and brevity. This same happy faculty of condensing a great deal into few words has been exhibited by General Pershing on more than one occasion, and never more effectively, it seems to me, than when he paid a visit to the tomb of Lafayette in France the other day. He was accompanied by a delegation of French and American dignitaries and the scene was set for a dramatic and notable event, of which General Pershing's tribute to what Lafayette's help meant to the United States in its struggling days of the revolution, was to be the chief feature.

It seems to me that his remarks, which consisted of just three words, caught the spirit of the occasion with a sense of the eternal fitness of things that amounted to an inspiration. Laying a wreath on the tomb he said, only this—

"Lafayette, we're here!"

That was all, but what a wealth of sentiment and meaning in those few words of soldierly simplicity! How much more fitting than a long-winded address for giving expression to what was in the hearts and minds of everyone present! What a delicate, tender acknowledgment of the fact that the young, weak nation, which Lafayette had helped in its struggles against oppression, was prepared in the days of its strength to repay the obligation, fourfold if need be, to his beloved but desolate France. It was as if he had quoted the poet's words:

Last come, we will be last to stay,
Till right has had her crowning day.
Replenish, comrades, from our veins
The blood the sword of despot drains,
And make our eager sacrifice
Part of the freely rendered price
Ye pay to save humanity—
Ye pay to make our brothers free.
See with what proud hearts we advance
To France!

I know of no better application of the three rules for public speaking, which I mentioned above, than General Pershing's words. They are worthy the best traditions of the American army and of American taste. If General Pershing is as good a military man as he would be a diplomat, our boys "over there" are in good hands.

A HANDBOOK OF PATRIOTISM.

THERE is nothing more inspiring to real patriotism than a realization of the glorious history which all Americans share—both native born and adopted sons and daughters. Sometimes I think we fail to appreciate what a wonderful heritage is ours. So much attention has been paid in our schools and colleges to a study of older countries, "to the glory that was Greece and the grandeur that was Rome," that we do not realize that the United States has filled its comparatively brief span of national existence with epoch-making events, that are worthy our admiration and commemoration.

This fact was brought home to me with new force the other day, as I glanced through the pages of a pamphlet entitled "Every Day a Patriotic Day," compiled and published by Senator J. M. Lindly, of Winfield, Henry county, Iowa. Senator Lindly has discovered that every day in the year is the anniversary of one or more interesting and important events in our nation's life, and he has prepared a calendar showing these events by days and months. In this manner occasions for special exercises of a patriotic character are easily suggested to schools, churches, farmers' clubs, fraternal organizations and other organizations.

In a stirring introduction to his pamphlet Senator Lindly calls attention to something which should stir the pride of every citizen of this country, no matter whether it is the land of his birth or of his adoption, when he says:

It might be well, under present circumstances, to call attention to the fact that the English speaking peoples have led the world in literature, science, invention, in the establishment of civil and religious liberty, and in Christian and benevolent activities. Blot out the English speaking peoples from history and you blot out the most brilliant constellation of literati, headed by Shakespeare, Milton, Tennyson, Longfellow and many others; you take from the world the railroad, the steamboat, the reaping machine, the great spinning inventions that made clothing beautiful and cheap, the telephone, the electric light and many of the greatest scientific discoveries. In a list of one thousand celebrities, compiled about 1886, including the whole span of history, from ancient times, Great Britain and Ireland led with 283 names, the United States with 248, making 531 names for English speaking peoples, being more than half the list. France came third with 139 names, Germany with ninety-five, Italy and Ancient Rome with ninety-four, Greece fifty-one, Scandinavian peoples eighteen, Holland seventeen, Spain fifteen, Austria-Hungary eight, etc. We are enjoying a priceless heritage that we must preserve inviolate.

Surely, my friends, such facts as these are worth remembering and should arouse us to an appreciation of the splendid birthright which is ours. Such institutions, such a history, are worth living for—yes, and worth fighting and dying for, if need be.

Senator Lindly is a busy man, with extensive banking, farming and commercial interests, and he deserves the gratitude of the public for taking time out of his busy life to drive home such a patriotic lesson. His pamphlet should be in the hands of every pupil in our schools and in every library. I might add, incidentally, that Senator Lindly has been one of the members of the last two sessions of the Iowa legislature who has stood firmly for the interests of agricultural Iowa, in advocating and voting for honest, economical and efficient government, and I want to express here the hope that the state may continue to have the benefit of his wise and patriotic services in general assemblies yet to come. The nation needs more such men as Senator Lindly in public life during the critical days just ahead.

A TRIBUTE TO THE COLT.

I LIKE to liven this page of mine, every little while, with a poetic gem, gleaned from every possible source. I am going to print one this week which has the Riley touch, although it was written by another; a poem which puts into words the love that wells up in many a farm boy's heart for the whinnying little colt, begging for a lump of sugar, rubbing his nose against his master's shoulder, as cute and as lovable a bit of life as ever drew breath. Here is the poem for your enjoyment:

Gosh, I like to git a-holt
Of a dad burn little colt!
Soft nosed, dish faced, big eared booger,
Beggin' fer a lump o' sugar
Or a piece o' apple core—
Reg'lar de'il he is, for shore!

Neck too short an' legs too long,
Back all wavy, short and strong,
Kinky tail—there! See 'm flip
That mischievous upperlip,
Fairly achin' fer a nip
Out o' baby's tender hide
When 'is daddy lets 'im ride!

You may doubt it, but, says I,
They's a twinkle in th' eye
Of a colt, when he sneaks up,
Softer footed than a pup,
Nuzzles off yer old straw hat,
Runs away as quick as scat!

Makin' faces at 's mother—
Al'ays up to sumpin'-nuther,
Ornery, but yit, confound 'im,
I jest love t' fool around 'im;
He's so careless an' high-strung
An' so—well, doggone it—young!

I wish my readers who find such poetic gems in their readings would send me a copy, or tell me where I can get them. We should all enjoy them together, while the long winter months soon coming make reading unusually delightful and entertaining.

James M. Pierce

Wisconsin Potato Yields.

The latest estimate by W. F. Callander, field agent for Wisconsin of the United States Department of Agriculture, shows that the total production of potatoes in the state this year is 36,400,000 bushels. This is the second largest crop in the history of the state. In 1914 nearly 38,000,000 bushels of potatoes were raised and the average yield per acre at that time was 124 bushels. The average yield per acre this year is 114 bushels. The following table shows the acreage per county, the average yield per acre and the total production for each county:

County	No. of acres	Average yield per acre, Bu.	Total production
Northwest District			
Barron	10,200	139	1,417,800
Bayfield	3,100	150	465,000
Burnett	4,450	115	511,750

Waukesha	6,200	121	750,200

The foregoing does not include the acreage planted to potatoes in city and village gardens, which, if included, makes an estimated acreage for the state of 319,000 acres, with an average yield of 114 bushels.

Sheep for Bayfield County.

A consignment of well-bred four-year-old Hampshire ewes was recently received in Bayfield county. These sheep were put out on farms near Maple, the purpose being to distribute the ewes to farmers who were anxious to get started in the sheep business. Mr. James Trumbull, of Superior, bought most of these sheep in the Dakotas and Montana.

Advice on Sheep.

The Wisconsin station advises buying ewes now. In fact, they should all be bought before December 1st. In tending sheep exercise the right care. Keep the sheep off low, wet lands and rotate pasture fields to avoid parasites. Corral sheep at nights to prevent losses from dogs. Shelter sheep from spring and fall rains and do not overlook available pasture lands. The "Shepherd's Calendar" should be secured from the Wisconsin College of Agriculture, Madison, Wisconsin, and tacked up in the sheep shed for ready reference.

LEARN STEAM AND GAS Engineering

A GREAT DEMAND—$7 to $11 per day. This is the largest and best equipped steam and gas school in America. Also AUTO mechanics courses. Write for big new catalog.

ENGINEERING COLLEGE,
Dept. S. G. Austin, Minn.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

Questions and Answers.

Using Kerosene in Radiator.

Would it be advisable to use kerosene in the cooling system of a Ford car as an anti-freeze solution in place of alcohol and water?

Answer.—We do not advise the use of kerosene for cooling automobile engines, as there is some danger of fire and the kerosene soon ruins the hose.

Size of Propeller.

I have a four-horse-power motorcycle engine with which I wish to construct an ice boat, using a propeller. Would you please tell me the size and pitch of the propeller and the size of the pulley on the same, having a six-inch pulley on the engine?

Answer.—Make the propeller of laminated wood, having the center very strong and the ends about one-fourth of an inch thick. The propeller should be about thirty inches in diameter, the blades having a pitch of about 40 degrees. Use a six-inch pulley on the propeller with a six-inch pulley on the engine, the engine running at about 750 R. P. M.

Size of Dynamo and Motor.

What size of dynamo would I require to charge a battery of sufficient volts to drive a one-half horse-power motor? Would the motor be strong enough to drive a feed grinder that requires a three horse-power gasoline engine to operate it? Will the motor work well driving a pump jack? Please tell me the sizes of the battery, dynamo and motor required to drive the machinery mentioned.

Answer.—If the one-half horse power motor is run only for a few hours occasionally, a thirty-two volt, ninety ampere hour battery should be sufficient. If the motor is to be used several hours at a time when the generator is not running the battery should be thirty-two volt 12 ampere hours. Or a system of lower voltage could be used, with a greater ampere hour capacity. The generator should have a capacity of at least one-fourth kilowatt. It would be advisable to run the generator when the motor is running, though not absolutely necessary with the above size battery.

The one-half horse power motor would drive the pump jack, but the feed grinder would probably be too much of a load for it. A one-horse-power motor would be required, which could be operated by a one kilowatt generator. We should recommend for your requirements: One one-kilowatt generator, one one-horse-power motor, one one-half horse power motor and one thirty-two volt 120 mpere hour battery. Run the large motor from the generator and the small motor from the batter

Electric Equipment for Saw Mill.

I have a saw mill and I am running the same with a twenty-horse-power steam engine. It has not power enough. I would like to know whether I could get an electric dynamo and motor, and run the dynamo with the steamer. How many horse power would the electric dynamo develop by getting one large enough to make a full load for the steamer? Is one electrical horse power as strong as one steam horse power for mill work? Would it be cheaper to buy a new boiler and engine?

Answer.—You cannot increase your power by converting steam power into electricity; you will lose power instead. If your steam engine only develops twenty horse power, your electric generator could only produce about seventeen horse power, as some power is lost by friction, electric leakage, etc. If your generator delivers seventeen horse power to the motor, the motor cannot be expected to deliver more than fourteen or fifteen horse power to the belt. One electrical horse power is equal to one steam horse power; on account of its constant pull and ability to withstand overload, the electric motor is superior to the steam engine where electric power is available.

Whether or not you should buy a new engine and boiler will depend upon the condition of your engine. You might be able to considerably increase the power of your present engine by having the valve scraped to its seat and accurately set. If your engine is well built, you might be able to discard your present boiler and buy one for higher pressure steam, using your old engine and gaining more power from the higher steam pressure. Lagging the steam pipe and steam chest with asbestos or felt might add somewhat to your power.

Size of Pulley.

I want to mount my gas engine so that it will pull itself. The engine runs 450 R. P. M. and has a pulley twelve inches diameter and six inches face. The drive wheel that I am going to use is thirty-two inches diameter. Attached to the drive wheel is a twenty-eight-tooth sprocket. This sprocket is run by a chain from a seven-tooth sprocket on a jackshaft. What size pulley should I use on the jackshaft to make the outfit travel three miles per hour?

Answer.—With the above arrangement you would require a pulley forty inches in diameter on the jackshaft. It would be better to use a six-inch pulley on the engine and a twenty-inch pulley on the jackshaft.

Leaky Stay Bolts.

Can leaky stay bolts be riveted so that they will hold; or is it best to put in new bolts? How are new bolts put in?

Answer.—A leaky stay bolt may be calked so that it will hold if the bolt is not broken. Always have a heavy weight held tight against one end of the bolt while riveting the other end. Small leaks around a bolt may be stopped by pushing the metal of the plate up tight against the bolt by means of a blunt-pointed cold chisel or calking tool. If you are suspicious that the bolt is not in good condition, lay a straightedge on the plate both on the outside of the boiler and in the firebox near the bolt. If the plate is bulged the bolt should be replaced.

To replace a stay bolt, it is first necessary to remove the old one. To do this, drill a hole in the end of the bolt about two-thirds the diameter of the bolt. Drive a square plug in this hole and by means of a wrench on the plug, screw the bolt on through if possible. If this cannot be done, drill a hole in each end of the bolt as large as possible without injuring the threads in the plate. Then carefully clip the bolt out of the threads with a diamond-point chisel, avoiding injury to the threads of the plate. After removing the bolt it is best to retap the threads if a tap is obtainable, which is seldom the case on the farm. Screw in the new bolt, which should fit the threads tight, and saw off the ends of the bolt so that each end sticks out past the plate about three-sixteenths of an inch. Carefully rivet the ends over with a light hammer. Be sure to have a heavy weight against the other end of the bolt while riveting. Avoid putting a heavy strain on the bolt or on the plate while riveting. Hollow stay bolts, or stay bolts with the ends drilled are often used. The advantage of this is that when a bolt cracks, steam escapes and gives warning that the bolt is broken.

Three-Wheeled Race Car.

I have an old-style chain drive, two-cylinder Reo car which I am thinking of making into a three-wheeled racing car. I want to carry two passengers and travel from five to seventy miles per hour. Will this work?

Answer.—We do not consider a three-wheeled race car safe, as there is too much danger of its upsetting when turning a corner rapidly. Your engine is not designed for speed, and we doubt that your car would have power enough to pull two persons at 70 miles per hour.

Starts as easy at 10° below as 90° in the shade

You know that the cost of gasoline has become alarming. The consequent heavy strain on agricultural industry, is serious.

To meet this condition, the Evinrude Motor Co. has built a kerosene and fuel oil farm engine which has reduced the cost of fuel consumption by four-fifths.

The 3 H. P.

Evinrude Oil Engine

(unconditionally guaranteed)

operating on fuel oil, averages a cost of eleven cents per 10 hour day. All of the old difficulties of ignition, carburetion and starting have been entirely eliminated.

The Evinrude Oil Engine has neither carburetor, mixing valve, batteries, magneto, timer or spark plug to get out of order or cause annoyance. The fuel is introduced directly into the cylinder and is ignited by the extreme heat of high compression. More than twice the degree of heat necessary for ignition is generated and the engine starts equally well in intense cold or extreme heat.

We believe that you will be interested in a farm engine of such simplicity, exceptional economy and high class workmanship. At least allow us to send you a catalog.

Starts and runs on kerosene, fuel oil or any oil that flows.

Now Being Manufactured in Several Sizes

DEALERS: Responsible dealers are invited to write for full information as to exclusive territory.

GOOD MEN WANTED TO LEARN THE AUTO BUSINESS

Any ambitious, capable young man can make a success for himself, and if you will only prepare yourself, you will get work, because positions are open, waiting for competent men to do Auto and Electrical work.

The American Auto College develops your talent for a splendid, big paying trade. Our course has been enlarged with lots of new work—principles of Knight Motors, 8 and 12-cylinder Engines of new models, Tractors, new Starting Systems, Magnetos, Wiring, Coils, Welding, Brazing, Lathe work, Milling and Drill work, Tool making, Overhauling and Repairing, and all the newest, up-to-date Auto equipment.

AUTO College

$900 TO $3,000 SALARY OR BUSINESS PROFITS PER YEAR

Positions Are Open Tinker repair men are let out as fast as good men are found to take their places. Garage men, letters and telegrams come to us asking for good men. Just prepare yourself and your future and success will be started. Think of the good time, and the money you can make.

LIFETIME OPPORTUNITY—It's up to you to be either a common, hard-working laborer or else learn a good business. Thousands of men will go into the Auto business within the next year. Be one of them. We want you to. Get started right away. Learn here where the opportunities are greatest and best, by our system of actual work in our large shops. No books used; we furnish tools. You do the work yourself. Our men learn easily and quickly because practical work is the best.

Big Electric Starter and Tractor course FREE with the regular Auto course. Write for our big FREE Catalog now

AMERICAN AUTO COLLEGE, 406 Auto Bldg., OMAHA, NEBRASKA

No Money In Advance

A FULL YEAR TO PAY

Nothing to pay for 60 days—then only first small payment if you accept our offer on famous Majestic Engine.

Most powerful engines for their H. P. rating. Any size you want. Fewest parts, most durable, most economical. You can prove it before you buy or send a penny. Thousands of Majestic Engines in use.

30 Days Free Trial We will send any size engine you want. Send no money in advance, take 30 days' trial, then if satisfactory keep the engine, make first payment 60 days after its arrival, pay balance in payments 60 days apart. Return the Majestic at our expense if not the best engine you ever saw. Send post card now for FREE CATALOG, prices, no money in advance easy terms and our special offer. Let us send you valuable inside facts about gas engines—all free. Write now.

UPPER WISCONSIN

Clearing Sandy Land of Stumps.

To the Editor:—About a year ago Mr. Alex Graham, of Gladwin, Michigan, bought forty acres of typical sandy white pine stump land about a mile out of that town. The land was covered with big pine stumps ranging all the way up to four feet in diameter and averaging about forty of them to the acre. After thoroughly investigating all the local agencies used for land clearing and drawing on his fund of knowledge attained from years of experience, Mr. Graham decided on the following methods to get rid of his stumps.

First he secured the necessary irons, chain and blocks to build a tripod stump puller (sometimes called steelyard type). He made the wooden parts himsef. Mr. Graham, however, determined to have a piling as well as a pulling arrang ment on his machine, so he made that attachment by simply extending the front leg of the puller tripod an additional seven feet beyond its junction with the other legs. By placing a block at the extreme end of this extension he was able to use the machine very effectively for piling as well as for pulling and thus did away with the bother of having two machines. The picture shows the chain threaded for piling. The lower block is the one used to lift the steelyard arm in pulling the stump.

Horses are used to operate the puller both for pulling and for piling. The two side legs mounted on wheels at the bottom are each twenty-one feet long and the front leg mounted on a skid is twenty-eight feet long. This type puller is very familiar to all people in stump sections and we will not go into detail as to its construction. Our interest lies chiefly in the method and cost of use.

Mr. Graham first uses a charge of from one to three pounds of dynamite directly under the center of the stump, exploded with cap and fuse, and then pulls the stump. He finds that the use of the explosives splits it, loosens the dirt from the roots, makes it pull easier and aso gives better chain holds. Then when pulled it is in pieces small enough to be handled with the piler.

The other picture shows the large windrow of blasted and pulled stumps which Mr. Graham has piled through the center of the field and the crop of beans growing on the cleared land plowed for the first time this year. These stumps are to be used for firewood. Mr. Graham operates a hotel in Gladwin and finds that he can quite materially lower his fuel cost by using stump wood in place of paying high coal prices.

The clearing of this land will not cost over $20 per acre and probably not that much. Mr. Graham has been offered more than double the original cost price of the land since clearing it. From quite an extensive study of conditions in the cut-over sections of Michigan, I am inclined to believe that the use of this type puller in connection with dynamite is about the most economical method that can be followed in getting rid of large pine stumps on the sandy lands of northern Michigan. On the clay lands a large number of farmers tell me that the use of dynamite alone is the most economical method. Guy G. Means.

FURS

Advanced Registry and Improvement.

It is in the advanced register that dairy cows show their individual superiority. While it is a fact that any cow from pure-bred ancestry can be registered, it remains for the advanced register to separate the high producer from the low, to distinguish the meritorious from the inferior and to eliminate the unprofitable producer from the pure-bred herds of our country.

To those acquainted with advanced registry work it is sufficient to say that it consists of a record of a cow's production for a stated period of time under supervisory methods established by the record associations. Naturally rules vary somewhat and it would be inadvisable to reprint them at this time. Each man who has cows he would desire to have tested in accordance with advanced register rules had best write the record association with which his stock is registered or else write the dairy department of the agricultural college in his state. The record associations publish magazines at regular intervals or else publish reports that are interesting and helpful to any man, and these may be secured for the asking or for a samll fee.

Advanced registry tests are divided into four principal classes—one day, one week, one month and one year. Standards are established by which a stated amount must be produced in the particular length of time the test is to be run if the cow is eligible to registry. Those classes are subdivided according to the age of the cow on test. A two year old is not to be expected to produce as much as a mature cow and the rules are made in such a way that each is put on a fair basis of comparison and competition.

The advanced registry record in which there is the greatest interest shown is that made by the mature cow on a full year's test. Others are valuable, but there is a belief that the long record shows persistency, and inasmuch as the cow is on record through practically her entire lactation period her real merit as a producer is shown. World records on yearly tests have won fame to cows and to their owners and to the breed. For years the annual record hovered around 1,000 pounds of butter fat. Holsteins, Jerseys and Guernseys had their breed records and each had its famous cow which held world renown. Then almost with one accord records began to push upward. Cows made new world records to hold them for only a few days. So frequently were new records made that there was scarcely time to duly exploit the new queen of dairy production. There were those who believed that no cow would ever produce more than 1,000 pounds of butter fat in one year. That mark has been so badly overstepped that it is impossible to estimate the final limit of production.

We cannot expect every cow to approach the high mark set by a few, yet that fact need not lessen the value of establishing a record in every herd. There is probably no more helpful distinction that may come to any herd than to have every cow of a herd in the advanced register. Just as 1,000 pounds was once the goal for yearly record on phenomenal cows, so was 400 pounds arbitrarily set as a mark for a herd average. That average was finally reached and then began an effort to secure for every cow in the herd a record of 400 pounds or better. Now there are herds in which the 600-pound average seems possible of attainment.

The preparation of a cow for advanced registry test is as important as is the training of a race horse for the track. The dairyman experienced in advanced register testing will no more think of starting his cows on test without having all conditions right than will the race horse man start the fall circuit without months of strenuous preparation. A rest preceding calving is deemed necessary in order that the cows shall enter upon the test in the most vigorous manner possible. Eight or ten weeks is usually considered to be the proper length of rest. During this time it is well for the ration to be somewhat fattening, although this must not be overdone. This preliminary period is ideal for discovering the likes and dislikes of a cow's appetite. She must have foods that she likes or else she cannot be forced to her maximum production. The ordinary plain feeds are usually best. Bran, ground oats and corn meal fed with silage and alfalfa hay may be taken as a standard, allowing such deviation as market prices may justify.

The cow on advanced register requires special care and attention. A regular routine must be established. Feeding is to be done at regular intervals and milking time must not vary from the established periods. Usually the cow on advanced registry test is milked three times per day. However, there have been cows where they have been milked as many as six. For ordinary practical herd management three times are sufficient. In the amount of exercise practice has varied. However, in the majority of cases some exercise is provided. It not infrequently happens that the cow is allowed to be in an open lot or small pasture for three or four hours each day in warm weather or is in an open shed for an equivalent time during winter. On the other hand, cows have done very well when they had no exercise except what could be secured in a box stall. It is doubtless easy to permit a cow to take so much exercise that it would be detrimental. It is quite a common practice to blanket the cow during the test. However, public opinion is opposed to heavy blanketing and some record associations have voted that the use of more than one blanket on an animal during test shall be forbidden.

The belief that cows that freshen in the fall will produce the greatest records is adhered to quite generally. However, great records have been produced regardless of the time of calving. In the short tests especially do the owners desire their cows to be ready for the test during cool weather and very seldom will they attempt to make a short-time test in warm weather.

Tests must, obviously, be uniform in order to be of benefit to the public. With this in view and in order to remove from the public mind any suspicion of irregularity the record associations have provided that the state agricultural colleges shall supervise all testing within the state. When preliminary arrangements have been completed the college sends a competent man to supervise the test and to make correct report concerning same. Naturally there is expense to the owner of the cow. However, there is value received in this because of the information gained for his own use in prestige gained by having his cows in the advanced register. One young man who lives in a remote and almost inaccessible corner of his state has succeeded in putting twenty of his cows in the advanced list. He believes that he was entirely justified in all the expense necessary to do this and indications are that he will be repaid with enormous interest.

It is no longer enough to have or to buy cows that are pure bred. The time has come when the advanced register record is as essential a part of the qualification as is the tabulated pedigree. Advanced registry work is growing rapidly. It is well that this is the case, for it really is a "Register of Merit," as one record association terms it. Doubtless this line of work has been one of the greatest factors in the marvelous advancement our dairy breeding has made. There is nothing but commendation for it.

Community Effort in Dairy Breeding.

United effort is rapidly coming to hold a very important place in progressive dairy movements. It has been through united effort that the country of Holland and the islands of Guernsey and Jersey have produced the greatest breeds of dairy cattle in the world. The people of those lands have centered their efforts upon their particular breed and have not permitted anything to swerve them from advancement. One breed and high production of cattle within the breed is the motto and the practice that has put them to the forefront. In our own land we find localities where breeders have united to handle on their farms one particular breed and to push its interests to the front. This has resulted in making these localities famous as localities in which cattle of that particular breed could be found. The result has been that so far as the selling of pure-bred stock is concerned these localities have found sales more readily with less expense for advertising and satisfactory prices.

Community effort means standardization. It will do away with scattered effort and mixed breeding. Once the leading men of a community have adopted one particular breed of cows and have centered their energies upon it the other men of the community will follow just as soon as they are able to see the merits of coöperative work and also to see the merits of improved stock. It is a significant fact that in localities where the one breed standardized method has been adopted

My New Big 1918 Book

WRITE for Your Copy —it's FREE

Again Tremendous Savings

Once more I come to you with my great offer of the highest grade implements at lowest manufacturer's prices. In the face of rising prices, my savings are more important to you than ever before. I still "divide the melon" and name low prices because I sell

Direct from Factory to You

Stop where you are if you are wasting money by paying two or three prices. Get my new 1918 Book and read why you can get the finest implement built at a saving of 25 to 35% and how I can do it. The whole secret is in my direct-to-you method. I sell you at the lowest manufacturer's price with only one small profit based on a tremendous business. My plan is, cut out all waste and lost profits between the actual maker and the actual consumer.

SEPARATORS

Perfect skimmers. Easy to operate and clean. Runs true in perfect alignment always. Absolutely sanitary. Every drop of milk gets full skimming force of bowl—all working parts run in oil spray.

180 Milkings Test

Yes, sir! Try it! Test it—compare it for 90 days on your own farm. Make my new 1918 Sanitary Model prove by the work it does that it is the separator you want. It has them all beat for real separator efficiency. This 90-day test will prove it to you.

SPREADERS!

Wide Spreading V Rake—Low Down

Before you decide on any spreader at any price, find out all about my new low down model with its wonderful spreader features and real spreading efficiency.

HAS EVERY NEW IMPROVEMENT

New steel beater and wide spreading V-rake pulverizes and tears the manure to shreds. Patented roller-feed. Spreader is easier handled with two horses than others with three and four. Patented automatic stop and uniform clean-out push-board make spreading easier and more thorough. Tongue is of pressed steel—indestructible. Adjustable from 4 to 24 loads per acre. Has double chain drive direct from rear wheels.

ENGINES!

Develop way above rated horse power. Big bore, long stroke. Valves-in-head like fine auto engines—no lost energy. Uses any fuel. Large, heavy, counter-balanced flywheels. Make and break ignition, never misses fire, easily started—no cranking. Cylinder and water pot frost proof. Scientifically built.

Heavy or Light Work Models—1¾ to 16 H.P.

There is a Galloway engine for any farm work, from the light 1¾ pumping engine—the light work 4 h. p., 6 h. p.—the heavy duty 9 h. p. and 12 h. p.—to the big 16 h. p. Mogul engine for the toughest job you have. And I make them all in my own factories.

TRACTORS

12-20 Size

Burns Kerosene or Gasoline

The Galloway Tractor is the peer of all. No freaks, no frills—but an honestly built tractor for tractor work. Has anti-friction bearings—21 sets Hyatt roller and ball bearings.

Takes only 13½% of motor power to pull tractor—25 to 35% less than others.

DOES ALL FARM POWER WORK

Plows, discs, harrows, hauls, threshes, saws, grinds, shreds, grades roads, fills silos, pulls three 14-inch bottoms 8 to 9 inches deep in clover or timothy sod. Driver has control at all times. Does anything a 12-horse team or 20 h. p. engine will do.

WM. GALLOWAY President WM. GALLOWAY CO.

When you write mention Implement interested in. This is important. It means you will get the exact information you want.

When writing to advertisers kindly mention The Wisconsin Farmer.

that a large proportion of sales have been made to men in the locality who have seen the light of better practices and have decided to join hands with their neighbors. One man in commenting upon this has said, "The crying need is for unity of effort on the part of farmers whereby standard sorts of dairying cattle can be established in communities, in the place of multiplicity of varieties that now fill the landscape."

Racine-Kenosha County Milk Producers Meet.

It was a sort of harmony meeting which was held at Racine on Saturday, November 10th, and attended by about 500 members of Racine and Kenosha county producers' associations.

Frank T. Holt, president of the Chicago Milk Producers' Association, the parent organization, was in charge of the meeting. He stated at the opening that this was not a meeting for increasing the troubles of the consumer, but merely a gathering of the two county organizations, in order to straighten out to the satisfaction of the members the whys and wherefores of the November and December price for milk as fixed by the Wisconsin milk commission in conjunction with producers and distributors at Chicago. Thomas M. Kearney, senior member of the firm of Thompson, Meyer & Kearney, of Racine, was the chief speaker. He reviewed some of the vital points which the recent milk agitation has brought forth. The court hearing at Racine which has twice been postponed and which has for its object the dissolution of the milk producers' organization in Wisconsin, will, in the opinion of Mr. Kearney, not be pushed by the state in the future. He quoted letters from the governor and from Attorney-General Owen, in both of which assurance was given that the law regarding farmers' organizations, which at the present time is too stringent, will be amended at the next session of the legislature.

Mr. Kearney brought out also that the milk producers' association of Chicago appealed to the food administration as early as last August to consider the fixing of prices on all fluid milk. The administration at that time did not deem the milk problem of enough importance to warrant an investigation on their part. However, the last "milk war" has brought this about and the November and December prices of $3.22 per 100 pounds were agreed on only after the administration had promised to reimburse the dairymen supplying the Chicago market for all losses sustained on account of this lower price by assuring a liberal price on milk in the first six months of 1918.

An honest understanding is all that the producers desire, according to Mr. Kearney. There is no idea among the producers to take advantage of war conditions to force unreasonable prices. There is n t a disloyal h t in the localities involved in this agitation. "We are not afraid of court investigations; in fact, we welcome them. Grant us, however, all assistance and coöperation in this work," said Mr. Kearney. "That is all we ask."

In speaking of the suit, even though it might never be held, Mr. Kearney said: "Avoid all acts and statements which will prejudice your case. Your case is now before the food administration, which body is investigating from top to bottom all points of the controversy. Do not by any word or act bring about a situation which will influence the people or the courts against you."

Some of Mr. Kearney's other statements were: "There is a patriotic purpose behind the efforts of the producers in asking for an investigation." "The farmer need not pledge and repledge his loyalty to the flag during these times. He has responded wholeheartedly to the appeal of the government for more food. He has, in the case of the milk producers in particular, sought the government's help to establish a fair, living return for his product. He will continue to show his loyalty to the flag with his last dollar and his last drop of blood. The government does not expect him to work at a loss any more than a manufacturer of war material."

Attorney Riley, of Madison, and Assemblyman Vincent, of Kenosha county, spoke much along the same line, emphasizing in particular the great need of an early understanding between the public and the producer. Grain farming is to all appearances a better type of farming at the present time than dairy farming. Mr. Vincent is not at all convinced that dairying will not receive a severe setback because of the labor problem, which the dairymen must solve and are solving

60 Million Dollars to be Saved in Wages by the American Dairy Farmer in the first year of our Great War.

Military authorities agree with U. S. Senator McCumber that the war will put *five million Americans* into the trenches. Dairymen are asking themselves what they are to do for labor.

Selling the milk cow for beef doesn't appeal to the dairyman. He is not in the habit of dodging a problem.

EMPIRE MILKING MACHINES

In Canada, labor-saving machinery is solving it. Tractors, milking machines, gasoline engines are at work by the thousands.

What Canada buys is also significant. Take the matter of milking machines. Much attention is given to labor-saving and time-saving, economy of upkeep and long-wearing ability, but the important consideration is the welfare of the cow and her continuous Milk production.

This is what has made the Empire Milking Machine predominate. In less than two years, sales in Canada alone have trebled.

With the Empire Teat Cup, sore teats do not nor cannot result—between each two spurts of milk the teat is completely relaxed and massaged from tip to udder, precisely as when the calf milks, a fact which accounts for the usual increase in flow when Empire Milkers are installed.

With this practical Milker, many a 12-year-old boy or girl is replacing two hand milkers, at a saving per man of $600 a year. Before January 1st, Empire Milkers will have replaced over 100,000 hand milkers—a saving to dairymen of the United States of over $60,000,000 a year. What the figures will total at 1918 wages cannot even be conjectured.

With the Empire factory crowded to capacity, shrewd dairymen are getting their orders in for Empire Outfits while their dealers can take care of them. Do this without delay and write immediately for the Empire Profit and Prize Book and Catalog No. 56.

EMPIRE CREAM SEPARATOR COMPANY

Also Manufacturers of Empire Cream Separators, Gasoline Engines and Farm Electric Plants Bloomfield, New Jersey Chicago, Ill. Montreal, Can. Denver, Col. Toronto, Can.

THIS is the trade mark of Krause Dairy Feed—a feed that has made a high record as a milk producer for thousands of dairymen.

Krause Dairy Feed contains ten ingredients—each of which has distinct and specific values and they are so combined as to form a perfectly balanced ration.

This high grade feed will give your cows exactly what they need for big, rich milk production and keep them healthy and vigorous.

Feed "Krause" this winter and make more milk money. Write at once for free sample and useful record book. Give name of your dealer.

with increasing difficulty each month. Mr. Vincent fears a great decrease in dairy cattle will take place during this winter and a consequent falling off in available fluid milk. The increase in the price of milk to the consumer would be in proportion. Adequate prices must prevail if men are to be expected to continue dairying.

The association pledged themselves to observe the warning of Attorney Kearney not to utter rash statements or commit acts which would jeopardize their position. The following resolution was also passed and the governor has already announced his intention of including a statement with special reference to farm organization in his message to the legislature which is to convene in extra session at Madison in December or January:

Resolved, That the Hon. Emanuel Philipp, governor of the state of Wisconsin, be, and he hereby is, petitioned to include in the statement of the purposes for which the proposed extra session of the legislature of the state is to be called, that of considering certain amendments to the statutes of the state relative to trusts and monopolies.

Meetings are also to be held in other counties of the state which have locals belonging to the Chicago Milk Producers' Association for the purpose of acquainting the members with the reasons for the reduction of the price from $3.42 in October to $3.22 in November and December. Incidentally great stress will be laid upon warning the members not to sell dairy cows for beef, as a better day for the dairymen will dawn in the near future.

International Judges and Judging.

Chicago International Live Stock Exposition December 1 to 7 Will Be Larger Than Ever—Judging Begins Promptly on First Day.

THE entry list of the International Live Stock Exposition is one of the longest in the history of the show. In number of exhibitors it exceeds that of any previous list by 20 per cent. The total entries are also the highest ever. The number of breeding Short-horns entered is 527 and fat Short-horns 78; breeding Aberdeen Angus, 199 and fat Angus 69; breeding Herefords, 465 and fat Herefords, 28; breeding Galloways, 82 and fat Galloways, 8; breeding Red Polled, 111 and fat, 9; breeding Polled Durhams, 69 and fat, 6. In the regular classes of grades and cross breds 124 entries have been made and fifty-five entries from boys' clubs.

In the horse department 334 Percherons, 225 Belgians, 181 Clydesdales, 84 Shires and 20 Suffolks have been entered. In addition to this the draft horse and harness class contains 56 entries.

In the swine department there have been entered 122 breeding Duroc Jerseys and 47 fats; 100 breeding Berkshires and 69 fats; 98 breeding Chester Whites and 48 fats; 66 breeding Hampshires and 47 fats; 51 breeding Tamworths and 6 fats; 32 breeding Yorkshires and 20 fats. In addition 63 head of hogs have been entered in the grade and cross-bred classes.

Judging will begin promptly on Saturday, the first day, at 9 o'clock a. m.

Following is a list of the judges of the various breeds, grades and cross breds, carload lots, etc.:

CATTLE.

Short-horns (breeding and milking)—Robt. Miller, Stouffville, Ont.; (breeding and fat)—W. A. Dryden, Brooklyn, Ont.

Aberdeen Angus (breeding and fat)—Dr. H. M. Brown, Hillsboro, Ohio.

Herefords (breeding and fat)—Joseph F. Green, Gregory, Texas.

Red Polled (breeding and fat)—Elliott R. Davis, University of Nebraska, Lincoln, Neb.

Galloway (breeding and fat)—G. E. Clark, Topeka, Kan.

Polled Durhams (breeding and fat)—Earl E. Robbins, Horace, Ind.

Grade and cross-bred and champion steers—J. J. Cridlan, Maisemore Park, Gloucester, England.

Carload fat classes (two year olds)—J. A. Crane, Union Stockyards, Chicago, Ill.

Carload fat classes (yearlings)—Thos. Murray, Union Stockyard, Chicago, Ill.

Short-fed special—Thos. Murray and J. A. Crane.

Carload feeder classes—Charles Brown, Flora, Ill.

Carload cattle (championships)—Wm. Leavitt, Union Stockyards, Thos. Murray, J. A. Crane.

Steers entered for slaughter—John Gosling, Kansas City, Mo.

Carcass cattle—Samuel T. White, Chicago, Ill.

SHEEP.

Shropshires (breeding and fat)—W. F. Renk, Sun Prairie, Wis.; J. C. Duncan (alternate), Lewiston, N. Y.

Hampshires (breeding and fat)—W. C. Coffey, Urbana, Ill.

Southdown (breeding and fat)—J. C. Duncan.

Lincolns (breeding and fat)—John T. Lethridge, Glencoe, Ont.

Cotswolds (breeding and fat)—Frank Brown, Carlton, Ore.

Dorset Downs (breeding and fat)—W. C. Coffey and H. H. Cherry (alternate), Xenia, Ohio.

Oxfords (breeding and fat)—J. C. Williamson, Xenia, Ohio.

Cheviots (breeding and fat)—G. W. Parnell, Fayetteville, N. Y.

Leicesters (breeding and fat)—Abram Easton, Freemont, Ont.

Rambouillets (breeding and fat)—J. P. Van Houten, Shoemaker, N. M.; Frank R. Cook, Belle Fourche, S. D.; John E. Webb, Southport, Ind.

Grade and cross-bred and champion—David McKay, Ft. Wayne, Ind.

Carload sheep—H. Noel Gibson, Dundee, Ill.

Carcass sheep—H. A. Phillips, Union Stockyards, Chicago, Ill.

SWINE.

Berkshires (breeding)—L. E. Ortiz, Bernardsville, N. J. Breeding and fat—E. J. Barker, Thorntown, Ind.

Poland Chinas (breeding and fat)—M. P. Hancher, Rolfe, Iowa.

Duroc Jerseys (breeding and fat)—W. T. Harris, Morganfield, Ky.

Hampshires (breeding classes)—Chas. Marker, Auburn, Ill. Fat classes—Harry Booth, Union Stockyards, Chicago, Ill.

Chester Whites (breeding classes)—J. W. Brendel, Zionsville, Ind. Fat classes—Harry Booth, Union Stockyards, Chicago, Ill.

Yorkshires (breeding and fat)—D. A. Gaumnitz, South St. Paul, Minn.

Tamworths (breeding and fat)—T. G. Scheer, Bethany, Ill.

Grade, cross-bred and champions—W. L. Carlyle, Stillwater, Okla.

Carload swine—W. H. Overman, Union Stockyards, Chicago, Ill.

Carcass swine—W. H. Tomhave, Pennsylvania State College, State College, Pa.

HORSES.

Clydesdales—Andrew McFarlane, Palo, Iowa; George Hutton, Madison, Wis.; Wm. Grant, Regina, Sask.

Percherons—C. F. Curtiss, Dean Iowa State College, Ames, Iowa; Harry McNair, Union Stockyards, Chicago, Ill.; Robert Graham, Toronto, Ont.

Shires—William Bell, Wooster, Ohio; C. F. Curtiss; Alex Galbraith, Edmonton, Alta.

Belgians—Eli Springer, Saginaw, W. S., Mich.; Harry McNair; W. H. Pew, Ames, Iowa.

Suffolks—R. P. Stericker, 845 Sheridan Rd., Chicago.

Drafters—C. F. Curtiss, Harry McNair, Robt. Graham.

This Calf Pays Five Times Its Feed Cost

Raising calves on whole milk is out of date. It is throwing away good money—costs you from $30 to $40 to bring the animal to five months old. Sucrene Calf Meal saves you from $25 to $30 in feed cost—enables you to sell or use nearly all the cow's milk. The calf thrives better, grows faster, with less chance of setback or sickness. *Let us tell you why.*

Sucrene Calf Meal

The Most Perfect Calf Food Science Can Produce

It is unlike any other calf meal on the market. Contains ingredients not found in any other, but which the calf must have for health and growth.

Sucrene Calf Meal is the most perfect substitute for whole milk on the market because it contains soluble blood flour, a strong protein food and one of the most effective bowel correctives—prevents scours; bone meal, which builds up big, strong frames; soluble starch and malt flour, which supply the necessary sugar in the most digestible form—now generally prescribed by physicians for human babies in preference to milk sugar; dried skim milk, which contributes the rare and mysterious life-giving material known as "vitamine," absolutely necessary to the young animal's full development.

The foregoing ingredients, with corn feed meal, linseed meal and flour middlings, constitute a complete food for the young calf. Its quality never varies, as does that of cow's milk, therefore insuring the steady healthy growth of the calf.

Sucrene Calf Meal can be prepared in a few minutes. Full feeding directions in every sack.

Order a trial sack from your dealer. You will find it the best feed investment you ever made. If he does not handle Sucrene Calf Meal write us his name and we will see that you are supplied.

Write for our Free Book on Calf Raising. Contains reliable information on every phase of the subject. Will save you money and trouble.

Your Cows Need This Great Milk-Making Winter Feed

Yes, sir! They need International Special Dairy Feed—right now when Jack Frost has taken away all chance of pasture

INTERNATIONAL Special Dairy Feed

stimulates the appetite, keeps bowels open, and above all, *increases* the milk flow and *lowers* your feed bill. Hundreds of dairymen report a gain of two quarts of milk per day from each cow. Figure out what this would mean from your herd.

A ton of International will feed a cow six months and in that time *increase* the milk yield by a value of at least ten dollars. Yet it costs less than home grown feed.

Try a Ton Today

If you would keep your cows in prime condition during the "barn period"—if you would reduce your feed bill—if you would bring the milk production to its highest natural capacity, and keep it there—try a ton of International. Go to your local dealer today. If he does not sell it don't take a substitute. Write to us. *Be sure you get International.*

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Handling Poultry During the Winter Months

POULTRY raisers of Wisconsin are doing their part to increase the nation's supply of poultry. Nearly $15,000,000 worth of poultry products are produced annually in the state, and this could be greatly increased if the methods of feeding and caring for poultry carried out by our best breeders were imitated by beginners as well as by those who are succeeding only in a half-hearted way. In order to stimulate interest in the application of better methods all around, The Wisconsin Farmer at this time desires to institute a little contest. This paper will pay $5 to the writer of the best article on the subject, "Handling Poultry During Winter Months," and $2.50 for the second best letter on the same topic. In writing these letters simply outline somewhat in detail your own methods, and in so doing remember that you will greatly benefit other poultry raisers.

Poultry Comments and Suggestions.

To the Editor:—A few lines in behalf of farm poultry seems to be nearest my heart in these times of unrest and necessity of increased production.

Wonderful what poultry does on encouragement received at the hands of the average farmer. You can travel from farm to farm and the first thing you notice is buildings for stock. You find good barns, hog houses, etc., but where is the poultry house? Usually you can find them in machine sheds, straw piles, trees and everywhere for want of proper place to live during severe weather.

Some places have buildings well built, but they are everything but comfortable for hens. Poor ventilation, set behind other buildings or in an out-of-way place where sunshine does not reach it. A great many have cold cement floors, no litter or straw, although it is plentiful on the farm.

No dropping boards under roosts or proper nest boxes to lay in should they be inclined. Then comes one of the most serious mistakes, that is, overcrowding capacity of houses. This combined with the filthy condition is a great disease breeder and tends to unequal feeding chances. Consequently there is a loss in egg production. Another drawback is hatching from eggs taken from flock at large. This brings varied types and very unsatisfactory results in growing stocks. The real outcome is that poultry doesn't pay. Eggs are all colors, sizes and range along several grades on market, making the average price lower for producers. Boilers are seldom sold. Most people market only at the holiday seasons, overcrowding the markets and down go prices to the disadvantage of the poultry man and buyer.

I say first of all, have a little real enthusiasm for your poultry. A well-built, comfortable house built on some elevated point so as to be dry and out in open where a few south windows can get the sun and be opened for ventilation if weather permits. Some can be open all the time. I would use dirt floor, but haul in a few loads of gravel early in the fall so it can dry out thoroughy, then a foot of good clean straw every now and then. This structure does not need to be built like a refrigerator nor hothouse—the main thing is to be free from drafts and dry.

Now comes the start of your flock. Do not be too saving on your first investment. A good beginning is a great ways toward success. Get in correspondence with some of the best breeders of thoroughbred fowls, after you have decided on your favorite variety. Do not buy the cheapest—get the best you can afford. It takes but a pen or setting or two of eggs. This brings you up to the same standard of quality that breeders have attained by years of work. Study your breed and improve upon it as you would on your cows or horses. Generally you find market for the surplus males raised—first season to pay cost of original start. It is a pleasure for buyers to get a nice, uniform bunch of poultry on the market. Quality is great to promote better markets and prices.

A good way is to sell young cockerels when they reach broiler size (two to two and a half pounds). As a rule, they bring as much at this time of year as if you held and fed until maturity. The advantage is also in favor of hens and pullets. They get surplus pickings and room left by the marketed cockerels to make them early and better layers. In marketing hens do not hold until molt, as they are very thin and unfit for market during this time. Sell early any hens you do not wish to retain another season even though you get few eggs here and there. The difference in price is more than those few late eggs bring.

Feeding methods are many. The most necessary is to keep fowls busy during confining months. I use heavy grains for scratching feed so that they go well down in the straw and use the most of bulky feed in evenings so as not to make the fowls sluggish during the day. Do not overfeed. This is done as often as underfeeding. A uniform flock of one variety can be fed to much better advantage than when several varieties are kept together.

Many farmers say they have not time to spend on fowls. Let some of the boys and girls take hold of the poultry. Put the responsibility on someone. They will benefit by this and show you results.

Give your fowls an equal chance with other farm products and stock and you will see more dollars and cents on amount of investment than anything you have on the farm.

WE MUST BACK UP OUR BOYS

ROBERT M. LA FOLLETTE

THERE is, and of course can be, no real difference of opinion concerning the duty of the citizen to discharge to the last limit whatever obligation the war lays upon him.

Our young men are being taken by the hundreds of thousands for the purpose of waging this war on the Continent of Europe, possibly Asia or Africa, or anywhere else that they may be ordered. Nothing must be left undone for their protection. They must have the best army, ammunition, and equipment that money can buy. They must have the best training and the best officers which this great country can produce. The dependents and relatives they leave at home must be provided for, not meagerly, but generously so far as money can provide for them.

I have done some of the hardest work in my life during the last few weeks on the revenue bill to raise the largest possible amount of money from surplus incomes and war profits for this war and upon other measures to provide for the protection of the soldiers and their families. That I was not able to accomplish more along this line is a great disappointment to me. I did all that I could, and I shall continue to fight with all the power at my command until wealth is made to bear more of the burden of this war than has been laid upon it by the present Congress.—(From speech of Senator La Follette in United States Senate.)

Who is disloyal?

Do you know that the Metropolitan Press is lying about La Follette?

Do you know that La Follette has favored every bill to better the conditions of our soldiers and sailors since he has been in the Senate?

Do you know that he secured an appropriation of $2,000,000 for the benefit of soldiers and their dependents during the Mexican troubles?

Do you know he voted to increase the pay of our soldiers who fight in foreign lands in this war?

Do you know that he has favored every appropriation bill to maintain and support our army and navy in the present war?

Do you know that while opposed to the draft law in principle immediately upon its passage he advocated full obedience to the law?

Who is disloyal?

Do you know that La Follette fought the hardest fight of his life to make war profits bear a reasonable proportion of war taxes and to relieve the poor from the high cost of living.

Do you know that it was largely through his efforts that taxes on the poor man's breakfast table—on tea, coffee, cocoa, and sugar—was defeated?

Do you know the war profits of the steel corporation, of the leather trust, of the packing combine and the munition manufacturers?

Do you know why when the price of wheat was reduced by order of the Food Commissioner that flour and the baker's loaf remained as before and foodstuffs went up?

Do you know why war profiteers want to stifle free speech and the free press?

La Follette's Magazine for November will discuss all these topics truthfully and fairly. You want the truth. Then subscribe for La Follette's now.

The Weathercock's Meaning.

A weathercock that once was placed
A farmer's barn above,
Bore on it, by its owner's will,
The sentence, "God is love."

His neighbor, passing, questioned him,
He deemed the legend strange—
"Now, dost thou think that like a vane
God's love can lightly change?"

The farmer, smiling, shook his head.
"Nay, friend, 'tis meant to show
That 'God is love' whichever way
The wind may chance to blow."

Start a Community Library.

Look in your bookcase and see if you have the nucleus of a library. Perhaps you can find just four or five books which you consider good, but you have read those long ago. If there is no library in your community, those few books can start one. But perhaps you do not care to give the books away. That is not necessary, but just be willing to lend them.

Elect a literature secretary in some local club. Give him the list of books you will lend and when he has secured lists from all the members he can distribute printed or typewritten copies to everyone interested. When a neighbor wishes to borrow a book, he comes to you for it, but you send a record of it to the secretary. In this way the loss of books can be prevented.

If you are one who believes the high school children of today are not cultivating a taste for good literature, see what kind of books are in the library. If the school is small, it may be that only the classics which need study to be understood, are to be found in the library. Naturally the rest of the pupils' reading consists of the few best sellers circulated among themselves. In that case, send the teacher the list of books which the pupils may borrow from their neighbors.

If you feel that you and your neighbors should read some new books, here is a plan you can try. A certain club of twelve members decided to have a reading circle. Each member bought one book and read it. At the bi-weekly meetings these books were passed on until at the end of six months every member had read every book.

These plans may help you to help your neighbor and may prove a starting point for a library in your community.—[Mabel Hoddle.

Don't Neglect Children's Teeth.

The examination, dental treatment and daily care of the teeth are matters of the greatest importance for school children. All decayed teeth, whether temporary or permanent, should be filled or otherwise definitely treated. Malocclusion (ineffective meeting) of the teeth should be remedied and can be corrected in early childhood.

It has been recently demonstrated that (in addition to daily brushing) the (prophylactic) cleaning of the teeth of children every three to six months by the dentist or by a properly trained dental hygienist will prevent most of the decay of teeth which takes place.

It may be predicted with entire confidence that in the near future adequate dental care will be insured to all school children in the country as well as in the cities. No item in all the wonderful measures for the health care of the soldiers in the trenches of Europe is more significant than the treatment of the teeth provided by the automobile dentist offices used in France and other countries. Shall not our children in the country schools—future citizens, and, if necessity requires, defenders of our own republic—receive as good dental care as soldiers in war?

The establishment of effective habits of daily brushing and cleansing of the teeth is one of the most essential features in health teaching in the schools. Every child should have his own toothbrush, which is kept in a clean place and is used immediately after eating at least once, or, better, twice a day.

For cleaning the teeth, a good toothbrush with bristles that do not easily break or pull out, should be used. The teeth should be brushed, not only up and down and across, but also by rotary or circular motion from the gums of one jaw over the teeth to the gums of the other, and so round and round. In addition to the toothbrush, dental floss (waxed silk thread) should be used every day or two to remove the decaying food from between the teeth, where decay most often takes place. The best mouth wash is limewater, which may be used beneficially once a day to rinse the mouth.

To make limewater, place one-half cupful of finely powdered unslaked lime in a quart bottle. Allow to stand twenty-four hours and pour off the clear liquid into bottle to use for wash. This powder may be used for successive solutions until entirely dissolved. —[From Report of Committee on Health Problems in Education.

Women Dig Potatoes.

When the world war called the men of England and France from their duties and sent them into the trenches, the women of those countries proved their loyalty by stepping into the vacant places and filling them most efficiently. The women of America are doing likewise. In country and town, field and factory, women and girls are falling into line and are helping to carry on the activities that otherwise would suffer because of the army draft.

For instance, Upper Wisconsin has an unusually large crop of potatoes this year and so many young men have responded to the nation's call and are in the training camps that it was difficult to get help to harvest the crop. One of our readers, who visited this district not long ago, writes:

I have recently visited an eight-acre field of potatoes in Wisconsin where

THEY ARE DOING THE PART OF GOOD SOLDIERS.

women were doing their bit by digging potatoes and filling crates.

This field was wild land last spring. The stumps were pulled with a tractor and a tractor pulled the plow and the disk to get the land ready for the potatoes. And now they were getting 110 bushels of potatoes per acre and in order that the crop might be taken care of the women had offered their services and were doing good work digging and crating and storing in trenches that portion of the crop that could not be shipped at once.

Ten million women have signed the food pledge whereby they agree to put forth their best efforts in the conservation of food in their kitchens. That is going to be a big factor in winning the war. These women in the potato field are going still further. Rather than let this important crop go to waste for lack of help, they have gone to work with a will to save these thousands of bushels of potatoes. Moreover, they enjoy the work, as evi-

CRATING POTATOES FOR SHIPMENT.

denced by the accompanying reproductions of photographs. The example of these loyal, useful women should put to shame the slacker.

What Is Your Favorite Breakfast Dish?

To the Editor:—I have found a great many helpful things on the Home page and I am coming to its readers now for some special help. I would like to have some of the farm ladies tell us some of the good dishes they have for breakfast. Meat is so high and eggs are scarce just now, so that I find it a problem to have something good and nourishing and yet have a variety.

Following is a good supper dish: Two cupfuls beans, one-quarter pound of bacon, cut in small pieces, one teaspoonful soda. Boil together four hours. Then add one pint tomatoes, two large onions, one teaspoonful

SUGAR 4c a LB.

chili powder. Boil one-half hour. Salt to taste. Serve hot. C. B.

Vegetable Marmalades.

Vegetable marmalades or jams are made less expensively than fruit marmalades, because a less proportion of sugar is used and because the vegetable may be procured more cheaply. The extension department of the United States Department of Agriculture, coöperating with state agricultural colleges in the north and west, presents several suggested recipes for vegetable marmalades or jams, to be used the same as fruit products. The ingredients for some of these are shown below. In each case the mixture should be cooked slowly until it is thick and the ingredients are tender, and then packed in hot jars and sterilized.

Carrot Marmalade.—Two cups of ground carrot, one and one-half cups of sugar, two sliced lemons, and two teaspoons ground ginger root.

Carrot and Orange Marmalade.—Two cups of ground carrot, the juice of two lemons, the juice and grated rind of one orange, one cup sugar.

Carrot and Pineapple Marmalade.—One cup of ground carrot, one cup of shredded pineapple, one cup of sugar, one sliced lemon.

Pumpkin and Pineapple Marmalade.—One cup of pumpkin peeled and ground, one cup of shredded pineapple, two cups of sugar, one teaspoon of ginger; this to stand overnight in a granite pan or for several hours until the juice is extracted. Add the juice and rind of one lemon and cook as heretofore stated.

Ripe Tomato Marmalade.—Twelve medium-sized tomatoes peeled and thinly sliced, one and one-half lemons sliced, one and three-fourths cups of sugar; to be placed in stew kettle in layers, cooked in covered vessel until tender, and then to simmer until of right consistency.

Green Tomato Marmalade.—Two pounds of green tomatoes cut in cubes, two teaspoons of bruised ginger root in cheesecloth bag, two cups of sugar, two sliced lemons.

War-Time Recipes.

Duchess Soup.—One-half onion, two tablespoons fat, two tablespoons flour, three cups milk, three-fourths cup grated cheese, salt and pepper. Cook the onion in the fat until tender, but not brown. Add the flour, then the milk gradually. Cook until smooth, add seasoning to taste. When ready to serve, put one tablespoon of the grated cheese in each plate and pour over it the hot soup.

Rice Croquettes.—One and one-half cups cooked rice, one cup thick cream sauce, one-fourth teaspoon paprika, one teaspoon salt, one egg, one tablespoon milk, dried bread crumbs. Add cooked rice to cream sauce. Season and form into croquettes. Dip into beaten egg to which one tablespoon of milk has been added. Roll in crumbs and place in well-greased dripping pan. Brush croquettes with melted fat and brown in hot oven. Serve with cheese sauce. Barley flour may be used in making the cream sauce.

Oatmeal Cookies.—One-half cup butter, one-half cup sugar, one-half cup raisins (seeded and cut fine), one egg, two tablespoons sweet milk, one cupful raw oatmeal, one cup flour, one-half teaspoon baking powder, one-half teaspoon cinnamon. Add the raisins to the creamed butter and sugar, then add other ingredients. The dough should be quite thick. Drop from spoon on well-buttered tins. Bake about fifteen minutes.

Fig Layer Cake.—One-third cup fat, three-fourths cup sugar, two eggs, three teaspoons baking powder, one and one-fourth cups milk, two cups white corn flour. Soak corn flour in milk several hours. Cream fat and sugar, add well beaten eggs, then the soaked corn flour. Beat well, add baking powder, beat quickly and thoroughly and bake in two round tins in moderate oven. Before serving place fig filling between layers.

Fig Filling.—Cut figs into small pieces, add one-third cup sugar, one-third cup water, one teaspoon of lemon juice to one cup of chopped figs. Heat in double boiler or saucepan until soft and thick enough to spread. Place while hot on cake.

Barley Pudding.—Five cups milk, one-third cup barley meal, one-half cup molasses, one-half teaspoon salt, two tablespoons sugar, one teaspoon ginger. Scald the milk, pour this on the meal and cook in double boiler twenty minutes; add molasses, salt, sugar and ginger. Pour into buttered pudding dish and bake two hours in a slow oven. Serve either hot or cold with cream.

The true conquerors are often those whom the world calls the vanquished. —Max Muller.

THE YOUNG FOLKS.

Lives Near Army Camp.

Dear Young Folks:—I have never written before, but I have read your letters for a long time. I am a boy nine years old and in the fourth grade. I have two sisters. One is in high school. We live four miles from town.

My father has a Ford car. The longest trip we have made was 100 miles.

We live twenty-five miles from Fort Riley and Camp Funston. I wish all the young folks could see them.

I am going to raise a garden and cultivate corn next year. I have a collie dog named Bouncer. He can drive the cows and do other things.

I think the answer to Lulu Louise's riddle is a needle. She asked: What has an eye but no head? Can any of you guess my riddle? What is the oldest piece of furniture in the world?

Homer.

Answer to "Little Red Head's" Riddle.

Dear Young Folks:—I am eleven years old and am in the sixth grade at school. I go two miles to school. I have two brothers, one big brother and one just a little larger than I am. My oldest brother is in Oklahoma. There are just three of us children, one girl and two boys. We live seven miles from one town north of us and ten miles from another south of us. We live on an eighty-acre farm.

I like the riddles and I think I can answer "Little Red Head's" riddle. He asked: What goes around the house and only makes one track? I think the answer is a wheelbarrow. Here is my riddle. Three-sevenths of chicken, two-thirds of cat and one-half of goat.

Thelma.

Herded Cattle During Vacation.

Dear Young Folks:—May I join your circle? I have written once before and my letter was not printed, so I hope that I will see my letter in the paper this time. I can hardly wait for the paper to come. I always read the Young Folks' page when I go home from the mail.

I am a girl twelve years old and I live on a farm. We have forty head of cattle, ten horses and about 300 chickens. For pets I have a dog that I can hitch up, and a kitten.

I have about three-quarters of a mile to go to school. I am in the seventh grade. I like my teacher very much. I have one brother who has graduated from high school, and one sister who is in the eleventh grade. We didn't have school for two weeks on account of corn.

During vacation I had to herd cattle. I have a white horse and I ride him when I herd the cattle. His name is George.

Ella.

International Sunday School Lesson.

(By REV. P. B. FITZWATER, D. D., Teacher of English Bible in the Moody Bible Institute of Chicago.)

Lesson for November 25, 1917.

A Psalm of Thanksgiving.

LESSON TEXT—Psalms 103.

GOLDEN TEXT—Bless the Lord, O my soul, and forget not all his benefits. —Ps. 103:2.

This Psalm is man's response to the goodness and mercy of God. It expresses the joy and gratitude of a forgiven sinner as he worships before God. There is too much in this Psalm for one to attempt to set it forth, so we must be content to display some of its most prominent notes.

I. Man's Entire Being Should Sing God's Praise, v. 1. The true worshipper praises God with every faculty of his being; his intellect, emotion, desires, affections all unite in praising Jehovah. The entire being responds in a song of harmonious praise. Some Praise God with their voices but not with their hearts; some with their intellect but not with their affections; some with their emotions but not with their wills. That praise which involves the entire being alone is pleasing to God.

II. The Benefits Granted, vv. 2-6. The Psalmist exhorts man not to forget all God's benefits. This seems to be needed now as well as then, for most of us are better at remembering our troubles and adversities, our losses and our sorrows, than we are at remembering our mercies and blessings. It would be a good thing for some of us to keep a record of the good things of life and see that, after all, our blessings outweigh our burdens. We have more days of sunshine than of clouds, more joys than we have of sorrows, more hours when we are free from pain than we suffer with pain. If God were as forgetful of us as we are of Him, life would be hard indeed.

(1) Forgiveness of Sin, v. 3. In forgiveness we are freed from the curse of sin and its blight and burdens are removed. We are not only forgiven, but we are healed of sin's disease; not only freed from the burdens of sin but of its effects, so that we do not go after the things of this world. To be saved for heaven means that we are saved from the world.

(2) Redemption, v. 4. We have been saved by Christ giving Himself as a ransom for our souls.

(3) Satisfaction, v. 5. When God redeems, he so thoroughly renews the man that the good things which he gets from God satisfy him. His blessings are so real that he finds satisfaction in God. Men and women of the world are reaching out after fleeting things. They are ever grasping after something, but are never satisfied. Not so with the redeemed soul; he finds absolute satisfaction in the things which God gives him. Worldlings may be satiated, but God's redeemed alone are satisfied.

(4) Executing judgment in behalf of the oppressed, v. 6. He is always on the side of the oppressed. God under-

GOOD LIGHT FOR THE FARM

WHY longer be satisfied with dim smoky kerosene lamps when you can light your home brilliantly with American Portable Lamps at less expense. Ornamental, handy, safe as daylight and almost as cheap. 400 candle power light for less than ½ cent per hour. No smoke, smell or dirt.

AMERICAN DARK CHASER

THE ideal lantern. Wind and storm proof. Built substantially to stand the hard knocks. No glass chimney to break, no smoke, no dirt. Safe anywhere and in any position. Ask your dealer about American Portables and Lanterns. Attractive literature on request.

RENEW NOW

Now that EVERYONE is trying to conserve EVERYTHING, suppose we get together and conserve time and money—both for YOU and for us.

Note the date on your paper and if it reads "Nov. 17," your subscription expires in November, 1917, and you should send your renewal at once. Send $1.50 for THREE YEARS, or $1.00 for one year.

You save time and bother if you renew for three years and get the matter off your mind. And you save time and bother for us if you renew early, before the big rush of renewals comes, later on.

During the winter months tens of thousands of readers send in renewals. They come so fast that our regular force cannot handle them promptly. We must use "new help," and this causes many errors, giving trouble and annoyance to you and to us. Please bear this in mind, watch expiration date on your address tag, and renew several months before your subscription expires, if convenient. It will not cost you a cent more, and will be a great accommodation to us.

We are planning big things for our readers this season. We will try to give you better service than ever before. You will confer a favor if you renew promptly. Will you co-operate? Write today.

THE WISCONSIN FARMER
Dept. W-4, Madison, Wis.

takes for his own, and sooner or later He will mete out justice to all. There is a reckoning day for the world coming. Those who have done evil shall suffer loss; those who have done good shall be rewarded.

III. Attributes of God for Which He Should Be Praised, vv. 7-18. These attributes have been displayed in God's dealings with his chosen people.

(1) Merciful and gracious, v. 8. He is slow to anger and plenteous in mercy. An example of his mercy is seen in the father of the prodigal son running to meet his son and kissing him. A very little thought will make very evident how God withholds his anger and waits patiently for an opportunity to extend his mercy.

(2) He will not always "chide," vv. 8-12. When God forgives he forgives forever. Men say they forgive, but how often they "chide" and "keep anger." God has not dealt with us according to our sins, for, as the heavens are high above the earth, so great is his mercy toward them that they fear him. So really has God forgiven us that our transgressions are as far removed from us as the East is from the West, an incalculable distance.

(3) He is compassionate and tender, vv. 13-14. This reveals God's fatherly heart. He fully knows our weakness. He does not deal with us as though we were strong. He knows how weak and fallible we are through the fall. It is consoling to know that God considers our "frame!" He knows that we are "dust."

(4) His Mercy is everlasting, eternal, vv. 15-17. Man is at best transitory, but God is eternal The one who rests his hopes in God is eternally safe. This should encourage us to lean not upon man but upon God.

(5) God is gracious to those who are in covenant relationship, v. 18. If we would enjoy these blessings revealed in God's attributes we must be God's children. His mercies are restrictive, only bestowed upon his own children.

IV. A Call to All the Universe to Praise the Lord, vv. 19-22. Since God is such a wonderful Being, He should have universal praise. His kingdom is over all; his Lordship should have recognition.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Enclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date fall and winter 1917-1918 catalog, containing 550 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating thirty of the various simple stitches), all valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

1591—Ladies' night dress, perforated for sack length and short sleeve. The pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 4 yards of 27-inch material for the sack style and 7 yards for the gown style for a 36-inch size.

1974—Children's outdoor set, consisting of leggings and coat. The leggings extend to the waist line. The pattern is cut in 4 sizes: 2, 3, 4 and 5 years. It requires 3¼ yards of 44-inch material for a 4-year size.

2082—One-piece dress for misses and small women. The pattern is cut in 3 sizes: 16, 18 and 20 years. It requires 5¾ yards of 44-inch material for an 18-year size.

2121—A pretty dress for the school girl. The pattern is good for wash fabrics as well as for silk and cloth. It is cut in 3 sizes: 12, 14 and 16 years. Size 14 will require 5⅛ yards of 32-inch material.

2259—A natty suit for the growing boy. The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. Size 8 requires 3½ yards of 44-inch material.

2265—A pretty dress for mother's girl. The pattern is cut in 4 sizes: 2, 3, 4 and 5 years. Size 4 requires 2¾ yards of 36-inch material.

Waist 2266-Skirt 2267—A good business dress. The waist pattern is cut in 7 sizes: 34, 36, 38, 40, 42 44 and 46 inches bust measure. Size 36 requires 3⅛ yards of 36-inch material. The skirt pattern is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure, and will require 3⅛ yards of 44-inch material for a 24-inch size. Two separate patterns, 10 cents for each pattern.

2268—A practical apron model. The pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42, and extra large, 44 and 46 inches bust measure. Size medium will require 4¼ yards of 36-inch material.

2272—A smart frock for mother's girl. The pattern is cut in 4 sizes: 8, 10, 12 and 14 years. Size 10 requires 4⅛ yards of 36-inch material.

2275—A new dress and hat for Miss Dolly. The pattern for this attractive design is cut in 6 sizes: For dolls, 16, 18, 20, 22, 24 and 26 inches in length. Size 24 will require 1½ yards of 27-inch material for the dress, and ⅝ yard for the hat.

2281—A neat house dress. The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 6½ yards of 44-inch material.

2300—An attractive set of toy animals. The set includes a sheep, dog and pig. It will require ½ yard of flannel for the sheep, ¾ yard for the dog, and ⅜ yard for the pig.

Manitowoc County Association.

To the Editor:—The Manitowoc County Cow-Testing Association reports 425 out of 587 cows tested during the past month. John Pinter owns the highest producing cow, which yielded 52.4 pounds butter fat. Cheese factories paid from 64 to 68½ cents per pound of butter fat for September, plus a payment of from 5 to 13 cents per hundred of milk for whey fat. The condenseries paid 71 cents for butter fat during October and are now paying 75 cents or $3 per hundred of 4 per cent milk. Following is the 40-pound list of this association for the 30-day period ending November 10th:

J. E. BOWSTEAD, Cow Tester.

Small Tractor Pulling Manure Spreader.

This is M. W. Roberts, of Fulton, N. Y., sitting on his 5-10 horse-power Avery tractor, which he purchased last spring. Mr. Roberts operates nine acres of truck land and grows celery, onions and lettuce. He used the tractor in plowing and fitting the ground for his crops and claims that he did the work more cheaply than could be done with horses. It required from eight to nine gallons of kerosene a day. He is now using his tractor to haul crops in loading cars. He is quite delighted with his investment because he has no horses to feed. His soil is muck land, but he uses extra rims and claims that he can get on the land just as quickly as with teams.

New KEROSENE Light

10 Days Free—Send No Money | Beats Electric or Gasoline

We don't ask you to pay us a cent until you have used this wonderful modern white light in your own home 10 days, then you may return it at our expense if not perfectly satisfied. Our trial delivery plan makes it easy. No previous experience necessary. Practically every farm home and small town home will buy after trying. One farmer who had never sold anything in his life before writes: "I sold 51 the first seven days." Christensen, Wis., says: "Have never seen an article that sells so easily." Norring, Ia., says: "92% of homes visited bought." Phillips, O., says: "Every customer becomes a friend and booster." Kemerling, Minn., says: "No flowery talk necessary. Sells itself." Thousands who are coining money endorse the ALADDIN just as strongly. NO MONEY REQUIRED. We furnish stock to get started. Sample sent prepaid for 10 days' free trial and given absolutely without cost when you become a distributor. Ask for our distributor's plan. State occupation, age, whether you have rig or auto; whether you can work spare time or steady; when can start; townships most convenient for you to work in.

What 15c Will Bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve-center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 25th year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what's going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us; we are glad to invest in new friends.

In and Around Wisconsin

One hundred fifty carloads of both young and matured dairy cattle, including grades and pure breds, have been shipped to western buyers during the past year. This work has been conducted largely by county agricultural representatives, working through the headquarters office of the State Agricultural Extension Service and the Wisconsin Live Stock Breeders' Association. Consignments have been chiefly to points in Oklahoma, Kansas, Iowa, North Dakota, Minnesota, Oregon, Illinois, Texas, Colorado, Montana and Tennessee. Some of the men who have been identified with the transfer of this desirable Wisconsin dairy stock are L. M. Allen, passenger traffic manager of the Rock Island, who distributed pamphlets telling of the Badger breeding stock; E. F. Burton, dairy agent of Wyoming; E. G. Bennett, commissioner of dairying, Missouri; A. Castigliano, Italian consul, Minnesota, who bought stock for an Italian colony from Barron county breeders; L. A. Farrell and R. C. Shiflett, banker and county agent, respectively, Oklahoma; Bartlett Eastman, North Dakota; C. A. Hutton, Tennessee; Agricultural Extension Department, State University; C. M. Long, Pettis county farm bureau, Missouri; C. H. Eckles, College of Agriculture, University of Missouri; W. A. Posey, county agent, Iowa. The coöperation which has been possible along these lines has placed Wisconsin in a position where she has been able to contribute to the producing power of other less-favored regions. It has also saved fair to good dairy cows from the chances of slaughter as beef. It has relieved the dairy calf situation somewhat in cheese factory and condensery sections where farmers find it hard to raise calves at a profit. It has given the Wisconsin farmer a better price for good surplus stock. It has induced communities here and elsewhere to get together and standardize on some particular breed of dairy cattle.

This Winnebago County Cow Produced Last Year $100 Over Feed Cost and Was Sold on This Meritorious Record to a Tennessee Farmer.

Members of the Wolf River Coöperative Cow-Testing Association met recently at Algoma, Kewaunee county. It was decided by members of the association that in figuring the cost, silage should be placed at $4.00 per ton, which remained the same as was established by the organization last spring. The value of pasturage was also left as it was established last year, that is, $1.00 per month for wild pasture land and $2.00 per month for cultivated pasture land. The members of the association decided to make use of concentrated feeds, which will be purchased in carload lots through local dealers. The Cow-Testing Association has a committee which will keep in close touch with the members relative to their supply of feeds and when the supply runs low, new orders will be placed. It is the belief of dairymen in this section that it will pay to feed a certain portion of mill feeds notwithstanding the high prices.

A movement to promote more wool in the state has extended to Dane county and a number of merchants recently met in Madison and perfected an organization to encourage the farmer boys of the county to form sheep clubs.

Mr. R. A. Kolb, county agent for Taylor county, has advised farmers to make the best of the unfortunate situation as regards seed corn. His advice is to look around early. Even in the better counties of the state there is some seed corn taken from sandy sections. Mr. Kolb says, "Do not delay until it is too late in looking about for seed corn, but take the matter up at once, as those who wait till spring may find good acclimated seed corn almost impossible to get."

There is prospect for quite lively competition in the buying of milk in Kewaunee county due to the fact that the Van Camp Company are remodeling their old factory, formerly used for canning peas, and turning it into a condensery. This condensery will be a competitor for local cheese factories for the milk supply and according to reports farmers are somewhat undecided as yet as to whether it will pay them best to continue sending their milk to cheese factories or to become patrons of the condensery. It is argued that the condensery does not give full returns of the milk with a test of 4 per cent or better and there is considerable milk in Kewaunee county which comes up to this test. Another factor which enters into the situation is that in hauling to factories the farmers are given their whey, which is used for feeding hogs and which is generally considered to be worth 20 cents per hundred pounds. Most of those who figure the value of whey consider it worth more than that. Those who take their milk to the condensery have no returns in the way of by-product. One suggestion which has been made is that the farmer having cows with low butterfat percentages could possibly best afford to deliver to the condensery, while the high-test milk would bring better returns at the cheese factory. However, the problem of dividing the product in any particular form is rather an unsatisfactory one.

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

BEANS WANTED.

BEANS WANTED—Send samples, machine run or hand-picked navies, naming lowest price and quantity. C. O. Bashaw Co., Plymouth Bldg., Minneapolis.

SHEEP.

LINCOLN, Hampshire, Rambouillet, Shropshire, rams. Brogden Farm, Rush Lake, Wis.

FREE TUITION

IN REGULAR COURSES to first student from a postoffice. Study any of the following: Common School, High School, Music, Commercial, Teachers, Steam and Gas Engineering, Auto Mechanics, Correspondence courses also. Write for catalog and tell what course you want.
UNIVERSITY OF SOUTHERN MINNESOTA, Dept. F. T. Austin, Minn.

FARM LANDS.

A SMALL CALIFORNIA FARM earns more money with less work. Raise crops you know: alfalfa, wheat, barley; also oranges, grapes, olives, figs. Ideal for dairying, pigs, chickens. Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

Anoka Farms' Short-horn Sale.

THE 33 females in the Short-horn offering at Anoka Farms, Waukesha, Wis., Saturday of next week, December 1st, represents the last word in Short-horn breeding merit. Never before has so strong an array of heifers been put forward by this great breeding establishment and the writer doubts very much if an equal number of corresponding worth could be found in any herd in the country. In the list is Augusta Anoka, an outstanding proposition by Crystal Stamp, first at Minnesota and Wisconsin and second at Des Moines. She is a top proposition and has for a dam an imported cow that is a full sister to the bull that recently sold in the Argentine for $23,500. Fanny Anoka by Crystal Stamp was junior champion at Milwaukee, second at Hamline and third at Des Moines. Beauty Anoka 2d by Crystal Stamp, leaves nothing to be desired in individual excellent and her breeding is the best. Columbia Anoka by Anoka Stamp, is a good one in any company, as is Athene Anoka by a son of Village Denmark. Several outstanding daughters of Imp. Rusper Champion are in the list, among them Beatrice Anoka 3d, Missie Sultan 3d, out of a dam by Whitehall Sultan and Clipper Anoka 7th. And so it goes all through the list. Character, substance, quality, all backed up by the best of blood lines, make this lot of cattle one of extraordinary merit, viewed from any angle. They are a decided credit to the Short-horn breed as a whole and will give added prestige to the reputation of Anoka, as one of the great Short-horn breeding establishments of the world. Catalogs for this great sale, together with a handsome photogravure of every animal in the offering, can be secured by addressing Anoka Farms, Waukesha, Wis. Kindly mention this paper when you write. See advertisement on page 21.—Adv.

Peterson With Krause Milling Co.

THE Chas. A. Krause Milling Company, of Milwaukee, manufacturers of mixed feed, has secured the services of P. O. Peterson to represent them in the state. Mr. Peterson has had valuable experience in the dairy world. He is a graduate of the University of Wisconsin in the college of agriculture class of 1907, having specialized in animal husbandry. For a year after finishing his course he was a herdsman at the experiment station dairy farm. For one year he had charge of the advanced registry tests at the Hartwood Farm, Barrington, Ill., and for the past three years, he has been superintendent of the Edgewood Farm at Burlington. Mr. Peterson is one of the best posted young men along dairy lines in the state and is a member of the state Holstein Breeders' Association and also the milk producers' association. He should make an admirable representative for the Krause Milling Company, which is paying special attention to the manufacture of high-grade feeds for dairy cows.—Adv.

Jefferson County Guernsey Breeders' Association.

MR. H. A. MAIN, secretary of the above-named association, who is located at Fort Atkinson, Wis., writes us that this association is in a position to furnish buyers with high-class grade Guernseys of all ages as well as a number of pure-bred females and pure-bred bulls from exceptionally well-bred dams. No commission or livery expense is charged and inspection is requested. Over 100 herds of Guernseys are located in this vicinity and buyers for pure breds or high-class grades will do well to get in touch with Mr. Main, as he is in a position to know exactly what the association has to offer. See page 20.—Adv.

Boars by Taxpayer Orion.

ALLIC S. KNUDSON, Brodhead, Wis., is making special prices on his Duroc boars sired by Taxpayer Orion. These boars are of April farrow and the dams of most of them are by Valley G., a litter mate to the well-known Illustrator. Mr. Knudson will ship you a good, well-bred boar worth the money, and he advises us that he has shipped boars for 10 years and only had one returned, and that certainly speaks for his integrity. Get in touch with this breeder if you want a boar of this breed. Please mention The Wisconsin Farmer. See page 23.—Adv.

A Few Good Durocs.

L. F. ATWATER, Bangor, Wis., has a few Duroc boars on hand that he thought too good to "knife," and if you have not purchased your stock hog yet write L. F. and he will send you a boar that will fill the bill. They are of the same breeding as the boars that sold in the October sale for $85 average. They were farrowed a little later, though they are big for their age. Buy from the fountain herd.—Adv.

Kirst Has the Goods.

A WISCONSIN FARMER representative was in Tomah, Wis., a short time ago, and called on the various Kirsts around there, among them being Alfred E., the Duroc breeder. He has five boars that are "real ones." They will weigh 250 pounds or more and are absolutely right in every respect. The man that gets one of these boars will certainly be pleased. If wanting one, write quick, for there are only five for sale. See page 23.—Adv.

Keep Your Eye on J. F. O'Brien.

J. F. O'BRIEN, Madison, Wis., is getting together a good herd of big-type Poland Chinas, and is sparing no money when it comes to buying foundation stock. A Wisconsin Farmer representative recently spent the day on his farm a few miles from Madison. He owns a sow that would be a credit to any herd, namely, Great Prospect. This sow was first-prize junior yearling at the Minnesota State Fair this fall, is an April yearling, and weighs right at 700 pounds. We are safe in saying that she is the best yearling of the breed in the state. Mr. O'Brien also sent to the Mouw sale and bought Mouw's Black Maid 2d, and bred to Gerstdale Jones. Besides the above one of the good young sows is sired by Crow's Progress out of that grand old brood sow, Big Type Bess. At the head of the herd is Big Ben 2d, a yearling son of the well-known breeding boar, Big Ben. Assisting this fellow is a son of Blue Valley Timm Jr., out of a Columbus-bred dam. With this line-up, Mr. O'Brien certainly is started right in the Poland China business. He expects to buy a few more good ones bred to good boars of the best big-type backing. Keep your eye on Mr. O'Brien. He is headed in the right direction. See page 23.—Adv.

Ceylon Court Jerseys.

THE most prominent blood lines of this register of merit herd are Noble Oaklands, Golden Jolly, Eminent, Royal Majesty and Dairy's Golden Jolly. Mr. D. G. Gilbert, superintendent of this well-known herd in southern Wisconsin, will be glad to furnish anyone interested with a price list of the young stock that they are offering for sale. They will be still better pleased to show this herd and the ancestors of the animals they are now offering for sale. See page 21.—Adv.

Special Train to Anoka Short-horn Sale

A special train will leave Chicago Saturday morning, December 1st, at 8:40 o'clock, over the Chicago & Northwestern, for Waukesha, Wis., where it will arrive at 11 o'clock. It will return to Chicago after the Anoka sale, leaving Waukesha at 5 p. m., arriving at Chicago at 7:30. The time of departure is set so that connections can be made from all trains arriving in Chicago in the morning.

Matthes Boars Will Suit.

FRED G. MATTHES, Viola, Wis., writes that he has made several Duroc Jersey boar sales and that the men to whom he shipped have been more than pleased. He has seven boars for sale that are good enough to ship on approval. Two are by Pathfinder 2d, and they weigh 179 and 180 pounds. Two are by King the Col. Again that weigh 175 each. Three good boars by a son of Cherry Chief's Wonder, 200, 225 and 235 pounds respectively. These boars are being priced worth the money and if you will write Mr. Matthes for details he will give you an exact description of them. See page 23.—Adv .

Clara I. Barker's JeJrseys.

MISS CLARA I. BARKER, proprietor of Camp Barker Farm Jersey herd, is offering for sale a few choice young bulls that are particularly fine individuals and bred from register of merit stock. They are of the Noble of Oakland, Pogis 99th of Good Farm, Gamboge's Knight and Golden Fern's Lad breeding. These young bulls are priced to sell quickly and Miss Barker will be glad to furnish pictures and detailed descriptions of the animals mentioned.—Adv.

Boars for Sale.

HAUK BROS., Cassville, Wis., can sell you a boar—Poland China—if you want one. They have them that are large individuals and are bred right. Write them your wants. See page 23.—Adv.

Sheep and Goats.

MR. GEO. A. PHILIPPI, Bear Creek, Wis., is offering a limited number of choice pure-bred and registered Oxford, Hampshire, Cheviot, Southdown, Delaine, Cotswold and Rambouillet sheep in both ewes and rams for sale; also high-class registered Angora goats of both sexes from the leading show and breeding flocks in the central states.—Adv.

Coats' Chester Whites.

MR. O. P. COATS, Elkhorn, Wis., whose Chester White herd is well known throughout the state, is now offering for sale two two-year-old boars and one yearling boar that are good enough to head any herd; also a number of spring boars that will weigh better than 200 pounds. Mr. Coats also has a few fine spring gilts and 30 choice September pigs for sale. The September pigs he is offering at $15 each to be shipped when three months old. Mr. Coats is making it easy for farmers to get started in Chester Whites with a small initial outlay of capital. We trust persons interested will kindly mention The Wisconsin Farmer when writing Mr. Coats regarding his herd. See page 22.—Adv.

Fred Gurr, Lake Mills, Wisconsin.

MR. GURR is offering for sale a young Holstein bull sired by a son of King Segis Pontiac Polkadot, a full brother in breeding to the $50,000 King Segis Pontiac Alcartra. The dam of the calf Mr. Gurr is offering for sale has a record of 18 pounds at three years and has an 18-pound 26-month-old daughter. Mr. Gurr is known to have animals of good individuality and we can, therefore, recommend his offering to our readers. See page 22.—Adv.

Edge Has Good Durocs.

DON'T forget Wm. Edge, Fennimore, Wis., that genial Duroc breeder of Grant county. If you want Durocs, write Edge, he has them and has them good and if he ships you a boar or a gilt you can rest assured they will be right. See page 23.—Adv.

Hartley Stock Farm.

W. T. HARTLEY, owner of Hartley Stock Farm, and breeder of Short-horn cattle and Poland China hogs, is located near La Crosse, Wis. His advertisement starts with this issue, offering for sale 20 Short-horn cows and heifers and 30 bulls. A representative of The Wisconsin Farmer recently saw this stock and says that anyone wanting a good bull or some good females can find them in this herd, and they can be bought worth the money. The colors are good, and they are in excellent condition. In Poland Chinas Mr. Hartley is offering 50 head of boars and gilts. Write him your wants. See advertisement on page 21.—Adv.

Warmington's 701.8-Pound Two-Year-Old Jersey Bull.

P. G. WARMINGTON, Honey Creek, Wis., is offering for sale a handsome young bull, whose dam is in the register of merit class AA, having produced 701.8 pounds of butter as a junior four year old. Her dam made 447 pounds at 13 years and the sire of this two-year-old bull is a grandson of Boutillier, the highest record cow on the Island. Anyone looking for a high-class Jersey bull combining individuality and register of merit performance to a high degree will do well to write Mr. Warmington for further particulars regarding this animal. See page 21.—Adv.

Kirst Has Some Great Gilts.

WE recently saw the A. L. Kirst Chesters at Tomah, and we are glad to say that he has some of the best gilts we have seen. They will average around 200 pounds, and have the desired stretch with good backs and feet. The boars have all been shipped out, and have given good satisfaction so far. The gilts are being bred to a 300-pound spring pig of Chief Keokuk breeding, and are for sale for immediate shipment. See page 22.—Adv.

Knight's Recent $700 Kentucky Purchase.

MR. WM. M. KNIGHT, Eagle, Wis., recently attended W. R. Spann's fifteenth semi-annual sale of Island bred and imported Jerseys at Shelbyville, Ky., and purchased a cow that is estimated by well-informed Jersey breeders to be the best daughter of the great Oxford Majesty. This cow was one of the richest bred animals of the sale and has Oxford Lad breeding on both sides of her pedigree. She now has a register of merit test of 529.2 pounds butter and 8,253 pounds milk. In addition to this royal breeding and splendid register of merit performance, she is a cow of outstanding individuality, being a large cow with good lines and possessing an exceptionally good udder and teats. Besides all these points of interest she is safely in calf to Mabel's Raleigh's Prince. We prophecy a great future for Mr. Knight in the Jersey business as he is one of the most enthusiastic men of the state, anxious to breed animals that excel in individuality and register of merit performance. It will be remembered that last fall it was Mr. Knight's herd that was most prominent at the leading county fairs and that took a big share of the blues at the Wisconsin state fairs. One of the most outstanding animals of his show herd this fall was Eminent's Safety Bell 2d, that was first in seven county fairs and also first at the state fair. She is a particularly handsome heifer and would have given a very good account of herself at the National Dairy Show. See page 21.—Adv.

Cole Has a Great Lot of Gilts.

ON the 12th a representative of The Wisconsin Farmer called on A. W. Cole, at Lodi, Wis., and reports that he saw 20 of the nicest and most uniform lot of Poland China gilts that he has seen this fall. We feel safe in saying that the 20 head would have averaged 225 pounds on the above date, and every one with a good foot, bone and back. They were great, and Mr. Cole prefers to sell them open, rather than hold them over and breed them. However, if they are not sold within the next week or so they will all be bred. If interested in open gilts, write Mr. Cole, for these gilts will please anyone. See page 23.—Adv.

Quackenbush, of Melrose.

IF you could see the herd of Poland China sows owned by W. W. Quackenbush, Melrose, Wis., you would want a boar or a gilt out of some of them. Quackenbush has the goods and if you should order a boar and some gilts of him, you can rest assured that you would get a good pig. He sent his "tail-enders" to Chicago and he sure has a nice lot of gilts. If you have not purchased that boar, we gladly refer you to this breeder. He will treat you right and you will get your money's worth. Write him. See page 23.—Adv.

Write Derenthal.

WE have just been advised by H. A. Derenthal, Wykoff, Minn., that he has no more March Chester White boars for sale, but his April and May pigs are doing fine and ready to ship out at a price in keeping with their age. These are well grown and are of the very best Chester White blood lines. These late pigs may suit you and if interested it will do no harm to write for further details. See page 22.—Adv.

Reese, of Brooklyn.

LOUIE REESE, Brooklyn, Wis., has had a good demand for Poland China boars and gilts. There is generally a reason, when a man is able to sell when others can't. He either sells cheap or else has very choice stock. We don't know what price Reese gets for his Polands, but he did have a nice lot when we were there a short time ago. He will sell you a boar or a gilt—get busy.—Adv.

McKerrow's Shropshires and Oxfords.

FARMERS interested in Shrops and Oxfords should not forget the fact that George McKerrow & Sons' Co., Pewaukee, Wis., have 100 yearlings and lambs at reasonable prices. McKerrows have been breeding sheep for 30 years and have established correct type as has been demonstrated many times at the leading shows where their herds have been on exhibition. See page 23.—Adv.

Special.

ALLIC S. KNUDSON, Brodhead, Wis., is offering for sale some Guernsey bulls that should appeal to the critical buyer. If you appreciate breeding and individuality, you cannot help but be pleased with the youngsters offered by Mr. Knudson. Get in touch with him at once if in need of a Guernsey bull. Mention The Wisconsin Farmer.—Adv.

Orion King.

DON'T forget Orion King, that good son of the champion King Orion, and owned by Mike Stoehr, Viroqua, Wis. Mr. Stoehr is breeding a fine lot of big, stretchy gilts to this boar

Field Men for The Wisconsin Farmer.

J. R. Garver, eastern half of Wisconsin. Address Room 201, Washington Bldg., Madison, Wis.

T. P. Shreve, western half Wisconsin and eastern Minnesota. Address 115 S. Main St., Janesville, Wis.

W. S. Steele, northwest Iowa, South Dakota, western Minnesota. Address Box 109, Sioux City, Iowa.

Fred V. Johnson, Wisconsin, Illinois, Indiana, Ohio, Michigan and Kentucky. Address 924 Hearst Bldg., Chicago, Ill.

Carlos C. Palmer, eastern half of Iowa and Minnesota and swine division in Illinois. Address 2714 High St., Des Moines, Iowa.

A. T. Cole, Missouri. Address 3900 Holmes St., Kansas City, Mo.

M. T. White, western Iowa and northeastern Nebraska. Address 4015 Izard St., Omaha, Neb.

and they will be for sale as soon as they are safely settled. If you are going to want a bred sow carrying a litter by one of the best young Duroc boars in the state, write Stoehr. See page 23.—Adv.

Important.

MEN interested in Poland Chinas should write W. W. Quackenbush, Melrose, Wis., and let him tell you about the boars and gilts that he has for sale. The boars are fine in every respect and will please the prospective buyer. The gilts are great and the man that wants a few gilts for a winter sale can find them at Quackenbush's that will be a credit to any sale offering. They can be bought so that they will sure make money unless they die. It is useless to talk about the breeding, for those that follow the game know that he bought some of the best sows sold in Minnesota and Wisconsin last winter. We recommend this big-type Poland herd. See page 23.—Adv.

Guernseys and Durocs.

ALLIC S. KNUDSON, Brodhead, Wis., has a wonderful herd of Guernsey cattle. Some good A. R. records have been made from this herd and if you want a bull with A. R. backing, Mr. Knudson has some that will suit you. He also has a nice herd of Durocs and just at this time has a nice lot of spring boars and gilts to sell. You cannot help but be pleased with the class of stock this breeder raises. Write him for details and please mention this publication. See this page and page 23.—Adv.

Buy a Shea Boar.

DENNIS SHEA, Melvina, Wis., has as good a lot of spring pigs as we have seen. He had a large number of boars and has sold many to old customers, but he still has 15 or 20 that are good enough to ship on mail orders and give satisfaction; in fact Dennis will ship on approval if you wish. No one can be fairer. The breeding is the best and the boars are good. What more do you want? See page 23.—Adv.

Bates Cattle.

DON'T forget that B. W. Little, of Janesville, Wis., has a herd of Short-horns that for Bates breeding is second to none in the state. If you want cattle that trace to the fountain herd, communicate with B. W. Little. He has some very nice young bulls for sale, around a year old, of the very best breeding. Let him describe them to you. See page 21.—Adv.

Milking Short-horns.

LET Marquart Bros., Milton Junction, Wis., quote prices and describe the milking records back of the young bulls they are offering for sale. They have a grand herd of cattle. See page 21.—Adv.

Scotch Short-horn Bulls.

IF you are in the market for a Scotch bull of the very choicest breeding visit the Kennedy herd. Mr. Kennedy has them as good as can be found in the Northwest, and if you would like to spend the day looking at the best herd of Short-horn cows in the state visit J. E. Kennedy, Janesville, Wis. See page 21.—Adv.

Chief Defender.

R. C. CHURCH, Elkhorn, Wis., and the owner of that big yearling, Chief Defender, advises us that he is sold out of Duroc boars, having had a good call for the boars sired by "Chief." He is breeding his gilts to this good boar, and they are being sold now. If you want the big kind, here is the place. See page 23.—Adv.

Good Polands.

WM. HAUK, Cassville, Wis., had some of the nicest Poland Chinas we saw when we made a trip over Grant county a short time ago. He has boars and gilts for sale, and will try hard to please those interested in this breed. Write him and please mention The Wisconsin Farmer. See page 23.—Adv.

Write O'Keefe.

IF you'll write M. H. O'Keefe & Son, Waunakee, Wis., they will be pleased to describe the Duroc Jersey boars and gilts that they have for sale. They have a nice lot, and The Wisconsin Farmer does not hesitate a minute to recommend Mr. O'Keefe to prospective buyers. See page 23.—Adv.

Ackerman Has Poland Chinas for Sale.

WM. F. ACKERMAN, Glen Haven, Wis., will sell boars or gilts, and if you want a boar or a few gilts write him. They are sired by A. Big Orange, the boar that sired so many good pigs while in this herd. Ackerman can send you a good spring pig worth the money. See page 23.—Adv.

Jerseys—Stubley.

IF you are in need of anything in the line of Jersey cattle, write Fred Stubley, Black Earth, Wis. Mr. Stubley has one of the largest Jersey herds in the state, and if you want a few females or a good bull with A. R. backing, write him for further information. See page 21.—Adv.

George Offers Choice Boars.

WALTER GEORGE has some Chester White boars on hand that should be working for someone. If you want the big kind, not fat big, but naturally big, George has that kind, the good-footed, high-backed, strechy kind. Write George at Evansville, Wis. See page 22.—Adv.

Poland China Boars.

WM. SMILEY & SONS, Albany, Wis., advise us that they still have a few good Poland China boars that they will ship out. Many of their old customers can use these boars and the old customers are Smiley's best customers. They guarantee every boar. See page 23.—Adv.

April 4-5, Inter-County Holstein Sale, Watertown, Wis.

Fred Wright's Holstein Sale.

Having disposed of his farm near Milton Junction, Wis., Mr. Fred Wright held a sale Wednesday, November 7th. The cattle were right off pasture. The yearling heifers, while very promising, were thin. The calves were in nice sale shape, showing good care and feed. While the prices of the cows were not high, it will be noticed by comparing them with the prices of the grades, of which there were eight, three with calves at foot, that the selling price of the pure breds was twice that of the grades. As there was no other expense except for foundation stock and $1 per animal registration fee on the cost difference of the pure bred over the grades, this sale is certainly a strong argument for pure-bred stock. The individual sales and averages were as follows:

Mutual Inka of Rock, Jas. Sprackling, Janesville $250
Heifer calf, Jas. Sprackling 185
Plebe Crissie, Allen B. Godfrey, Milton 165
Heifer, Ralph H. Harvey, Evansville 110
Mutual Korndyke of Rock, F. W. Walmer, Whitewater 155
Heifer, Geo. A. Fox, Sycamore, Ill. 85
Mutual Caroline of Rock, Frank Fisher, Janesville 175
Heifer, Geo. Fox 145
Juliana Ykema of Rock, John Wehinger, Janesville 95
Mooie Aaggie of Rock, L. Silver, Milton 225
Colantha Sadie Tietje 2d, James Sprackling 240
Heifer, Jas. Sprackling 130
Juliana Bess of Rock, Jas. Sprackling 250
Bull, James Sprackling 70
Cornucopia Roella Hengerveld, L. Silver 190
Bull, F. W. Walmer 25
Inka De Kol Princess 2d, Alf Austin, Milton Junction 165
Bull, Herman Schmeling, Milton 75
Mutual Pontiac Fobes, Jas. Sprackling 220
Heifer, James Sprackling 100
Mutual Pauline of Rock, F. W. Walmer 170

Make Your Live-Stock "Make Good"

The need for beef, pork, mutton, milk, butter, cheese, hides and wool was never as great, and prices never as high. This is your big opportunity, so "speed up" your stock. Help meet this unusual demand and make bigger profits than ever before.

Pratts Animal Regulator

added to the ration daily makes horses, cattle, sheep and swine more productive and profitable. Makes your live-stock "make good"—or your money back.

Pratts Animal Regulator increases strength, growth and production in a *natural* way by *keeping the stock in perfect health.* It tones up the whole system—sharpens appetite—improves digestion—expels irritating worms—regulates the bowels—makes all organs do their work well and efficiently. That means more work from horses and mules—more milk from dairy animals—more flesh in shorter time—*less expense* and *bigger profits.* Prove it at our risk under this guarantee:—

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—"*Your money back if YOU are not satisfied*"—the guarantee that has stood for nearly 50 years.

W. L. BREITRICK GREENVILLE, WIS.

ANOKA FARMS

SHORT-HORNS

SATURDAY, DECEMBER 1

NO mention of the Short-horn breeding industry in this country could in any sense be called complete without according high rank to Anoka Farms, Waukesha, Wis. The productions of this great establishment have left their impress upon the Short-horn cattle of this country for all time. Even greater achievements in the future is the aim at Anoka, and each year's offering to the public adds new luster to the record of the herd. The sixteenth annual sale will be held at the farm Saturday, December 1st, and for this event there will be presented what is by far the strongest lot of cattle ever produced there. Breeding, quality and individual excellence are to be found to the utmost degree. Thirty-three females are in the list, daughters of sires of so much note as Regal Stamp, Imp. Rusper Champion, Crystal Stamp, Young Denmark by Village Denmark, Collynie Mine, and they leave nothing to be desired. Ten of the older heifers in the list will have been served by sale day by either Lavender Sultan or Masterpiece, a fact that gives them much added value. Included in this sale is the entire Anoka show herd, winner at Des Moines, Hamline and Milwaukee, and entered for the International, where the animals will be shipped and exhibited if the buyers so desire. The bull offering is an outstanding one in every particular, and youngsters are listed that are bound to become sires of sensational note. No individual study can be made of this lot of Short-horns. Representatives of the best families known to the breed are listed in abundance, and each one bears the Anoka stamp of excellence. The writer has been familiar with the sale offerings at Anoka for many years, and does not hesitate to pronounce the cattle that will be offered for public approval December 1st, the best lot that has ever been submitted by Anoka, and he believes their superior could not be produced by any other breeding establishment in the country. They are the last word in high-class Short-horns, and deserve the utmost consideration at the hands of the breed's adherents.

A handsome photogravure of this remarkable lot of cattle has been prepared, and one of these together with a catalog for the sale will be sent to any address upon application. The production is deserving of the widest possible distribution.

(Signed) FRED V. JOHNSON, Wisconsin Farmer representative.

A special train will leave Chicago for Waukesha, over the Chicago & Northwestern Railroad at 8:40 o'clock, Saturday morning, December 1st, arriving at Waukesha at 11 o'clock. Returning it will leave Waukesha at 5 p. m., reaching Chicago at 7:30. Applications for catalogs and photogravures should be addressed to Anoka Farms, Waukesha, Wis. Kindly mention this paper. Colonels Jones and Reppert will sell the cattle.

SHORT-HORN CATTLE.

Short-horn Steers Break World's Record

FORTY SHORT-HORN STEERS, weighing 1,692 lbs., bred in North Dakota, fed in South Dakota, topped the Chicago market July 9th at $14 per cwt., averaging $236.88 per head. They were part of a shipment of eighteen loads of Short-horns, 263 head, which sold for $55,025.39, averaging slightly under $210 per head. Market authorities pronounce this performance without a parallel for all time and regardless of breed. **The Short-horn is the breed for you.**
AMERICAN SHORT-HORN BREEDERS' ASSOCIATION 13 Dexter Park Ave., Chicago, Ill.

HOLSTEIN-FRIESIAN CATTLE.

Grahamholm Bargains

$750 WILL BUY this handsome 30-lb. grandson of King Segis, born Feb. 27, 1916. As indicated by the cut he is a striking individual, well marked and ready for active service. His sire is likewise a good individual and a worthy son of the great King Segis, having already 14 A. R. O. daughters to his credit. His dam, Pauline Govers De Kol 2d, has 30.03 lbs. butter, 569.50 lbs. milk, 7 days, 122.18 lbs. butter, 2,442.50 lbs. milk in 30 days. Also captured the 32d association prize in 1914. Write for particulars.

W. J. BOYNTON, Mgr.
Rochester Minnesota

Govers Pauline Segis Grahamholm (185290)

We have eight 30-pound cows in our herd now carrying calves by the best bulls in the east.

It will pay you to keep your eye on these calves as well as others equally well bred.

Hillside Holsteins

FIVE registered cows, four have A. R. O. records up to 19 lbs. Price, $1,000. Five nice heifers, some bred to our herd bull, 31 lbs. in a week, 1,146 lbs. yearly. Price $800. Write or come and see him.

KIRKPATRICK BROS. Reedsburg, Wis.

HOLSTEIN BULLS

Last Chance

To Get the

Genuine New Edison

at the

Old Price!

Here is your chance, and it's the last one! The very last announcement that will be made in this paper before the big increase in price on the New Edison Phonograph. Price goes up positively on January 1st, 1918.

Orders for this increase have come from Mr. Edison himself. High cost of materials and labor have made it necessary. Mr. Edison regrets the necessity of this price raise, but conditions make it essential. So, if you want a New Edison, now is the time to get it. Don't put it off. Act now!

Still Only $1.00

After Free Trial!

You may have the old offer if you hurry. But there's no time to be lost. Rush in the coupon below. Mr. Edison's great new phonograph with the new diamond stylus reproducer and 12 of the very latest Blue Amberol Indestructible Records sent to you on absolutely free trial. ***Send no money!***

If you wish to keep Mr. Edison's superb new instrument after the free trial, send us only $1.00. Pay the balance of $36.90 which includes the small war tax of 90c effective at once—for the complete outfit in easy payments of only $3.50 a month.

Think of it—a $1.00 payment, and a few dollars a month to get this outfit of Mr. Edison's new phonograph with the Diamond Stylus Reproducer, the life-like music—the same wonderful Blue Amberol Records—all the musical results of the highest priced outfits. The *finest* the *best* that money can buy at very much less than the price at which imitations of the Genuine New Edison are offered.

After years of labor on his favorite invention, Mr. Edison has made the music of the phonograph true to life. There is no reason, now—especially since we make this rock-bottom offer—why should you be satisfied with anything less than Mr. Edison's genuine instrument. You are under no obligation on this free trial offer.

Hear the New Edison in your own home before you decide to buy.

MAIL Coupon Below!

Convince yourself first. Get the New Edison in your home on free trial. See what a wonderful instrument it is—how it brings the music of the world's greatest singers and players, the sweet, old time melodies the jokes of the funniest vaudeville actors, all right into your parlor as if they were there **in person.** See for yourself how much you **need** the New Edison in your life. See how much happier it will make your home. Just fill out the coupon and send it in. No money down, no C. O. D. You pay us nothing unless you keep the outfit. Send it back if you wish **at our expense.** Or pay only $1.00 after the trial, and $3.50 a month until you have paid $36.90. Send coupon today.

F. K. BABSON, Edison Phonograph Distributors
4598 Edison Block — Chicago, Illinois
Canadian Office: 355 Portage Avenue, Winnipeg, Manitoba

A Remarkable Offer—But You Must Hurry!

Outfit No. 36 Latest model concealed horn instrument. Finished in beautiful fumed oak—elegantly polished. Price, with 12 Blue Amberol Records still, only $36.90. Big increase in price on January 1st. (See terms in coupon below.)

No obligation to buy in sending this coupon; this is just an application for a Free Trial

F. K. BABSON, Edison Phonograph Dists., 4598 Edison Block, **Chicago, Ill.**

Dear Mr. Babson:—As per your offer, I should like to hear Mr. Edison's wonderful new style phonograph with the new Diamond Stylus reproducer in my own home on free trial. Also send me twelve records. If I decide to keep the outfit, I will have the privilege of the rock-bottom price of $36.00 (plus 90c war tax, to be included either with the first payment of $1.00 on your outfit, or with the first monthly payment, just as you prefer) direct from you on special terms. I merely agree to take the outfit promptly from the depot, pay the small freight or express charges, and if I do not find it thoroughly satisfactory, I reserve the right to return the outfit at once at your expense. Otherwise, I will send the first payment of $1.00 within forty-eight hours after the free trial or as soon as possible, in no case exceeding one week, and will make monthly payments thereafter of $3.50 for 10 months. The outfit is to remain your property until the last payment has been make.

THE WISCONSIN FARMER

VOL. XLVI. NO. 48. THURSDAY, NOVEMBER 29, 1917. WHOLE NO. 1870

Forty-sixth Dairymen's Convention

WITH a particularly excellent program arranged for a three-day session, the Wisconsin Dairymen's Association met for the forty-sixth annual meeting of its existence at Janesville, November 20th to 23d. In spite of the extra efforts of the officials to provide speakers of national reputation for this meeting and in spite of the fact that more than 200 Rock county dairymen and business men had signed the petition for holding the meeting in Janesville, promising a good attendance at each session, there were fewer people there during all of the three days than an ordinary institute draws in a one-day meeting.

Because The Wisconsin Farmer believes the program of particular importance to all dairymen the report of the meeting will be made as complete as the space will permit. It must have been a matter of considerable discouragement to the speakers, some of whom traveled many thousand miles to address the meeting, to find only so few dairymen present.

A feature of the meeting was the address of the Hon. Carl S. Vrooman, assistant secretary of the United States Department of Agriculture. In a straightforward manner Mr. Vrooman brought out the great importance of agriculture in this war. Mingled with his discussion on the agricultural efforts which must be put forth by the American farmers was a fervid plea for greater patriotism. His whole speech and the sincerity of its delivery and the earnestness which showed in the face of the speaker, gave the audience no doubt as to the importance of winning this war. Speaking in particular of dairy products, Mr. Vrooman said: "No country in Europe has enough dairy products or will have for years after the war is over to feed her own people. Herds are depleted and decimated and the call to fill the demand of these countries will come to us. The specter of famine is just over the skyline everywhere in Europe and undernourishment stalks about. The lack of dairy products is the reason for the universal undernourishment from which all the warring nations excepting America are suffering. We have seen the necessity of having a supply of these products, and we must be able by united efforts to continue having an adequate supply of dairy products." The rest of the address was filled with the arguments for supreme patriotism in every direction in order to bring the war to an early and victorious conclusion.

Cow-testing association work, which has been carried on for the last eleven years by the Wisconsin Dairymen's Association, was excellently set forth in the address of Noel Negley, of Madison, who has charge of this work for the association. Greater efficiency, as brought out by means of cow-testing associations, was urged by Mr. Negley. "The dairyman has realized that a good producing cow, well fed and cared for, will make him more money now than ever before but the low-producing cow with the poor management that usually accompanies it, will put him in a hole faster than ever. The dairyman has been dumped into the creek by the critical times we are passing through now and given the comforting advice, 'Sink or swim.' Some have sunk and in many instances the dairy industry of the country has been benefited by the sinking." Mr. Negley's observations, based upon the intimate knowledge of eighty-four associations, with its 2,500 members, and representing the work of 41,200 cows, puts him into the class of those who can talk with authority on the question of efficiency. For every criticism he has for the inefficient dairyman, he also has at his disposal hundreds of proofs of the correctness of his assertions. Mr. Negley is not satisfied with Wisconsin's showing in the cow-testing work. Though the eighty-four associations now operating successfully represent a greater number than can be found in any other state of the Union, there is reason, according to Mr. Negley, for feeling ashamed of Wisconsin. "Here we have a great industry," said Mr. Negley, "made up of over 150,000 dairymen whose annual value of dairy products is approximately $140,000,000 and whose investment in land, cattle and equipment is probably at least $2,500,000,000, with absolutely no records of cost of production or other bookkeeping excepting that of the 2,500 men in cow-testing associations and 450 men in farm management work. Any little one-horse storekeeper with a stock of $1,500 takes his annual inventory, knows the cost of each article and the profit on it at such a price and keeps a complete set of the records." Mr. Negley emphasized especially the present-day conditions as a reason for learning to the last cent the cost of each farm operation in order to have better homes and the greatest of all

CURRENT EVENTS

THE British made a highly successful assault upon the Germans in northern France last week and proved that the vaunted Hindenburg line is not impregnable after all. General Haig, the British commander, launched a far-flung attack upon the German lines when it was least expected, not preceding the infantry charge by a terrific artillery bombardment, as has been the case heretofore. The result was that the Germans were taken by surprise. The infantry was accompanied by a large battery of heavy tanks, as the converted tractor fighting machines of the British are known. These tanks lumbered their way through the German wire entanglements and over the trenches and shell holes almost as though they never existed. The result of the first day's attack was that the British forced their way through the German lines for as much as five miles, in some places, over a breadth of thirty-two miles. They were still pressing forward at last reports. Approximately 10,000 Germans were taken prisoners, along with a number of heavy guns. The attack was the most successful the allies have made in several months and goes a long ways toward offsetting the Teutonic advances in Italy. The attack was witnessed by General Pershing, although the United States troops did not participate. The Canadians covered themselves with glory, as has been their wont ever since they entered into the fighting over in Europe.

THE Italians have rallied and are making a determined stand against the advancing Germans and Austrians on the banks of the Piave river. Dikes were cut and much of the country in the vicinity of Venice was inundated, resulting in large number of the invaders being drowned, others being marooned where they could be captured or killed, and others being driven back to the main lines. The British and French reënforcements have arrived to strengthen the Italian lines and altogether the situation looks much better than it did a week ago. The fighting is so near to Venice that the guns can be heard there, but no shells have yet struck this famous city. Should the Germans and Austrians succeed in pushing ahead, Venice will undoubtedly be surrendered, as it is an unfortified city and the Italians will not want to sacrifice the priceless art treasures with which Venice is filled. At this writing, however, it looks as though the invaders might be pushed back, or at least held in check, and that Venice may not have to be either surrendered or sacrificed. The Italian troops have gotten their second wind and are fighting strong again.

WHILE the United States and Germany are at war, such a state of affairs does not exist between this country and Austria, Germany's chief ally in the present struggle. Whether war shall be declared upon Austria, as is demanded by Theodore Roosevelt and many other national leaders, promises to be a subject of considerable discussion at the next session of congress, according to Senator Hitchcock, of Nebraska, ranking member of the foreign relations committee. In his opinion the question presents many complications and is one of extreme delicacy as well as important in immediate and future developments of the war. "A declaration of war against Austria-Hungary," said Senator Hitchcock, "might be construed as indorsement of Italy's demands upon Austria. These include a demand for territory which virtually would deprive Austria of every seaport—a fruitful situation for a future war. It is a question whether the United States would be willing to give such an indorsement." Senator Hitchcock said he anticipated that the coming session of congress would be a long one and that from observations during the recess, he believes the public is giving wholehearted support to the war.

THE war bureau of the national committee on prisons and prison labor presented to government officials plans for the collection and disposition to good advantage of junk and other waste accumulated on farms. The committee recommends that the farmer be called upon to collect waste materials and deliver them to county penal institutions, where they would be sorted out and sent to industries as needed. This plan, it is said, would not only regulate the flow of scrap to the market, but would enable institutions to find new means of employment and new sources of revenue which can be applied for the benefit of the prisoners and the institutions.

CHAOS seems to continue in Russia, neither Kerensky nor any other leader having succeeded in restoring even a semblance of order. The forces which overthrew Kerensky are reported to have asked Germany and Austria for an armistice, until peace terms can be discussed which shall end the war so far as Russia is concerned. In the meantime, no shipments of supplies will be permitted to go from the United States to Russia until the situation in that country clears. The American government before allowing the export of goods already on the docks wants to know into whose hands they will fall on their arrival. If the forces which overthrew Kerensky gain control and pursue their program calling for peace with Germany the embargo will be permanent. The provisional Russian government was given credits amounting in all to $325,000,000, of which $191,000,000 already has been advanced. Much of this money has been spent for supplies now awaiting shipment, and the Russians have been given vessels for its transport. Shipments will be held up by denial of bunker coal to the ships.

PRESIDENT WILSON was given a free hand by the railroads in his effort to avert a strike for higher wages by engineers, conductors, trainmen and brakemen. Formal announcement by the railroads' war board that the railroads were ready, should any crisis arise, to place their interests unreservedly in the hands of the president for such disposition as he may determine is necessary in the public interests was expected to clear away misunderstandings of the four brotherhoods over the attitude of the roads, which had caused the unions to refuse to arbitrate the dispute. Possibility of a stoppage in the steady flow of commerce, thereby paralyzing the nation's war preparations, is believed by officials to have passed. They expected that an agreement to leave the wage question to an impartial tribunal would result and already suggestions for means to forestall any further agitation concerning wages and conditions of work during the war, which at the same time would protect the workers in maintaining their standards of life in the midst of war prices, are under consideration. England's example of allowing the board of trade to regulate wages at intervals of several months and at the same time adjust rates to protect the railroads is being given close study.

ALL alien enemies are required to register and to obtain permits for travel, under a proclamation issued by President Wilson. Enemies also are prohibited approaching within 100 yards of water fronts, docks, railroad terminals or storage houses and are forbidden to enter or reside in the District of Columbia. Only Germans will be affected by the proclamation, as it specifies "enemies" and not "allies of enemies." Germans will be barred from employment on all vessels on the ocean or the Great Lakes, and even from traveling on private motorboats of their own. The proclamation applies to continental United States and to the Philippines, Porto Rico and Alaska. The penalty for violation will be internment for the war. Officials explained that the government's action is not intended to be vindictive and that Germans who mean no harm to the United States will not be molested. Under regulations now being framed by the department of justice all Germans may be required to report periodically to officials. The regulations will be promulgated within a few days, but the terms of the president's proclamation become immediately effective.

AMERICAN shipyards whose construction was commandeered by the government, completed last week 20,000 tons of merchant shipping. The shipping board announced that this brought their total output since the commandeering order was issued August 4th, up to twenty-eight vessels of 159,000 tons capacity. With speeding up processes under way tonnage soon will begin to come from the yards at a much faster rate than that, shipping board officials predicted. The first ship of the government's great fleet of nearly 1,000 vessels for which contracts have been let, will be completed in the Skinner & Eddy plant at Seattle, November 24th. It is of steel of 8,800 tons capacity and designed for a speed of eleven knots. The first of the wooden ships will be launched about December 1st.

AMERICAN naval experts do not agree with the view that the lull in submarine activities indicates a collapse of the U-boat campaign or that anti-submarine measures have proved wholly effective. They agree that progress is being made against the menace, but prefer to postpone judgment on whether the U-boat has been eliminated as a factor until the theory has been more thoroughly tested. Meanwhile the American navy will continue its preparation to deal with the menace. It was said officially at the navy department that there was nothing to forecast the possibility of a very heavy toll of ships next week, or at any subsequent periods and that varying results from week to week still were expected.

Crop Yields for 1917.

Some reduction in the estimated yield of corn is shown in the government crop report for November, but the total is still higher than the previous record production. The crop is placed at 3,191,083,000 bushels compared with the estimate of 3,210,795,000 bushels a month ago and 2,583,241,000 bushels raised last year. The crop in point of quality, however, is the poorest on record, being 10 per cent below the ten-year average of 84.2. This was due to the fact that the crop matured later than usual and much of it was caught by frost before it had fully ripened.

Yield of corn per acre is given as 26.4 bushels compared with 24.4 last year and ten-year average of 26.0 bushels. The percentage of corn still left in farmers' hands from the old crop is exceedingly small at 34,745,000 bushels. A year ago there were 87,908,000 bushels on farms, while the five-year average is 100,523,000 bushels.

A potato crop of 439,686,000 bushels is indicated compared with 285,437,000 bushels last year and 362,910,000 bushels, the 1911-15 average. Yield per acre is placed at 101.1 bushels against 80.4 bushels last year. Quality of the potato crop is 3.0 per cent above the ten-year average.

Production of sweet potatoes is estimated at 84,727,000 bushels compared with 70,955,000 bushels last year and 1911-15 average of 60,257,000 bushels. Yield per acre is placed at 93.7 bushels and quality of the crop is 1.8 per cent above the ten-year average.

Flaxseed production is given as 9,648,000 bushels compared with 15,459,000 bushels last year, with quality of crop 1.3 per cent under ten-year average. Kafir corn production was 73,380,000 bushels against 50,340,000 bushels last year.

Weight of wheat per measured bushel is estimated at 58.5 pounds against the ten-year average of 58.2 pounds. Oats, weight per measured bushel was 33.4 pounds compared with ten-year average of 31.6 pounds. Barley, weight per bushel, was 46.6 pounds against 46.6 pounds, the ten-year average.

The buckwheat production of 16,813,000 bushels fell below early forecasts, although it is up to an average in total production compared with former years.

The tobacco crop of 1,185,478,000 pounds is the largest on record.

A Workshop on Every Farm.

To the Editor:—Throughout the year, if a farmer has a roomy and fairly equipped workshop, very many jobs of repairing farm tools and general equipment can be done. On a farm there is always something in the way of repairing buildings, farm tools and implements, and new small articles to make, and not only is much time often saved, but the usual expense of such work is avoided.

It is during the winter season a farm workshop is of the greatest value. If it is light, heated with a stove, and a fair amount of tools possessed, the farmer and his boys, and perhaps some regular hand employed, can very profitably spend cold, snowy and rainy days doing various kinds of mechanical work and all enjoy it. There is no better pastime for the boys and by a little practice and perseverance they can be made very handy with tools.

If a farmer is compelled to call in a regular mechanic when any repairing is needed, or is under the necessity to send to some shop in a neighboring village everything that needs mending, he is always paying out cost to get that done which if he had a shop and possessed some tools and skill and he and his boys could do it themselves and be all the better in many ways for such work.

There is no doubt but what if farmers' sons were rightly instructed and some pains taken to teach them to use farm tools and machinery they could be made as good mechanics as farmers. So it is good and profitable to possess a farm workshop. W. A. G.

Stocks of pork provisions in Chicago November 1st aggregated only 62,362,592 pounds compared with 93,305,932 pounds a month ago and 81,503,145 pounds on November 1st a year ago. It is up to the hog raiser to bring the pork supply back to normal.

Economical Luxury in California

Living is inexpensive in California. Don't forget this when planning your winter outing. You may look forward not only to the finest scenic and climatic conditions to be found in any other winter resort, but there the cost of living is less than you pay at home.

Let the Department of Tours tell you more about how you can cut the cost of living in California this winter. Our travel experts are at your service to help plan your trip, start you in comfort and see you established at journey's end.

Over the Salt Lake Route

One picture after another; the Great Salt Sea glistening in the sun; the Mormon City, the renowned Tabernacle, the famous organ. Stop over if you like, then ever westward through mountains, by way of beautifully colored Rainbow Canyon, and southward into Southern California, the land of opulence in fruit, flowers, sunshine.

Send for booklet "Making California Easy," and learn about the wonderful free service of our travel experts.

The Wisconsin Farmer

THURSDAY, NOVEMBER 29, 1917.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

THE FARM LABOR PROBLEM.

I FIND the case of the farmer, whose help has been snatched away from him by the attitude and action of our army exemption boards, admirably set forth by the Philadelphia Stock Exchange. This organization of business men in America's third largest city has passed a resolution urgently recommending that the government adopt a policy of conscripting men (from the city and other lines of work) for agriculture, just as it does for military service. It holds that this is absolutely necessary if a large crop is to be planted and harvested next year. The resolution states that unless some such action is taken by the government the farmers will refuse to plant the maximum acreage asked for by the food administration.

The statement made by the Philadelphia Stock Exchange applies to agricultural conditions in the East, but it fits grain-belt conditions equally well, so I hope you will pardon me if I print the major part of this ringing declaration, as follows:

We have been advised by farmers of this section of the country, who this year "did their bits" in planting to capacity, that they will not do so next spring unless assured by the government that they will be given sufficient labor for the harvesting. Despite high wages and charges for fertilizer and other production factors, they are willing to plant maximum acreages again, but only with the guarantee that they will be given labor to harvest their crops.

This depletion of the farm labor supply is continuing. Eleven men sent by the Federal Employment Service last week to a New Jersey farmer were immediatly snatched from him for cantonment building, and these eleven were to replace skilled farm hands who had been drafted. This case is typical of many others. Pennsylvania, New Jersey and Delaware are especially suffering because of the number of shipbuilding, munition and other war plants and army cantonments concentrated near by and because of the character of the farming of this region, which requires for the most part skilled men. It is idle to talk of placing schoolboys on farms in sufficient numbers and to exhort farmers to plant. They must be given labor, and of the right kind, which cannot be had except through a scientific system of mobilization, placement and overseeing by the government.

Many of those workers whom farmers are now obtaining refuse to stay long in employment and leave after making a considerable sum by a few days' work. This aggravates the situation, as farmers frequently attempt more on the strength of the employment of these additional men, upon whom they rely for the completion of the tasks begun.

The government must quickly perfect and put into operation a scheme whereby farmers will be assured that their skilled men will not be drafted for military service, whereby those now employed will be kept at work (wages and living conditions, of course, being fair and proper) and whereby they will be assured that their help will not be taken from them by other industries at a time when it is most needed. Agriculture must be placed upon the same basis as the military, with supervision over labor to insure the continuance at work of the labor, on one hand, and fair treatment from the farmers on the other.

The allies and our own armies are dependent upon our farmers for food, and food production must be organized as quickly and as thoroughly as possible. Our farmers are patriotic enough. They are willing to plant to capacity and to pay high wages, but they are right in their demand that they be given and guaranteed a stable, efficient and sufficient labor supply.

What is here set forth as true of the farmers of Pennsylvania, New Jersey and Delaware is even more true of the farmers of Wisconsin, Iowa, Illinois, Nebraska, Missouri, Kansas and all the rest of the grain-belt states. In many respects the farmer has been given the worst of it this year. He was urged by governmental agencies to increase his crop acreage to the maximum, as a patriotic duty; to use fertilizers in order to secure the largest possible yields per acre; to cultivate with care —in a word, to do everything possible in order that production might be magnified to the fullest extent for the needs of America and her allies.

The farmer did as he was urged so strenuously to do, as is shown by the wonderfully increased production of practically all field and garden crops this year. The farmer kept the faith, but others did not. Just as he was about to harvest his bumper crops along came the selective draft, and in most cases his claim for exemption on the grounds of agricultural necessity was denied. Production, on the very point of being materially increased, began to suffer materially and this despite the fact that increased acreage had yielded more per acre than ever before. It is an absolute fact that corn was gathered too early on many farms, for fear of a further depletion of the farm labor supply, with the result that thousands and tens of thousands of bushels are steaming today in grain-belt corn cribs, almost a total loss, because the farmer gathered it too soon for fear of not being able to get help to gather it later. And this year's experience is not a tithe of the cost we will pay next year if this shortsighted policy is not changed. It is possible to fool some of the people all the time and all the people some of the time, but it is going to be impossible to fool all the farmers next year as they were this year.

I am glad that the Philadelphia Stock Exchange has shown so broad a spirit in facing this great national problem, so closely connected with winning the war. Its attitude is in delightful contrast to that of some city libelers of the farmers. But excellent as their intentions undoubtedly are, they have not gone to the root of the matter, at least so far as grain-belt agriculture is concerned. I have little hope that their suggestion for conscripting city labor for farm use will prove of practical value through the Central West. It might help a little here and there, but the thing needed is to exempt the farmer himself entirely from military duty at this time, the same as we would exempt the munition maker. His place can be taken in the trenches by the city's unemployed, without any loss of efficiency, but his place cannot be taken on the farm by any unskilled help. I would as soon think of putting a "drifter," picked up from the city streets, at work on one of my farms as I would of putting him into my office to manage this paper for me. Farm help, to approach the maximum efficiency necessary to supply our army and our people, as well as those of our allies, with food, must be experienced, and the only way to get it is to leave the farmer on the farm, where he will be of more value to the nation a dozen times over than in the trenches.

It is up to us here in the grain belt to make our voices heard on this matter in no uncertain tones, so that its swelling volume will carry into the offices of governmental theorists at Washington and make them understand that we must have farm help next year if crop production is not to suffer to such an extent that the whole world will suffer and our high hopes of making the world safe for democracy be defeated. I believe this with all my heart and soul and mind, and I am urging it solely for the nation's welfare.

A WINTER OF SAVING AND SACRIFICE.

I FIND that the great majority of farmers are just as anxious to save food as they are to raise it; that conservation seems as important to them as production. They do not believe in skimping to the point of niggardliness, but they do realize that every bit of food saved will go toward winning the war, toward making the world safe for democracy. Garbage never was so important, nor so inexcusable, as now.

You may recall that a few weeks ago I printed a very interesting letter from Mr. H. C. McLean, who, like myself, had received the rudiments of his education in a log schoolhouse, who pioneered in the grain belt when land was being homesteaded for $1.25 an acre, and who has literally seen miracles wrought in our fertile Middle West. Mr. McLean told how he uses a small gas engine and a small mill to grind his own whole-wheat flour, how palatable and nourishing they find it, and how it has improved the health of the whole family. If I am to judge by the great number of letters which I have received within the last few days, Mr. McLean is only doing what many others among my readers are doing. What with the housewives busy last summer putting up fruit and vegetables, with home butchering and with home-ground flour served on thousands of farm tables, it begins to look not only as though the farmer were well-nigh independent of the "butcher, the baker and the candlestick maker," but that he is "doing his bit" in saving food for the soldier boys in the trenches and camps.

None of the letters I have received commenting on Mr. McLean's is more interesting than the one from Mr. J. C. Needles, who tells how they solved the bread problem in their household without going to the expense of buying a gas engine and a power mill. Let Mr. Needles tell the story himself:

Dear Mr. Pierce:—Some years ago we learned the value of graham bread for conserving the health, and we learned to like it much better than the fine white bread, but found it often impossible to get good graham flour. Finally we hit upon the plan by buying a small grist mill at a cost of about $3.50, which we fastened to a small table in the summer kitchen, and by getting good recleaned wheat we ground our own flour at the cost of good milling wheat.

At the present price of wheat our flour cost us $3.50 per hundred and it is the best breakfast food we have ever found. There is nothing at all taken out of the wheat and the bran is ground up fine enough to be palatable. We generally grind enough to last a week or two at a time and we do not notice the time used in grinding it, and the mill will last a good many years. We can grind anything the larger mills will grind, but slower, of course.

We have never cared much for biscuits, but we like graham gems baked in the little gem pans, although we generally have the bread baked in loaves. To make the best graham bread we set the yeast at night the same as for ordinary white bread, using white flour, then in the morning when it has raised we work it up with one-half white and one-half whole wheat flour; then when it raises the next time work it out in loaves and put in pans to rise and then bake without letting it rise the second time as is generally done with light bread. When handled properly it makes a nice light loaf which is better when a couple of days old than when first baked, and we find that company who have never cared for graham bread nearly always prefer this to the white bread.

Practically all doctors admit the value of bran as a laxative and also to furnish valuable mineral salts necessary to the health of the body and, in a way, we get medicine as well as food, and conserve the wheat supply at the same time. No family in town need be without good fresh graham on account of not having a gas engine or mill if they will use this method. Good graham mush with cream and sugar makes a fine food for the "kiddies" as well as the old folks.

Here is a splendid example set for all of us. We need not make a large investment in order to save, although there is hardly an investment we can make which will bring better returns, in the long run, than a gasoline engine. But if that is impossible, for the time being, Mr. Needles has a way out of the difficulty. With graham gems, whole-wheat flour, corn bread, johnnycake and so on, we shall not only save food this winter, but build ourselves up into splendid physical condition and be ready to do still more and better work next summer.

While on this subject I want to print another letter brought out as a result of the publication of Mr. McLean's. This one comes to me from an R. F. D. carrier, who preaches a good sermon on the good we can all do, if we will only look about us. Mr. M. A. Crawford writes me as follows:

Dear Mr. Pierce:—This being Sunday night, and getting my chores over early, I picked up your good paper and read your personal page. Two sketches that I ran across were very impressive and show that there are others who are thinking and doing, and how easy it would be for still others to do if they would only try.

Now, to begin with, I must say that I am not quite as fortunate as Mr. McLean—I haven't the mill and am only an R. F. D. carrier with a small farm as a side line. I managed to raise a little wheat and a little corn, so for about a month have been eating corn bread once a day and whole wheat bread twice a day, except when we have company, then we have white bread, as the children call it. Besides saving, I find it beneficial to the health. I feel far better now than before I commenced to use it.

As to lending a helping hand, we have a little boy in our district whose mother is a widow and very poor. She could not clothe him warmly enough to send him to school, so I put in my little mite, made my way around in the district, and in about two and a half hours had enough money to dress the boy in good shape for some time. I am not writing boastingly, but to show that someone must start these things. Let each and every one of us ask ourselves the question, "Am I doing what I can for my country, myself and my neighbor in these times of war and strife?"

Do not such letters as these shame us all into cutting out the unnecessary extravagances and saving wherever and whenever possible? Many of the soldier boys who have gone from our grain-belt farms have left needy and worthy folks behind them; shall we not look around and see where we can lend a helping hand, where a little bit of sympathy and financial aid will help the most? It can be a busy, a useful and an inspiring winter if we will only make it so. Shall we form a "Lend a Hand" club, to help those who need it and thereby better ourselves in every way?

THANKSGIVING THOUGHTS.

A SUBSCRIBER writes to me as follows, in regard to Thanksgiving Day this year, as it differs from other years:

Dear Mr. Pierce: With the whole world at war, with American soldiers being killed and wounded in France, and with our dear farm boys being taken from us, just when they are needed most, what have we got to be thankful for this year?

I sat for a long time, after I first read this letter, looking out of my window, not seeing anything, just thinking. I thought of what a terrible life, what a terrible world, it would be if might were

(Concluded on page 6.)

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES.

BY JAMES M. PIERCE

JAMES ATKINSON, EDITOR-IN-CHIEF

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter.

PUBLISHED EVERY THURSDAY

1912 Grand Avenue Des Moines, Iowa — 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscriptions or advertising may be addressed.

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address THE WISCONSIN FARMER, Madison, Wisconsin

Fertilizers for Wisconsin Farms.

The fertilizer question has been a matter of much discussion, but comparatively few trials have been made either by experiment stations or on farms. Tobacco and potato men have long recognized the healthful qualities of phosphate fertilizers for increasing crop yield. However, no very extensive tests have been made by the soils department of the college of agriculture or any othr persons. Experiments are under way now at many of our county experiment stations which will throw considerable light on the subject. However, the experiments conducted at the Ashland station will do Walworth county little or no good in solving fertility questions.

Fertilizer experiments should be carried on by county agents or the college of agriculture in every county of the state and where soil conditions vary greatly within the county two or three different sections should be investigated in order to have all types and soil conditions represented. There is no more need for fertilizer in Wisconsin than we realize. The old belief that our fertility is still well preserved and the warnings regarding soil fertility depletion apply only to the neighboring state or county should be revised.

Fertilizers are important for increasing crop production. But fertilizers and their application must be thoroughly understood. A campaign to set forth clearly the uses and abuses of fertilizers does little or no good whatsoever unless such campaign includes practical demonstrations on fields within a reasonable distance of every farming community in the state. Such a start as we have said has been made by the county experiment station located at Marshfield, Ashland and other places. However, much more work is necessary than is now being done and more money is required than is now available to the experiment station workers. Whatever facilities there are now at hand are being used to the fullest extent both in increasing the number of experiments and their distribution throughout the state. The importance of the subject, however, particularly in these times when maximum production is all important, warrants greater speed regarding this phase of increasing yields.

There is more money needed, more workers needed and a general expansion to cover all districts necessary in order to bring this about. Everything that we can do to hurry the work is to our advantage. It will help keep Wisconsin in the front rank as an agricultural state and make each and every farm more productive and more profitable to its owner.

Register of Production.

Cows in the cow-testing associations of Wisconsin are not to go unrewarded for their work in the future. The Wisconsin Dairymen's Association has just adopted the plan of Noel Negley, who is in charge of the cow-testing work in the state, to provide for a Register of Production, in which all cows producing 365 pounds of butter fat in a year will be entered. The accuracy of the records will be attested by the owner, the secretary of the local organization and the cow-tester. The charge for entering a cow into this Register of Production will be 50 cents. At the end of each year a book will be published containing all the names of the cows with a record of 365 pounds of butter fat or better.

The reasons for this move are sound principles. The recognition of the grade or pure-bred cows with creditable records is thus assured. Records will also increase the interest in the purchase and sale of cattle on the basis of production. The probability is a further increase of interest will be manifested on the part of those owners having the good-producing cows so that more rapid improvement will take place in individual herds and communities.

The registration slips will be signed by the secretary of the Wisconsin Dairymen's Association, which organization in connection with the University of Wisconsin, is fostering the cow-testing association work. Wisconsin has again stolen a march on all other states by this move.

Discussing the Milk Producer.

B. H. Hibbard, of the Wisconsin station, has been making a study of the market milk situation and he discusses in a series of papers some of the marketing problems which enter into it. For milk going to Chicago at $3.22 per hundred pounds, Mr. Hibbard has figured the division of the consumer's cost to be 7.10 cents for the farmer, .56 of a cent for the railroad, 1.59 cents for the dealer at the plant and 2.50 for delivery. Assuming that each person or firm which handles the milk makes a fair profit on the above basis (and some of them dispute the claim), the price to the consumer would be 11.75 cents a quart, or, to make the cents come out even money, 12 cents a quart. Discussing the claim on the part of the producers that they have a right to a price commensurate with cost with a fair profit added, Mr. Hibbard says:

In recent controversies the representatives have been assuming that he is entitled to a price covering all costs of production and even a profit beyond. This is a reversal of the usual operation of price-making forces. Take, for example, the case of a hog. When prices are a little above cost the pork prduction is suddenly stimulated. When it is below cost the opposite effect is almost immediately produced. A farmer who wishes to produce a great deal of pork next year does not necessarily produce much this year. A man who expects to produce much milk next year must, on the contrary, produce much this year. It is not practicable to keep ten cows one year, forty the next, and then drop back to ten.

Again the producer of milk cannot avail himself of much competition in selling it. With horses or hogs he can withhold them for weeks; can decide which of several markets are best at a given time; can even take them back home and hold them still longer if the price is unsatisfactory. With milk there is no such thing as holding back; it must be sold at once. The farmer who sells to a dealer must make a bargain to cover some period of time as a month or half a year. The competition of the other uses to which milk may be put, as for butter or cheesemaking, is not by any means always adequate in guaranteeing a fair price, since more is required in the production of city milk than for these other purposes.

The farmer may seem to have a right to a price which covers costs, but an unenforceable right is hardly a right at all. He has more nearly a right to what the market will afford. But this does not mean that his rights are determined merely by what a few dealers choose to give him. As in every other similar case, for instance that of labor, the time comes when collective bargaining is the only logical solution.

Farmers have not been adroit in organization. They have, however, been honest. They have felt that they have a right to meet and discuss milk prices, and to name a price which is acceptable to them for their product. That this has been done by many other classes of producers is beyond question, but for the most part the public does not have access to the minutes. The farmers carried on their transactions openly. They did what common sense told them to be the logical method, but in doing so it is claimed that they violated the state anti-trust act. This may be technically true, but if so there will be a stronger demand than ever before that the right to carry on collective bargaining be granted specifically to farmers as it has been to laboring men, and as it presumably has been granted to farmers with respect to interstate commerce by the Clayton amendment to the anti-trust act. Should this weapon be taken away there will be a demoralization of milk prices, and a lot of disgusted, discouraged farmers and out of it a demand for a modification of the anti-trust regulation.

So much for the farmers rights. How about his responsibilities? The farmer has been called unpatriotic and grasping. Suppose his lot be compared with that of the manufacturers, whose business has been regulated and the percentage of profits predetermined. In these cases all costs are taken care of and a profit of some 10 per cent all but insured. The farmer does not ask to be guaranteed 10 per cent, but hopes to be given a fighting chance to make a profit corresponding to the rate of interest which he pays.

If it be the duty of the farmer to provide the consuming public with milk, is it the duty of the public to pay reasonably for the service, or shall the service be in part on a gratuity basis? Why is it not the duty of the shoe manufacturers to provide the public with shoes? Of course they are doing it, but for a consideration, and so far as anyone knows a consideration that is adequate. There is no case in court charging them with conspiracy, yet the prices on all hands have been skyrocketing with remarkable similarity. Is it the farmer's moral duty to go ahead playing a losing game until his stakes are exhausted simply because the old method of marketing fails to give him a just return? It is the farmer's duty to produce to full capacity and to market his produce intelligently so as not to lose out in the struggle for economic independence.

Assuming that all Mr. Hibbard says is true, and he certainly puts it in a very logical way, the peculiar times in which we are living should certainly be taken most seriously into consideration. The demand for milk is immutable, and we are told that food is as important as bullets. We fancy if the question of price of war ammunition were up no one would claim that it is unreasonable to charge the government for munitions full cost of their manufacture and a profit added. This is all the farmer asks for. Mr. Hibbard is absolutely right in saying that the farmer has been honest in his milk producers' organization and evidently we will also have to admit that the farmer has not been adroit. When we tell the farmer in one breath that our very future depends upon him and then tell him in the next breath or by some criminal court proceeding that we don't propose to stand by him in what is fair and right, the farmer's reasoning is taxed to account for the actions. Furthermore, if the farmer can be guaranteed a fair price on wheat and pork, why cannot the system be extended? In the end we arrive at the basic truth which is that the farmer is willing to produce milk for cost plus a fair profit and what industry in America will serve the government or the people to any greater extent?

Value of Wisconsin Farm Products.

There were many at the beginning of the 1917 crop season who were skeptical that the campaign for increased acreage and increased production in Wisconsin would result in much lower prices on all farm products. The department of agriculture has recently issued a statement of farm values of many crops, as of October 15, 1917, and these are compared with October 15, 1916. Corn was worth in 1916, 76 cents a bushel and this year on the same date the average value on the farm of a bushel of corn in Wisconsin was $1.43. Of course, the corn crop did not turn out well in Wisconsin despite all efforts. But the price would have been almost double that of 1916 if we had had a bumper crop. This is proved by the corn values on farms of the nation as a whole, where the corn crop has been increased about 600,000,000 bushels, and the price has gone up just the same. The law of supply and demand is still in effect, but it is no longer local or even nation-wide. The demand for corn is world-wide, just as it is for wheat. Even though we export corn in moderate quantities, we will export other foodstuff, and corn must take the place of the other products at home, so it is the world demand, after all, which affects the market and which is sure to keep the prices up at least for the duration of the war. A year ago the average bushel of wheat on Wisconsin farms was worth $1.55, and October 15, 1917, it was worth $1.99. A year ago oats were worth on Wisconsin farms at this season of the year 47 cents, and today they are worth 58 cents. A year ago a bushel of buckwheat was worth 96 cents and today it is worth $1.63. Barley has increased from $1.02 in 1916 to $1.21 today. Tobacco has increased 40 to 60 per cent. Hay has increased in value on farms from $11 to $15.60 per ton. Apples, on the average, have increased from 90 cents to $1 a bushel. Hogs, worth $8.80 per hundredweight a year ago were worth October 15th, this year, $16.60. This is the most marked increased in live stock values, but other meats have also increased. Beef cattle from this state were worth $8 per hundredweight on farms October 15, 1917, as compared with $5.90 a year ago. Veal has advanced in a twelve months' period from $9.30 to $12.70 per hundredweight, sheep from $5.70 to $12.70 and lambs from $8.30 to $14.50. Unwashed wool had a value on farms in this state November 1st this year of 62 cents a pound, lacking only 2 cents a pound of being double what it was a year ago. Milk cows, on the average all over the state, were listed as worth $66.70 each a year ago and today their value is given as $87.30. Horses have remained practically stationary in value, the war demand a year ago having been sufficiently active to hold up horse values and to keep them up. Two crops stand out alone this year as showing reductions in values on the farm October 15th, as compared with last year and these are potatoes and cabbage. This is due to the fact that the state produced only 13,000,000 bushels of potatoes last year when the normal crop is around 30,000,000 bushels. Cabbage was worth $2.30 per hundredweight last fall and only $1.30 this year. Onions have remained stationary at $1.25 per bushel. Tomatoes have advanced from 96 cents a bushel on the farm to $1.55 a bushel on the farm October 15th this year. Beans are worth $8 a bushel as compared to $5.55 a bushel a year ago—both prices high and the present price a record breaker. Eggs have advanced from 31 to 37 cents a dozen. Poultry has advanced from 13.7 to 16.2 cents per pound. Butter was 35 cents a year ago and 43 cents this fall.

These prices form the basis for encouragement in still greater production. There may be slight fluctuations here and there, but there is every reason to believe that farm values will continue high and that the farmer may reasonably expect to profit by the present stirring times. Those who produce milk are, of course, feeding the higher-priced feeds. Hence they are entitled to higher prices for milk and cream. A year ago bran, according to government report, was worth on an average $26.70 per hundredweight and this fall it was worth $35.20. Cottonseed meal has advanced in a year from $38.30 to $55 a ton.

More Sheep For Wisconsin.

The members of the Wisconsin Advancement Association and the Upper Peninsula Development Bureau seem to be in earnest in their effort to locate hundreds of thousands of sheep on the clover lands of Wisconsin and Upper Michigan. A meeting was held in Milwaukee last Thursday to discuss plans which had previously been talked over at the National Sheep and Wool Growers' meeting in Chicago last September and a conference held in Menominee, Michigan, in October. The purpose of the Milwaukee organization was to further effect plans and arrange for funds to the end that some feasible proposition may be presented to western sheep raisers, who will be gathered at Salt Lake City in January to attend their national meeting. There seems to be no doubt that sheep men are anxious to secure good sheep land. Of course, there is no doubt about the demand for mutton and wool. It was stated by government representatives that Uncle Sam can scarcely find enough wool to make clothing for his soldiers. There can be no doubt that Upper Wisconsin is ideally situated as to market.

Among the other questions is whether the clover lands are a good place for sheep and also whether the sheep are obtainable. As to the first question, there seems to be ample authority for the assertion that Upper Wisconsin is ideal for sheep raising. However, several things must be done. In the first place, a large area of land

(Concluded on page 8.)

Wisconsin Potato Convention and Show.

Plowing.

Selecting Seed.

Planting.

NEARLY two thousand bushels of the "world's best" in potato stock were exhibited in the live stock pavilion, on the University campus, Madison, Wis., last week. It was the sixth annual potato show of the Wisconsin Potato Growers' Association, and the show was held in connection with the annual winter meeting of this great potato society. The work of this association and the stock grown by its members are second to none in the country. While other potato growing communities have had the jump on Wisconsin in the matter of starting promotion work, there is at this time no place in America where keener interest is taken in potato seed, growing, cultivation, spraying, grading or marketing problems. The work is newer in this state but it is also much more enthusiastic than in many of the states where such work has been carried on for many years.

The big contest at the annual potato show is between the several northern counties of the state which present booths, with ten, one bushel exhibits or enough added exhibits to make a total of ten bushels, in competition for the county championship of the state. There are all the problems of potato growing back of these contests. In the first place, the exhibit must be made up of standard varieties such as the Rural New Yorker, Green Mountain, Irish Cobbler, Early Ohio, Triumph, etc. These potatoes exhibited in the state contest must be disease free, true to the generally accepted types of the several varieties, and of proper size and shape to conform to accepted rules governing types. Every possible effort is made to display the potatoes in the most attractive way, though it has been ruled by the association that appearance of the booth must count for very little in judging. Granting that all of the counties entered in this contest raise good potatoes, and that the potatoes are generally free from disease, there is an art in selection which enters very materially into the contest. Mr. W. D. Juday, county agricultural agent of Oneida county, first prize winner for four years, is undoubtedly one of the best men in the country in selecting potatoes for exhibition purposes. Of course Oneida county is a premier potato county, and it has many efficient and conscientious growers who study potato problems carefully and apply their knowledge. But after all this is conceded, it must also be admitted that the county agent has been a formidable aid to the county's prize-winning record by his ability to select from the exhibits offered the very choicest stock to meet the other exhibits representing other counties of the potato district. Oneida county won first this year in the contest, just as she has won in the last three previous years, and she deserved first—that was generally conceded. Several of the county exhibits failed to show a sufficient number of good potatoes to get full credit for the meritorious exhibits set up. Others got somewhat mixed on varieties. One county which seemed to be running neck and neck with Oneida in the contest was cut down in points by reason of the black centers found in a number of the tubers when the judges slashed the potatoes open. One county, with a splendid Green Mountain exhibit, failed to get into real close competition with the top because of the fact that a number of potatoes of the Pearl variety slipped in with the Green Mountains. But on the whole, all of those connected with selection of the county exhibits deserve commendation for their splendid selection and the growers are to be congratulated upon the progress which has been made in standardizing varieties and types in the several important potato centers of the state. The markings, of the county booths were as follows: Oneida, 94½; Barron, 90 2-3; Waushara, 89 1-6; Rusk, 87 2-3; Langlade, 87 1-3; Lincoln, 86 1-6; Marinette, 85 1-6; Forest, 85 1-6; Vilas, 84¼; Waupaca, 83 2-3; Sawyer, 82 5-6; Shawano, 77 1-6; Portage, 75; Brown, 74 1-3; Walworth, 60. The exhibitors in each of the booths and the varieties exhibited were as follows:

Spraying.

Oneida county—Triumphs, Joe Grusch, F. F. Boehm, Charles Peterson, Charles B. Kuney, H. Blumenstein, Wetman Schoenick; Rural New Yorker, F. S. Campbell, Clark G. Kuney; Green Mountain, Chris Mickelson, H. Blumenstein & Son, Clay Camp, W. P. Jewell & Son and G. M. Anderson.

Barron county—A Green Mountain exhibit exclusively, the exhibitors being M. Granum, E. Kringle, Cedar Lake Farms, Mrs. E. L. Cuff, Carl Hazelburg, Mrs. E. Kringle, Gus Kringle, Mrs. E. H. Thompson.

Rusk county—Another Green Mountain exhibit. The exhibitors were Ed Stahl, Jim Faeberg, J. A. Schmidt, John Hurless, J. A. Andress, A. E. Pinny, Henry Koter, Beldenville Farms, Fred Umbrite, A. H. Plant and Jack Schmidt.

Marinette county—Rural New Yorker, Erick Mickelson, W. L. Quaas, W. O. Nivins, L. Stark & Co., F. Lardinos, O. G. White, Boyd & Morton, C. Bolander, M. Hoffman; Triumphs, A. Bolander, Erick Mickelson.

Waushara county—Rural New Yorker, John Leach, Wiliam Riemer, Albert Jones, Fred Bartel, E. Hesnes, Elmer Williams, William Anderson, L. Darling & Son, James Gunderson, Ernest Rohde; Irish Cobbler, Ernest Rohde.

Portage county—Rural New Yorker, Louis Skogland, E. P. Tobie, L. E. Gordon, A. O. Stoltenburg, Anton Brekke, Casper Smith; Triumph, William Scribner.

Sawyer county—Green Mountain, Oscar Holmquist, Oluf Cook, Cunar Moesbek, Ed Brothen; Triumphs, J. Hoff, Nelson Mowers, C. P. West; Rural New Yorker, Dick Nelson, Swan Olson, Peter Gulickson, Walter Weingarten.

Shawano county—Green Mountain, Herman Raffoth, Roman Muscavitch; Rural New Yorker, Alfred Carlston, John Kroll, Emil Nicholson; Triumphs, Eberlein Bros., Otto Nordwig, A. E. Kuhn; Irish Cobbler, Ben Whitehouse, Herman Marotz.

Lincoln county—Triumph, F. Nibbler, E. Schmidtbauer, H. H. Kueling; Green Mountain, R. H. Clark, H. P. Hansen, R. Thielman, Roy Conant, Art Welty, F. Wrabetz, Dan Tiernay; Early Rose, Dan Tiernay, John Lee.

Forest county—Green Mountain, August Draper, A. R. Anklan, George Packard, L. S. Jacobson; Irish Cobbler, George Packard; Early Ohio, Selmer Jacobson; Triumph, C. E. Cummings; Rural New Yorker, Joseph P. Schaenzer, William Krause.

Brown county—Irish Cobbler, Burt Mason; Rural New Yorker, John Splan, John Chambers, William Herring, Jos. Vanden Plas, Alf Caelwaerts; Early Ohio, A. R. Schoen, E. C. Liebmann, Mrs. C. Liebmann, Jos. Vanden Plas.

Langlade county—Rural New Yorker, Lewis Witte, Adam Guenther, Peter Krier, Herman Schroeder, Mrs. Charles Parsons, Schroeder Bros., Charles Schotte; Triumph, John Smith, Mrs. Charles Parsons; Irish Cobbler, Oscar Nelson, Ole Jacobson, Henry Hoffman, Chris Sorrenson.

Waupaca county—All Rurals, E. Kaptichka, Charles Woodward, H. C. Frihart, O. C. Woodward, Charles Rasmussen, Frank Constance, Charles D. Larson, James Christiansen, D. C. Hayward.

Vilas county—Triumph, Charles Reed, J. W. Johnson, Peter Sandbeck, Axel Lindburg, G. G. Sanborn; Rural New Yorker, J. W. Johnson, Gus Reed, Peter Hidern, Aaron Reed; Green Mountain, Julius Trapp, Louis Grenier.

Walworth county—An exhibit of potatoes was put on under auspices of the Lake Geneva Gardeners' and Formen's Association. This was the first exhibit Walworth county has undertaken at the state potato show. A. Martini, of Lake Geneva, and Ed Sparks, of Lake Geneva, are president and secretary, respectively, of the association, which has

Family Circle Talks by the Publisher

(Continued from page 3.)

triumphant over right; if the will of a tyrant were world-wide law; if the sun were to be ushered into our lives every morning with the boom of cannon and ushered out every night with the sound of shot and shell, a day and a world given over to militarism. I thought of the sacrifice which is being demanded in so many homes, farm and city alike; of the boy whom we nursed through innumerable childish ailments, on whom we have relied for many years, to whom we have proudly pinned our faith for the future, of this boy rudely snatched from the home circle and sent out to be food for cannon and carrion crow in a distant land. I thought of how I had offered my own son in the last war, a war when there was much less at stake than now, and of how he had come back to me, safe and sound, and had been spared by Providence to be my right hand support, the comfort of my aging years. As I thought, my eyes misted with tears, for I knew there would be many a boy, both from farm and city, who would not come back. I realize that sorrow stalks throughout the land and that it will continue to stalk for long months—perhaps long years—to come. And yet, with it all and through it all, I can see many things for which we should be thankful this year, thankful as never before.

I am not thinking of bounteous crops, of good prices, of a prosperity the like of which we have never known before. These things are not to be weighed against the life blood of your boy and mine. Rather, am I thinking of the days that are to come, after I am gone, after many of you who read these words are gone. My son likewise has a son. Shall we not hand over to that grandson of mine a heritage of honor and righteousness, of world-wide liberty and democracy? Shall we not give him a fair chance to hold his head erect, to walk straight before all men, to earn a good living, to enjoy the fruits of his labor? Shall we not relish the opportunity to say to that grandson—only a little boy now, but potentially a man—that he shall be free, that no tyrant shall make him bow his head, that he shall not wear the livery of shameful servility, that he shall rear children, too, to enjoy that which we enjoy, that which we propose to pass on to him: freedom.

I am thankful that I have lived to see an extravagant nation scourged into economy; that I have lived to see a thoughtless nation lashed into thoughtfulness; that I have lived to see a careless people realize the full measure of their responsibility. I am thankful that I have lived to see a rift in the clouds of tyranny; already there are signs of the dawn, when those across the seas shall enjoy the same privileges that we have long enjoyed. I am thankful that I have lived to see our boys prove their courage. I believe that the strength and vigor of our manhood today was brought about largely by the struggles through which our pioneer fathers succeeded in grubbing a foothold in the prairie and wilderness; we have grown in body and in brain because they fought the good fight against Nature—and won. Shall there not be a still greater growth, both of body and of mind, because our children have had inbred into them patriotism and courage, honor and righteousness, a love and a peace that passeth understanding?

The war will not last forever. I hope and pray that a few months more will see it brought to a close. Next Thanksgiving Day we may bow our heads around the family table—with here and there a vacant chair, to be true—and thank God, as we never thanked Him before, for His wonderful kindness and mercy. Let us not withhold all our thanks until then. The world is being made safe for democracy, which simply means that it is being made safe for your sons and mine, and their sons throughout all the long line. Shall we not therefore give thanks that it is we who are called upon to make the sacrifice, to pay the price, rather than the golden-haired little ones tugging at our knees; that the fight is to be won here and now and not in some indefinite future, when even more may be at stake?

Nor is this all. Can we look about our family circle, our friend circle, and not see many and various reasons, this year, as last year and always, for being thankful? I leave this thought with you this Thanksgiving Day; read what the poet said and bow your heads, for it is good that we realize how blessed we are, even in the midst of sorrow and heartache:

I thank Thee, Lord, that I am straight and strong,
With wit to work and hope to keep me brave;
That two-score years, unfathomed, still belong
To the allotted life Thy bounty gave.

I thank Thee that the sight of sunlit lands
And dipping hills, the breath of evening grass—
That wet, dark rocks and flowers in my hands
Can give me daily gladness as I pass.

I thank Thee that I love the things of earth—
Ripe fruits and laughter, lying down to sleep,
The shine of lighted towns, the graver worth
Of beating human hearts that laugh and weep.

I thank Thee that as yet I need not know,
Yet need not fear, the mystery of the end;
But more than all, and though all these should go—
Dear Lord, this on my knees—I thank Thee for my friend.

James M. Pierce

BADGER FARMER'S MAIL BAG
FARM EXPERIENCES

Keep the Cattle Well Fed.

To the Editor:—Under the auspices of the Jefferson County Council of Defense a series of agricultural meetings are planned for this winter. The first series in November, second in December, third in January and fourth in February, with a grand round-up at the close. The first series were live stock meetings in which Professors Bullock and Negley were the principal speakers. In connection with these meetings the women's meetings were also held in which Mrs. Flagler, emergency food agent for Jefferson and Waukesha counties, took charge. The principal talks were along the lines of feeding and breeding and cow-testing work.

At this time with the high cost of feed and the shortage of labor many of the farmers in this county are up against a pretty tough proposition in order to make their feed go as far as possible and still not allow the herds to run down in production. It was one of the principal objects to show them the importance of keeping the cattle well fed even in spite of the high cost of feed at this time and Mr. Bullock talked along this line. The breeding talks were illustrated with lantern slides and an effort was made to show the importance of having pure-bred animals introduced into the county in place of many of those of poor breeding, which we have at the present time.

In connection with these meetings Mr. Negley talk d on the importance of cow-testing associations. It seems that there are none in this county, although the territory immediately surrounding us is pretty well taken care of in this line. The meetings on the whole, considering the weather, were fairly well attended. Owing to the nice weather and the ground being capable for work, farmers were busy with their fall work and the afternoon meetings suffered accordingly. The meetings held in the evenings were well attended and as a result of these meetings we probably will have three cow-testing associations under way in a very short time.

C. V. Holsinger,
Emergency Food Agent for Jefferson County.

In Brown County.

To the Editor:—The weather so far this month has been ideal for farm work. It is regular Indian summer and is enabling the farmers to get their work done, which was delayed by the cool, rainy weather in October and the heavy snow the last of the month. Farm help is scarce and the boys taken away for the army makes it hard to get along and will be something terrible the coming season.

Potatoes are a good crop and are selling for $1 per bushel. The corn crop was not very good and not many hogs were kept. Clover seed is turning out fair and there is a large acreage. Some hay has been baled and disposed of. At present it is in brisk demand at $20 to $23 per ton. Barley is $1.25 per bushel and oats, 60 cents. There was not much wheat raised. Cheese factories are paying an average net price of from $2.35 to $2.45 per hundredweight for October milk. Condenseries are paying higher. Coal is hard to get and wood is scarce, with prices high. S. J. Shannon.
Brown Co., Wisconsin.

Believes in Sheep.

To the Editor:—I read in The Wisconsin Farmer a few articles about raising sheep in north Wisconsin. I have been a sheep ranger in the West many years and bought a fine 120-acre farm in Taylor county, Wisconsin. I started in sheep four years ago and have at present ninety breeding ewes. I run them all summer on cut-over or stump land. They cut all growing brush down and kill it. They keep all weeds off the farm and do fine from it. Nothing will beat a flock of sheep to help clear land. North Wisconsin is hard to beat for raising sheep because we have green grass the year round. Clover hay and oats are all I want for feeding sheep. We never had any trouble or sickness in sheep, but don't go into the sheep business unless you are a lover of sheep.

I have just one thing against raising sheep in Wisconsin and that is that yelping, good-for-nothing, running-all-over dog. If this dog will be allowed to run in peace much longer in Wisconsin there will be 98 per cent dogs and 2 per cent sheep. Wisconsin should enact a dog law. Five dollar dog tax would be cheap when wool averages around $1 per pound. I know of a man near Dorchester who lost twenty-three sheep in one night by dogs. It was a dead loss to this man because the dog could not be found. Sheep are selling at present for $2[illegible] per head, but don't let the dogs scare you farmers in Wisconsin. Every farmer should keep from five to ten breeding ewes. It is the best paying investment.

I could write a big article about how to raise and run a bunch of sheep successfully, but a man with from five to twenty-five sheep don't need much experience handling sheep. Just help kill the dogs and the sheep will help themselves. To show how eager the farmers in Taylor county are to buy sheep, a car of sheep was sold in two hours, not advertised, for $20 per head.

Mr. Farmer, that pack of weeds on your farm and around your buildings or stump land or stony land, not good for farming, is what sheep like. It will raise you all the wool for your family and once in a while a mutton that will cost you less than pork. Try a few sheep. They will pay for the next fifteen years. E. H. Dehne.
Taylor Co., Wisconsin.

Milk Prices in Brown County.

To the Editor:—The farmers here deliver their milk to the factory at Alaska and receive the following prices per hundred pounds of milk at 35 per cent test, not figuring the whey, which is worth 20 cents per hundred: January, $2.03; February, $2.06; March, $2.03; April, $2.10; May, $2.10; June, $2.03; July, $1.825; August, $2.03; September, $2.31, and the October check we haven't got yet. As Alaska is about seven miles from Algoma, it would not be possible for the farmers to deliver their milk.

The majority of the farmers in this vicinity are investing in mill feeds and believe in feeding well at the present prices rather than let the production of milk decrease. This winter I intend to feed to my dairy cows corn fodder, alfalfa hay, timothy hay, ground oats, ground barley and oil meal. I have these feeds on hand.

If the condensery about to be located here can pay more for milk than the cheese factory under these conditions, I think the majority of the farmers would sell their milk to the condensery. Louis Stoller.
Kewaunee Co., Wisconsin.

Feeding Steers and Hogs.

To the Editor:—I will tell you something of my method of handling steers and hogs. I am not a feeder of either to a great extent—only to feed the produce of the farm, buying as little as possible.

I raise my own steer calves, being all pure-bred Red Polls, and usually sell in April or May at the age of twenty-four to thirty months. My winter feeding is largely clover hay and silage, with corn meal if the silage is deficient in nearly mature corn.

In feeding hogs they are allowed the range of clover pasture in summer with good running water. They also have skim milk and a liberal grain ration. The business of making hogs heavier, I believe, is most profitable even though corn is quite high at present. A. B. Moore.
Fond du Lac Co., Wisconsin.

Growing Corn.

To the Editor:—With relation to corn growing will mention that I have found that rolling land that faces the south makes an ideal cornfield and, as corn stands a lot of drouth, flat fields should be avoided as much as possible on account of holding water and keeping the ground cold and retarding the growth of the corn. I will mention another thing that is done and done by old farmers that I believe to be wrong. Some people in our neighborhood prepare their cornfields, making them rich with manure, and in every detail sufficient to raise a good crop of corn; they then take a horse marker and check the land for hills, making the checks about two and one-half inches deep, and the man that comes along with a planter in a hurry and sticks the planter in these check marks another two and one-half or three inches, and then the corn is down five inches below the surface of the ground and the chances are the crop is spoiled right then and there. I do not claim to be an expert in growing corn, but have had a dandy good crop every year for five seasons. This year I got 142 baskets to the acre right through of Golden Glow and Wisconsin No. 8 and have got for sale 535 bushels of ears hung up in my seed house that is dandy good seed corn. I got first blue ribbon at Shawano County Fair and got a couple down at Madison last winter and one the winter before that; besides, I got first and second this summer and last summer at the corn show held in our town.

I will mention the way I plant my corn. In the first place, it is new land farming up here in Shawano county, northern Wisconsin, and I plant about twelve acres each spring, using a horse marker, and when we come to each check mark for the hill I shove the dirt in with my foot from both sides so it is level with the surface of the ground and drop my four kernels of corn right on the spot leveled and put one inch of dirt on the corn with a hoe. It costs a little more to plant this way, as it is a little slower, but we got our money back in husking time and the people that laughed at me for planting this way don't say anything now only that I was lucky, and I guess I was, for I helped my corn by planting this way so that it was ripe by the time the big frost came on the 9th of September. Chas. Hull.
Shawano Co., Wisconsin.

What Proper Drainage Will Do.

Experience in the Belgium-Holland District, Ozaukee County, Wis.—By Margaret Bauer.

MARSH land does not produce anything, but it is taxed nevertheless. John Mueller, of Belgium, in Ozaukee county, was born and raised on the farm two miles north of Belgium. For the last twenty years at least he has been paying taxes on forty acres of marsh land which was of absolutely no value even as pasture. The assessed value of this land, while not as high as tillable farm land, was high enough to amount to $640 in taxes during this time. For this money he received nothing in return.

Corn Grown on Reclaimed Land.

About eight years ago this condition dawned upon him and several of his neighbors and they decided that as long as the land was taxable there must be some way of making it produce enough to wipe out the years of taxation and yield a good profit besides. After consulting the proper authorities they decided that a drain ditch of sufficient size to carry away the surface water could be constructed at a reasonable cost and all of the land made tillable. The project was to cost in the neighborhood of $8,000 and extend from the town of Belgium northward into the Onion river, a distance of approximately six miles. However, while those in favor of the drainage constituted a majority, a certain number of owners affected by this drain appealed the case to the supreme court and it required five years of litigation and thousands of dollars in fees until the work could be started. It was finally completed early in 1916.

After draining the land tiles were laid at an expense of another $400 and the land completely rid of the surplus water. Then commenced the work of grubbing the stumps and leveling away the excavated dirt. This year the first crop has been harvested.

Thus far only twenty acres have been put under the plow by Mr. Mueller, but from these twenty acres have come the richest harvests of corn, buckwheat, cabbage, mangels and rutabagas. The cost of the ditch was pro-rated among the thirty farmers benefiting from this ditch and Mr. Mueller's share was figured at $30 an acre. From these twenty acres he has harvested this first year $1,000 worth of crops. This is enough to pay for nearly all of the forty acres reclaimed by the ditch. Corn grew to a height of eight and nine feet on most of the farms affected by the ditch and many stands of ten and eleven feet were reported. Mr. Mueller sowed among the corn one pound of rutabaga seed, which has yielded him forty tons in roots worth now on the market $17 per ton.

The buckwheat acreage, though one-third of it was severely injured by frost, yielded a total of ninety-two bushels.

The enthusiasm of the Belgium people over the success of this drain is naturally great. It was, therefore, with a feeling of pride that they welcomed a delegation of 100 West Bend people last month who had made the trip in order to see at first hand the results of the drainage. The West Bend farmers are interested in a similar project. Mr. Lyons, of West Bend, district commissioner of the drain, and Wm. Schannen, of Port Washington, addressed the crowd and explained the condition the land was in previously.

Additional Editorial

(Continued from page 4.)

must be burned over and it may be necessary to secure special Wisconsin and Michigan legislation to properly accomplish this. Probably the work would have to be put under the direction of state fire marshals in order that it be properly controlled. Such eminent authorities as Geo. McKerrow, of Waukesha county, Wisconsin; F. R. Marshal, of the federal bureau of animal husbandry; W. B. Tyrrene and Frank J. Hagenbarth, of the National Sheep and Wool Growers' Association, believe that sheep can be handled with profit in Upper Wisconsin.

Mr. McKerrow said that he has handled all kinds of live stock in Wisconsin and that sheep more than any other class have helped him to pay for the splendid 200-acre farm he owns in Waukesha county. Furthermore, he has had Upper Wisconsin sheep experience and says that the grasses and root crops, which can be raised in that territory, will put wool and mutton on the market as cheaply as it can be done anywhere and that the quality will not be excelled by any locality in the world. Upper Wisconsin does not have the drouth and hot weather which give lambs their setback in sections further south. Clover and roots are ideal feed, but Mr. McKerrow suggests that western flockmasters coming to Upper Wisconsin will have to learn the root business, especially if they go in for early lambing, as proposed. While some talk and write enthusiastically about two to five sheep per acre in Upper Wisconsin, Mr. McKerrow says not to count on more than one the first year and two the second. There seems to be little danger of disease in Upper Wisconsin. Clover hay can be saved for the months of the year when snow is crusted over and clover hay is a balanced ration for sheep. Mr. McKerrow has fed roots for a number of years and found no bad effects and thinks that proper feeding of roots can about cut the hay ration in two. From ten to twenty tons of roots per acre can be raised in Upper Wisconsin. As a member of the live stock advisory board coöperating with the government, Mr. McKerrow strongly urges a tax of $5 to $10 put on dogs. He said they had a wolf scare at his farm not long ago and that the "wolf" cost him $1,000 in five weeks and when the "wolf" was caught it was found to be a neighbor's dog. It has been estimated by the department of agriculture that it costs $45 per year to feed a dog.

While the land men and sheep growers were in conference at Milwaukee a number of bankers were also holding a meeting to devise methods for procuring funds to finance the sheep industry.

Fertility in a Ton of Straw.

A recent issue of the Illinois Agriculturist contains a contribution by Prof. C. G. Hopkins on the manurial or fertility value of straw. It seems that a ton of straw contains about ten pounds of nitrogen, two pounds of phosphorus and twenty pounds of potassium. In addition, there is, of course, nearly 2,000 pounds of humus-making material. On the other hand, a ton of fresh farmyard manure contains ten pounds of nitrogen (the same as straw), two pounds of phosphorus and only eight pounds of potassium. Moreover, in a ton of manure there is only 500 pounds of humus-making material, as 75 per cent of manure is made up of water. According to this analysis, a ton of straw contains more fertility and more organic matter than a ton of manure, and Professor Hopkins calls attention to the fact that straw decays more slowly and its benefits are less immediate, although, on the other hand, they may be more durable.

The average man does not regard straw as having any such manurial value as is here indicated, although it is a well known fact that popularity of the plan of spreading straw on wheat fields and on meadows is increasing. Chief interest in straw centers in its use for this purpose. Four plots of wheat at the Illinois station that were covered with straw last winter gave an average yield of 46.7 bushels per acre while wheat that remained uncovered yielded 29.2 bushels per acre. Here was an increase of 17.5 bushels per acre that could be attributed wholly to an application of one ton of straw per acre.

Those who have a supply of straw on hand that cannot be used for bedding and feeding should not allow it to rot down where it now is if there is any wheat growing on the farm. If it is spread thinly at the rate of one ton per acre it will unquestionably increase the yield and, furthermore, benefit will be obtained in the crops that follow wheat, because of the nature and character of the fertility and the humus-making material contained in straw.

Wisconsin Potato Convention and Show.

(Continued from page 5.)

forty members and has been established fourteen years. The booth contained exhibits of Green Mountain, Rural New Yorker and Early Ohio varieties and also some varieties unknown to potato shows in Wisconsin, including Late Petosky, Sir Walter Raleigh, New Dearborn, Carmen and Snowflake. The association also exhibited vegetables, including onions weighing over three pounds and nineteen inches in circumferece; leeks, Chinese cabbage and Red Hollander cabbage. The exhibit did not so conform to the show program and rules as to give it a high place in the markings, but the spirit shown by the Walworth county people, and by County Agent L. L. Oldham, in endeavoring to have at least one southern county in the state represented, was noted and appreciated.

The close competition which was noted in the county exhibits contest was also apparent in the individual display. Mr. C. W. Waid, of the Michigan station, and Mr. C. L. Fitch, of the Iowa station, were judges and their work was very acceptable. Mr. Waid, though a strong booster for Michigan potatoes, congratulated the growers of Wisconsin on the splendid stock shown and also upon the spirit manifested to confine the number of varieties grown for seed and commercial purposes, and to accept only those now generally regarded as standard. As usual, there was a good display of Rural New Yorker potatoes. Mr. D. C. Hayward, of Weyauwega, won first, having a very choice display of this popular round, white variety. The other premium winners on Rural New Yorkers were Huser Bros., Grand Rapids, second; O. C. Woodard, Weyauwega, third; Peter Sandbeck, Eagle River, fourth; Charles Beard, Elcho, fifth; John F. Hauser, Bayfield, sixth, and F. S. Campbell, Three Lakes, seventh. From the fact that two out of the first three prizes went to Waupaca county it is apparent that the determination of growers in that county to stick to the one variety and constantly improve their stock, is bearing fruit. Waupaca county is one of the oldest potato counties in Wisconsin, and it now bids fair to merit the title of one of the best.

In the Green Mountain variety John F. Hauser, of Bayfield, won first as usual. It is doubtful whether there is a better grower of Green Mountain potatoes in the county than John F. Hauser. The Green Mountain potato is especially adaptable to the lake region and it is growing in popularity every year. The other prize winners on the individual exhibits of Green Mountain potatoes were Shroeder Bros., Antigo, second; Olaf Cook, Hayward, third; A. T. Johnson, Angus, Barron county, fourth; John Chelmo, Webster, Burnett county, fifth; R. H. Clark Tomahawk, Lincoln county, sixth; Herman Schoenick, Enterprise, Oneida county, seventh; John Lisk, Danbury, Burnett county, eighth.

L. N. Nelson, of Rice Lake, Barron county, had the best individual exhibit of the Irish Cobbler variety. Oscar Nelson, of Antigo, Langlade county, was second; Peter Krier, of Antigo, Langlade county, third; John Lisk, Danbury, Burnett county, fourth, and Herman Schoenick, of Enterprise, Oneida county, fifth.

Eric Mickelson, of Pembine, Marinette county, had the best individual exhibit of Triumphs. The other winners in order were J. W. Smith, Kent, Langlade county, second; Dixon Bros., Almena, Barron county, third; C. G. Kuney, Three Lakes, Oneida county, fourth; Huser Bros., Grand Rapids, Wood county, fifth, and Herman Schoenick, Enterprise, Oneida county, sixth.

Mrs. Charles Parsons, of Antigo, Langlade county, had the best individual exhibit of Burbanks. Ed Kringle, of Rice Lake, Barron county, won second prize. John F. Hauser, Bayfield, Bayfield county, third prize; Gus Kringle, Rice Lake, Barron county, fourth prize, and Charles Schotte, of Antigo, Langlade county, fifth.

The Early Ohio is becoming popular in some sections of central and Upper Wisconsin. L. S. Jacobson, of Mole Lake, Forest county, had the best individual exhibit. Charles Jewel, Rhinelander, Oneida county, was second; John F. Hauser, Bayfield, Bayfield county, third; Florence Stratton, Burlington, Walworth county, fourth, and E. K. Boiset, Lake Geneva, Walworth county, fifth.

In its business session the association reëlected by unanimous vote its present officers, J. W. Hicks, of Chippewa Falls, president; O. C. Woodard, of Weyauwega, vice president, and J. G. Milward, of Madison, secretary and treasurer. At the time this is written no definite decision has been made as to where or when the next annual meeting and show will be held. An invitation has been extended by the citizens of Milwaukee to hold the meeting there. There is a disposition on the part of some of the members to change the date of the meeting and show to the first or second week in December. Most of our potato growers reside in or near the deer territory of Wisconsin and a good many of them dislike to leave the chase in November even for such an important event as the annual potato show.

An important new line of work has been developed in connection with the Wisconsin Potato Growers' Association, coöperating with the Wisconsin Experiment Station and under the direction of Mr. T. L. Bewick. Reference is made to the boys' and girls' club work. This work extends to many departments of agriculture and live stock raising. The potato club work is only an incident in the general plan. At the potato show this year there were exhibits of stock grown by boys' and girls' clubs in Price county, Langlade county, Rusk county, Chippewa county, Waupaca county, Dane county, Rock county, Bayfield county and Portage county. In addition, there were individual exhibits. In the county class the Langlade Club won first and the Price County Club won second. In the individual classes Dawson Hauser, of Bayfield, won first on Early Rose, Triumphs and Russets. Lenhart Parsons, of Antigo, won first on Rurals; Harry Winter, of Antigo, first on Burbanks, and Ruth DeLong, of Oneida county, first on Green Mountains.

A number of notable addresses on potato subjects were heard in connection with the convention and show. These addresses were for the most part practical, but running through them all was a patriotic vein. Perhaps the subject of greatest importance before the potato growers this year is that of grading. By unanimous vote the association endorsed document No. 7 of the United States Food Administration reports. This is the government recommendations as to grading. The purpose is to cut down waste by eliminating culls from good stock. A few culls in a sack of potatoes lowers the value of the whole sack. It is the belief of the government and also of the best-informed potato growers, that the interest of all will be best served by grading. The grower will gain by reason of the fact that he will be able to get better prices for the best stock. An instance was mentioned at the convention illustrating the point. President Hicks, of the association, in company with Mr. Waid, of Michigan, visited the Chicago retail markets recently. They asked for potatoes and found the common stock with all sorts of potatoes, little and big. Alongside of this they found selected potatoes from Idaho selling at a very much higher price. Of course, we all know that just as good potatoes can be selected from Wisconsin and better than can be selected from Idaho. The Wisconsin grower is learning his lesson in this matter. There is no reason why Wisconsin potatoes should not be as well known and favorably known as Wisconsin butter, Wisconsin cheese, Wisconsin cabbage, Wisconsin onions, Wisconsin farm sausage, etc. Grading does not mean, however, that all of the small stock shall be thrown away. On the contrary, the purpose is to save the small stock and to sell it, of course, at a lower price, to those who are willing to use it. This is the way the apple growers of the country are

(Concluded on page 10.)

Be Your Own Miller

Grind your stock feed at home. Be independent of the local miller. Save the long haul to town and put the miller's profit in your pocket. You are throwing money away, if you waste your time hauling your grain to the custom mill and splitting your profit with the miller.

HOWELL *Roller Feed Mills* grind stock feed or rye and graham flour. Built on correct scientific principles. Have no buhrs or other parts to wear out. Will last a life time. Fully guaranteed. Made in 13 sizes—any capacity—a size for any engine.

FREE—Our complete catalog and the Famous Roller Mill Puzzle. Write now.

R. R. HOWELL & CO., 8 Malcolm Avenue, S. E., Minneapolis, Minnesota.

THE TUTTLE SELF-FEEDER AND SELF-THREADER

Square ends. Guaranteed. Perfect bales without the use of division board

Capacity 3 tons per hour. Self-threader saves 40 per cent of the tying work. Fully guaranteed for one year and sold on 10 days' free field trial. Time allowed on part payment, or liberal discount for cash.

TUTTLE TRACTOR CO.
1324 Ottawa St. LEAVENWORTH, KANSAS

FREE TUITION

IN REGULAR COURSES to first student from a postoffice. Study any of the following: Common School, High School, Music, Commercial, Teachers, Steam and Gas Engineering, Auto Mechanics. Correspondence courses also. Write for catalog and tell what course you want.
UNIVERSITY OF SOUTHERN MINNESOTA, Dept. F. T. Austin, Minn.

STAMMER

If you stammer attend no stammering school till you get my big new FREE book and special rate. Largest and most successful school in the world curing all forms of defective speech by advanced natural method. Write today. North-Western School for Stammerers, Inc., 2324 Grand Ave., Milwaukee, Wis.

Questions and Answers.

Noiseless Muffler.

Is there a gasoline engine muffler that is entirely noiseless without cutting down the power of the engine to any per cent?

Answer.—We do not know of any such muffler. All mufflers decrease the power obtainable from the engine to some extent. A muffler could be constructed that would be almost noiseless, but it would be too large and costly for ordinary use.

Transmission Bands Worn.

I have a new 1917 Model Ford car that I have run about 2,600 miles. I am having a little trouble with my transmission. Whenever I push the clutch, reverse or brake pedal, the transmission gives the car an awful jerky movement. Could you advise me how to overcome this? One man told me I would have to have new brake bands; another told me to tighten up the bands. I tightened them and it did some good for about 100 miles, but now it does the same thing again. I thought that the rivets that hold the bands in place came in contact with the metal so that the bands grab. It has always grabbed a little since I first had it.

Answer.—Try loosening the brake band. It may be adjusted so tight as to put a heavy load on the engine all the time. New bands will be the real solution of your problem. You might be able to drive the rivets down one-thirty-second of an inch below the face of the lining and rerivet them; also rough up the face of the lining slightly with a bastard file—just enough to remove the glaze—with good results. However, you will probably save time and trouble by putting on new linings.

A Magnetic Interrupter.

Would you please show me by a diagram how a magnetic interrupter is constructed and how it acts. How does it differ from a vibrating coil? Would the platinum points wear longer with a larger contact surface?

Answer.—The construction of a magnetic interrupter is the same as for the vibrator of a vibrating coil. Figure 1 shows the usual construction, the condenser being omitted. C is an iron core, made of soft iron wires. W

FIGURE 1.

is a coil of many turns of wire, connected to binding posts at X and Y. B is a brass block, supporting the contact screws. PP are the platinum points, S the vibrator spring and A the soft iron armature fastened to the spring. The action is as follows:

When a battery is connected to the plus and minus terminals, the current flows from the battery through the contact spring, S, to the brass block, B, and back to the battery through the coil, W. The current flowing in W makes C a magnet. C then attracts the soft steel disk, A, which pulls the contact points apart and breaks the circuit. C immediately loses its magnetism and the spring rebounds, again closing the circuit at the contact points and again magnetizing C. To prevent sparking at the points, a condenser is usually connected between X and X. In a vibrating coil, W consists of two or three layers of coarse cotton-covered copper wire, and upon this is wound many layers of fine insulated copper wire. One end of the fine wire would be connected to Y and the other end would be connected to the high-tension terminal of the coil. The larger the contact points the longer they should last, and the more they would cost.

Ammeters and Volt Meters.

How does an ammeter differ in construction from a volt meter?

Answer.—Figure 2 shows the common construction for an ammeter. A

FIGURE 2.

small ammeter is usually connected in series with the circuit so that all the current of the circuit flows through the ammeter. In Figure 2, TT are the terminal binding screws and C a coil of a coarse copper wire. A is a soft steel or permanent magnet pivoted inside the coil. When a current flows through the coil the magnet tends to place itself at right angles to the direction of the current. The pointer is fastened to the magnet, and, as it turns, the pointer moves along the scale. The more the current the farther the magnet turns.

The construction of a volt meter is very similar except that the coil of coarse copper wire is replaced by a coil of fine copper wire of many turns. The volt meter is connected across between the two wires of a circuit, and only a small part of the current passes through it. The large amount of fine wires in the coil creates magnetism with a small amount of current; and the amount of current passing through the coil is in proportion to the voltage. It is the current flowing through the coil that moves the needle, but the current depends upon the voltage.

Magneto Generators.

Why cannot a telephone generator be used for ignition purposes? Why is it that some magnetos generate a current of higher amperage than others?

Answer.—As a rule, the construction of telephone magnetos is not durable and the magneto will soon wear out if run continually. Most of them do not furnish current enough to make good ignition.

The amperage of a magneto is controlled by the size of wire used to wind the armature and the voltage. The larger the wire the greater the amperage for a given voltage. The voltage is controlled by the strength of the field magnets, the number of coils on the armature and the speed of the armature.

A Transmission With Clutches.

If an automobile transmission were driven by chain instead of gears, that is, if there were large and small sprocket wheels combined so as to make the difference in speed; and, instead of shifting gears, if there was a device to lock each sprocket wheel separately so as to engage the speed desired, would a transmission like that last longer than ordinary gears? Do you think that it would be practical and not too expensive?

Answer.—This scheme could be worked out with a fair degree of success. Automobile manufacturers have found, however, that a separate clutch for each speed is not as reliable as shifting gears, there being too many parts on the clutch to get out of order. Whether gears or chains are the more durable is still a subject for debate. The gears seem to have the better of the argument.

Motor Uses Too Much Oil.

What causes a 1917 light four Overland car to use an excess of lubricating oil? They are supposed to run 100 miles on one quart of oil, but I cannot get fifty miles on one quart. There also seems to be a loss of power.

Answer.—First, examine the bottom of the crankcase for leaks. If the oil is not leaking out the pistons probably fit the cylinders too loosely, the rings may not be a good fit, or the cylinder may be scored. This car is usually quite economical in the use of oil.

Power Required to Plow.

I am thinking of buying a Staude Make-a-Tractor attachment for Ford cars. I intend to use it for plowing in medium heavy black soil. In your opinion, how big a plow will it pull, and do you think an attachment of this sort to be practical for plowing? How many pounds drawbar does it take to pull a twelve-inch bottom in medium heavy soil six inches deep?

Answer.—You should be able to pull two twelve-inch bottoms, and probably you would have little difficulty with two fourteen-inch bottoms. The device is practical, though, of course, your Ford car could not be expected to stand up under the work of a regular tractor as well as the tractor would.

Soil such as you describe usually requires a drawbar pull of eight pounds per square inch. For a twelve-inch bottom six inches deep you have 6x12 or seventy-two square inches; 8x72 equals 576; therefore, you would have a drawbar pull of 576 pounds for one bottom, approximately.

The Use of Straw and Stover.

Practical experience as well as experimental work has taught that straw and stover can be used very economically in the ration of almost all kinds of live stock. These roughages are and should be used in the fattening rations of all farm animals except hogs, and should compose the larger part of all wintering or keeping rations for cattle, sheep and horses. Breeding herds of beef cattle or dry dairy cows can be successfully kept on rations composed largely of these materials. Flocks of breeding ewes do well with such feeds when some grain is added. Horses doing very light or no work need little grain if given a plentiful allowance of clean, bright straw or stover. Under certain conditions, of course, grain should be added to the ration, but now it should be conserved as largely as possible for human consumption.

In an experiment conducted at the Indiana Experiment Station to test the feeding value of oat straw it was found that a ration of corn silage, corn and cottonseed meal was just as valuable for economy and extent of gains when used with oat straw as when fed with clover hay. As such a ration is extensively used in various parts of the United States its practical value can readily be seen. Straw and stover are especially valuable for the wintering of breeding herds of beef cattle, and should form a large part of their feed.

Rations suitable for different classes of beef cattle are as follows:

RATIONS FOR WINTERING BREEDING COWS.

Ration 1—Straw, 10 pounds; silage, 20 pounds; cottonseed or linseed meal, 1 pounds.

Ration 2—Straw, 20 pounds; cottonseed or oil cake, 2 pounds.

Ration 3—Straw, 10 pounds; shock corn, 10 pounds; cottonseed meal or linseed meal, 1 pound.

Ration 4—Stover, 35 pounds; cottonseed or linseed oil meal, 1 pounds.

RATIONS FOR FEEDING 1,000-POUND FATTENING STEERS.

Ration 1—Straw, 5 pounds; silage, 18 pounds; corn, 12 pounds.

Ration 2—Straw, 8 pounds; legume hay, 6 pounds; cottonseed cake or linseed cake, 5 pounds.

Ration 3—Stover, 10 pounds; silage, 15 pounds; corn, 12 pounds.

Ration 4—Straw, 5 pounds; stover, 15 pounds; corn, 6 pounds; cottonseed meal, 3 pounds.

Ration for Cow Giving from 20 to 25 Pounds of 4 per cent Mil—Corn stover and straw, unlimited; clover hay, 12 pounds; corn silage, 25 pounds; cottonseed meal, 2 pounds; corn-and-cob meal, 3 pounds; gluten feed, 3 pounds.

In these rations various other feeds may be substituted. In the rations given for wintering breeding cows definite quantities of straw and stover are given. In actual feeding such figures should be somewhat disregarded and the cattle given as much roughage as they will consume.

Yearlings may be fed three-fourths the ration for breeding cows and may be expected to come through the winter in fair to good condition.

For fattening animals straw should always be within reach so that the animal may eat at will. They will usually eat from three to five pounds daily.

Complaints come to The Wisconsin Farmer from a number of our readers who say there is a shortage of stock cars. At Hillsboro, according to one subscriber, there are orders in for cars a week ahead, but the orders were not filled in sufficient quantity to take care of the shipments. There is no doubt the railroads are having some trouble on account of lack of labor and the tremendous demand for shipment of materials. However, the food situation is of great importance and every effort should be made to accommodate the shippers on time so that they will not be subjected to losses by reason of holding their cattle.

SAVE EVERY KERNEL
Your country needs every kernel of grain and every pound of meat that its farms can produce. Millions of bushels of grain are wasted annually. This waste on the average farm would feed several extra hogs, cattle or sheep—make you more money—increase food production.
SQUARE DEAL FENCE
will enable you to stop this waste — to pasture every field after harvest and save the fallen and scattered grain. It is the fence that stands tight and trim the year 'round. Has the "Square Deal" lock—looks best, lasts longest and requires fewer posts. See your Dealer about Square Deal Fence.
FREE Ropp's 1918 Calculator (50c edition) free to every landowner who sends for our Fence Catalog. Both of these money-saving books FREE.

Wisconsin Potato Convention and Show.

(Continued from page 8.)

doing. You can buy fancy, large-sized Jonathan apples in boxes at a big price. You can buy smaller Jonathan apples, all very good stock, at a less price and you can buy the smallest apples, usually in bulk, at a still lower price. All of these apples are sound,

R. H. Aishton
President North-Western Railroad.

disease-free and good, wholesome food, and by the system of grading none of the apple crop is wasted. The shipper is interested in grading potatoes for the reason that it establishes a market standard. The buyer knows what he is getting and when he ships to the market he does not run the chance of having his shipment refused that he would run with a hit-and-miss lot. Grading is expected to put the potato business on a business basis, eliminating waste, insuring fair returns to the grower and a charge to the consumer which is a fair charge for what he gets.

In his annual address Pres. J. W. Hicks spoke of the first meeting of the Wisconsin Potato Growers' Association which was held in Waupaca in November, 1912. At that time there were forty or fifty pails, boxes and sacks of potatoes, including innumerable varieties. The first extensive potato show was held in Grand Rapids in 1914, and it was an eye-opener. Since that time shows have been held at Marinette, Eau Claire and Madison. There never was a time in the history of the country when so many people were interested in potatoes. Wisconsin has just raised one of her largest crops. There will be a large acreage in potatoes next year. Mr. Hicks finds that the commercial growers are gradually improving the quality of their stock. The big, rough, coarse potato with most of the skin rubbed off in washing is now seldom seen at potato shows and the broad, shallow, uniform, clean show box has replaced the old collection of gunny sacks, tin pails, market baskets and old dirty boxes.

As in all public gatherings this year speakers before the Wisconsin Potato Convention discussed the new problems brought on us by our war. Several things seem to be important in this relation. Foremost is increased production. There are several ways to accomplish this. One is to plant more acres. Another is to take better care of the number of acres we have been planting. Another is to increase the production of potatoes in gardens. Another important factor is the elimination of waste in marketing. As good seed as may be obtainable should be placed in the hands of those who will raise potatoes in 1918. Wisconsin has a great deal of such seed; some of it now hid away in cellars and a great deal of it will eventually be passed out for potato stock. Another sidelight of great interest to the potato industry is the education of people to use more potatoes. In America we use less potatoes per capita of any people in any potato-growing country in the world. We get less out of the by-products of potatoes than almost any other potato-growing country. We waste a larger percentage of the potato than is done elsewhere. The government, through its food administration, can help us along these lines. It can help to educate the consumer to buy and use more potatoes and when this is accomplished other foods will be saved, which can be more easily shipped to our soldiers and our allies. Mr. Hoover looks to Wisconsin, as the best organized of any of the potato-growing states, to make the government's suggestions effective. In return the potato growers of Wisconsin have a right to expect of Mr. Hoover

C. W. Waid,
Of Michigan, one of the potato show judges.

and the food administration that educational food campaigns urging the use of more potatoes shall be carried on in a big way.

Our Mr. Magnus Swenson, state food administrator for Wisconsin, took a great interest in the potato show and presided at one of the convention meetings. By special proclamation he made Wednesday, November 21st, Potato Recognition Day.

One of the busiest railroad executives of the country found it worth while to spend a day at the potato show and accepted an invitation to speak. We refer to Mr. R. H. Aishton, president of the North-Western Railway. The North-Western road handles a large per cent of the potato crop shipped locally and out of Wisconsin. President Aishton urged renewed diligence in organization work to promote the potato business in this state. As the head official of a railroad covering such large area in this state, Mr. Aishton has been interested in the development of the potato industry. The North-Western road has coöperated with the organization efforts of the association and the college of agriculture and run special trains carrying the exhibits of standard varieties and also illustrations to show potato diseases and control measures. Mr. Aishton gave some very encouraging figures on the business of agriculture in Wisconsin and remarked that while he was raised in Illinois and spent most of his later life in Iowa, he still takes his hat off to Wisconsin and its people for what they have accomplished. Mr. Ashton referred to our war accomplishments also. On April 1, 1917, the strength of the Wisconsin National Guard was approximately 3,500 men. War was declared April 6th and in the early part of December when our boys went to Waco, Texas, the National Guard strength had been raised to 15,500 men and this was all done by voluntary enlistment. On April 1, 1917, Camp Douglas was in shape to provide for three regiments of infantry, while on July 15th, the date of the president's call, camp

J. G. Milward,
Secretary of the Wisconsin Association.

sites were ready, sidetracks, loading platforms, wagon roads, wells, bath houses, commissary supply houses—all were ready for the full quota of Wisconsin troops. As an example of live, business organization and execution, Mr. Aishton says that work is without parallel.

Mr. Aishton is chairman of the American Railway Association Special Committee on National Defense, or better known as the railroad's war board—hence he knows what he is talking about when he reports the wonderful work accomplished at Camp Douglas. The railroads of America, according to Mr. Aishton, are now operated practically as one system. They are handling the heaviest commercial business they ever had, including the tremendous requirements of the government and have transported a million or more men in regular troop movements. Nine hundred and ninety employes of the North-Western road have voluntarily entered military service. These men are now in France and Russia and 200 of them at Verdun.

In summarizing a great patriotic and practical address, Mr. E. S. Brigham, commissioner of agriculture for the state of Vermont, advised the potato growers of Wisconsin to plan their work for the coming year carefully and thoughtfully and to plant no more potatoes than they can well care for. The best seed obtainable should be planted and fertilizer should be extensively used. Exert every possible means to prevent disease and utilize methods which require the minimum of labor and after having secured a good crop, grade it carefully before sending it to market.

The convention and a number of Madison people and visitors listened to a masterly address by Hon. Carl S. Vrooman, assistant secretary of agriculture. Among other things Mr. Vrooman said that the war would have been over three months ago if the United States had not entered it. He scathingly rebuked the mildly patriotic. He created quite a furor by

Magnus Swenson,
Wisconsin Food Administrator.

suggesting that the atmosphere around the university was not so surcharged with patriotism as it might be.

First Prize County Exhibit at Wisconsin Potato Show.

Handling an Oat Crop.

To the Editor:—The question nowadays often arises how can the farmer grow the best oats and, while I do not pretend to know everything about it, I am willing to give you such experience as I have in this line.

In the first place, I try to keep the land in a continuous rotation and never grow oats more than twice on the same piece of land and this only in exceptional cases.

The rotation starts with a crop of clover followed by corn, then comes barley and after this, spring or winter wheat and the next year oats, when the land is again seeded with clover. Oats should be sown as early in the spring as possible providing, of course, that the ground is in good workable condition.

The fanning mill should not be spared during the time the seed oats should be cleaned and graded; in fact, a good fanning mill kept going for some time before seeding time is very beneficial to all kinds of grain and is a twin brother of fertile soil. Remember that every bushel of good, clean seed will be producing from fifteen to fifty bushels of your new crop, depending, of course, on the kind of grain grown, and if you take pride in farming, you will at least want to be able to say, "Well, my crop looks as good as my neighbor's," and if you can say it looks better, why, then it gives you a still better feeling, although you need not envy anything your neighbor has.

I never sow more than two bushels of oats per acre, seeder measure. The grain should not be cut until the kernel has taken on its natural color when it is ripe enough to cut, for the straw is liable to fool anyone depending on its color alone, especially if it is rusty. The most trouble with growing oats, however, is that too many people try to grow oats entirely on land without giving it much of any rotation. This not only wears out the land for oats, but the oats also.

While it is impossible for all people to have the same success with growing oats that I have had the last eight years, nevertheless almost everyone can do just a little better if they try and the satisfaction of it easily pays for it. I am still trying to do just a little better and feel that I will be able to do it, too. J. L. Krause.

Dodge Co., Wisconsin.

Tell what you have for sale in a little advertisement in THE FARMERS' MARKET. Does not cost much and may be worth a lot to you. Six cents a word per insertion. See page 15.

The Dairyman's Responsibility.

The call of war strikes with greater force upon dairymen than upon any other class engaged in productive labor. High prices of feed, high cost of labor and increasing expense in delivering constantly seek to reduce and to annihilate profits. Milk and its various profits are sold in small quantities to a public suffering from enormously inflated prices and which feels as a hardship any increase that a dairyman may be compelled to charge.

Temptations are numerous for dairymen or for farmer producers to vary from their usual line of procedure. Corn has been selling at $2 per bushel and more. This has caused many a man to feel that there might be more profit and less labor in husking his corn and selling at that price than in filling his silo and in selling dairy products as usual. High prices offered for all cattle on the killing market has led a great many men to sacrifice cows and young heifer stock.

The war has made very serious inroads upon dairy help. Some young employes have been drafted. Others have been tempted into factories of one kind or another. Munition makers have paid wages that are almost fabulous. Other industries have made marked increases. The employe of an American dairy farm is distinctly human and as such is ever ready to make a try for the pot of gold at the foot of the rainbow. All these things have thinned the ranks of the dairy workers as the German files at Verdun were thinned by rapid fire and shrapnel.

In the face of these things the dairyman must face his responsibility, great and grave as it is. Our nation and the individual human beings within our land must have milk and dairy products. The greatest cry for sympathy that has come from Germany as defeat becomes more and more apparent is, "We have no milk for our babies." In America we should not permit such condition to arise, but should at once determine that "in America we shall have milk for our babies." No higher and no nobler duty can be performed by our loyal and patriotic dairymen. The operation of the draft has shown us that the nation is above and superior to the individual and that the welfare of the nation must be held foremost. Purely from a national point of view, milk must be provided.

We are producing a record crop of potatoes this year, but an old saying with a slight change has it, "Man cannot live by potatoes alone." While we are increasing the potato and the bread crop we must not overlook as a nation and a state the importance of the dairy product. A shortage cannot be so easily and so quickly remedied as was the shortage in potatoes or as shall the shortage in wheat be overcome.

There is hope for the dairyman. Two-dollar corn is not to be the price when the crop of 1917 shall be marketed. The oat crop is enormous and will have a helpful effect in reducing the price of dairy feeds. There are fewer hogs in the country and fewer beef cattle on feed, both of which will tend to reduce the price that the dairyman will be required to pay for feed. With cheaper feed in sight it is essential that the dairyman feed liberally and well in order to insure himself a good production through the next winter season.

The price of milk will rise as it is rising everywhere. The public knows that dairymen are paying double for their feeds and they are willing to help bear the burden if only a plentiful supply can be depended upon.

This is a time for a dairyman to stay in his business. There is no line of production where it is more essential that the men in the ranks stay by their guns. Even though the profits may not be up to standard, there are periods of temporary depression in all lines and also a corresponding reaction when the net income will be satisfactory. It is invariably the man who stays with his business through any and all conditions and circumstances that wins the greatest success.

The Wrong System to Get Cheap Milk.

To the Editor:—There seems to have been on the part of those proposing to operate on the price of milk either a most thorough lack of real information as to conditions under which milk is produced at the present time or a fine indifference coupled with total disregard.

The dairy cow takes her first little toll of 60 per cent of a good, liberal ration, balanced, to her bodily needs. Then she gives to her liberal feeder and the world the milk that is produced by the other 40 per cent.

It matters not who you are or whence you come, you cannot fool the old cow. She requires just 100 per cent of a liberal, balanced ration, and if she does not get that even to the last ounce, her owner and the world will feel it.

The flow of milk for the winter's supply must, of course, come from the cows that are now fresh in milk or others soon to be fresh in milk. On the producing end of their business as a whole, there is not a more competent, keener line of business men than the men in the dairy business. They know how to feed, what to feed, when to feed, and also those little variations in occasionally changing the feed; how to substitute one food for another when so required by each individual cow, or to save in the cost of production.

The best thing they know is that to keep up and continue a full flow of milk from the dairy cow they must not omit for one day or one hour to feed the cow right up to the full limit of her requirements. Even one ounce short of that last 40 per cent lets off and down from full production of milk.

The dairy business is a very expensive one to enter and be successful, and it is also equally expensive to retire from, especially on short notice. The best authorities and the best breeders inform us that starting with the best grades or pure breds, such as can be usually bought as foundation stock, that "it takes nine or ten successive generations of dairy cows, using the best-producing sires obtainable, to produce dairy cows that can be depended upon to both produce and reproduce a fair percentage of dairy cattle of high dairy qualities."

It requires twenty-two long, weary years to breed nine successive generations of dairy cows, several high-priced sires, and the cost of feeding each calf up to the time when she comes into milk and profit at from twenty-two to thirty months of age.

Here is the required thing of the dairymen throughout the whole country, "Give to us, the people, the largest possible flow of milk to help out the food supply."

Never have the dairymen had a more promising or more productive selection of cows, fresh or soon to be fresh, in milk and capable of doing their part.

Ample feed is in sight and available to feed each one of those cows a liberal 100 per cent of required feed to produce and hold a full flow of milk.

Never has there been a time when the dairyman, knowing fully the needs of the present time of every ounce of milk possible, has made more careful provision and plans in his business with the determination to "do his bit" and part. Like a bolt of lightning out of a perfectly blue sky, this insidious, arbitrary, almost kaiser-like thing seems to strike right down in the dairyman's pathway and de-

The principal dairy states will waste, this winter, 3½ Billion Pounds of Milk

Simply by failing to get it; failing, too, when it would be easy to produce that increase for a world market that demands every possible ounce of food.

Surely this is not the time to overlook any opportunity for increased dairy production and profit. It is no time for waste or neglect. The bending of every effort toward bigger dairy results, for both patriotic and personal reasons, is the duty of every dairy farmer. Here is one way in which the dairy farmers of the principal dairy states could add this winter 3,600,000,000 more pounds of milk. At $3 per cwt. this would mean $108,000,000 more profit.

These are not wild figures. They represent bed-rock facts, and they mean that if all the cows in the principal dairy states were properly watered with James Drinking Cups they would add 3½ billion *more* pounds of milk to this winter's yield—milk that would be worth to the nation as a whole, and to you in part as a producer, at only $3 per hundred, more than a hundred million dollars.

A tidy sum for the dairymen of this country to think about, isn't it? A sum well worth saving in *any* year, but especially so in this period of advancing food prices, increased milk demand and costly feed.

Then there's your own question of labor, and the protection of your herd from disease, to be thought about in this great crisis. James Drinking Cups give each cow clean, safe water that no other cow has had her nose in. They do away with the hard, cold job of herding the cows out to the tank, herding them in again—chopping open the frozen tank.

There are two shortages for you to think about: The world-wide food shortage, and your own pocketbook shortage caused by your cows not getting all the water they want, *when they want it*, at the right temperature, day or night.

They will give more. All they need is the opportunity. James Drinking Cups spell that opportunity. The milk increase of the average cow will *pay for her cup* in 90 days. At the end of that time the account covering the complete installation will be *squared* as a result of increased profit, leaving you the cups for many years of money-making service, either in your present barn or when re-installed in a new one.

Do *your* part toward getting the extra millions which American dairy interests can produce by making milk out of water. Get *your* share of those dollars. It's easy to buy, easy to install and easy to operate James Drinking Cups. We've solved this great watering problem, and solved it *right*—just as we have so many other questions relating to sanitary barn equipment. Write today for booklet, "How to Make More Milk."

JAMES MANUFACTURING COMPANY
ES63 Cane Street, Fort Atkinson, Wis. Elmira, N. Y.

mand, "Give the people the largest flow of milk even to the last ounce, but do this at your risk and absolutely regardless of cost to you.

The pretext for said ruling is that "That part of the people who most need milk as a food can least afford it at a higher cost than at present." Why, if that is the real object and result wished for, why, oh why, make use of the only certain means to drive the price of milk so high that no part of the people, even millionaires, can afford milk as a food?

Supposing it costs the dairyman exactly $3 of his savings (he came by them by hard work and great self-denial) to produce 100 pounds of milk. Now you say to him, "Keep that up, so feed your cows that they will produce up to their full flow and limit and hold that flow up. But remember you can't have but $2 for your 100 pounds of milk."

The real dairyman, with real dairy cows, knows that he must feed each and all 100 per cent of a liberal ration, 60 per cent to maintain the bodily needs of the cow, 40 per cent for the production of milk, first, to produce a full flow of milk, secondly, to maintain and keep up that flow of milk.

If the dairyman risks or uses $3 of his savings to get the feed necessary to produce 100 pounds of milk and you tell him that he cannot have 1 cent of profit and but $2 of his $3 back (remember he had three perfectly good dollars in his pocket to start with), what will he do? He must do what any other business man must do—"quit business before business quits him."

The present condition under which milk must be produced absolutely compels the dairyman to either stand up firmly and throw off the shackles that have bound him or quit the business, and in doing the latter it is not a matter or question of selfish narrowness, of unpatriotism of temper, of a lack of great desire to be of use and really "do his bit" especially at the exact, present time for the good of all concerned.

It is a matter and questilon of just hard, cold, bread-and-butter business—and business self-preservation.

There is another angle to this problem. The real dairymen of this land are real lovers of their cows. It has taken them, as before stated, long, weary, expensive years to produce them. They dislike to work and plan twenty, thirty and even fifty years to get them, then throw them away just as their life's work is through, their dairy cows most valuable.

The conscientious, thoughtful dairyman is fully aware that when this price-fixing and price tinkering have been tried out and ceased and the people have bled, suffered and repented after the operating on prices, that they will want those same dairy cows back again to convert all the future abundant feed into milk, not only for the babes, but all mankind.

If compelled to quit the production of milk on account of prices being fixed at a much lower price than the average and great majority of dairymen can possibly produce milk and said milk producer still is able to keep and unwilling to actually throw away or sell his dairy cows, what will he do? Being unable to feed his cows so as to maintain the full flow of milk, every quart of which is so much needed, he will reduce the full complete ration necessary to hold the full continued flow of 100 per cent down to about 60 per cent, just the feed necessary to keep the cow in good condition. What will be the result? The result is identically the thought in mind when the question was asked, "Why, if the real purpose of price tinkering is to keep the price of milk down within reach and ability to buy, of the people who most need the milk as food, why make use of the only certain means to drive the price so high that no one can afford to buy it?"

For convenience let a daily production of 150,000,000 quarts of milk be the required amount of milk. We will assume that there are enough dairy cows fresh and soon to be fresh in milk to keep up that supply of milk for the next six months or through the winter, providing the dairymen, their owners and feeders, are not barred or hindered and compelled to withhold any part of a full ration necessary to build up and hold that flow and milk supply.

Is it not plainly to be understood that milk will be far cheaper and more easily obtained even if the most extravagant and highest prices demanded by the dairyman and milk producers are paid and the supply of milk is kept fully up to the required 150,000,000 quarts each day, than if the prices are fixed so low that dairymen are actually compelled to either throw in their time, profits and, say from 25 cents up to $1, every time they produce 100 pounds of milk in order to keep up the flow of milk, and they are finally compelled to quit producing milk?

When feed is shut off and away from these faithful servants, the dairy cows, the supply of milk must tumble and fall down, down from millions to thousands of quarts per day.

When that happens who will buy? How about the people most needing milk as a food—will it be more accessible, any cheaper when the flow and supply of milk in the land has fallen to hundreds of quarts each day instead of hundreds of millions of quarts each day?

Even if prices are so fixed as to leave it doubtful in the minds of the dairymen as to whether any profits may be had in the production of milk it is bound to react and cut off the full milk flow needed.

You know that during the past three years almost all mined metals have become very valuable and high in price. The production of all the mines in the United States and Alaska must in the aggregate foot up a nice little amount of wealth in a year. Not a large percentage of the area of Wisconsin is occupied by intensive, exclusive dairy farmers, yet Wisconsin's production of dairy products alone, in one year, exceeds in money value the whole productions of all the mines of the United States and Alaska combined.

Just now is the fitting, opportune time for you consumers to raise your voices and put your shoulders to the wheel to the end and purpose of serving those who most need milk, before, not after, too much price tinkering has been done.

Mr. Doctor, the business part of this question will reach you, too. But you know far better than others that there are thousands of families who need that there shall be a very full and large supply of milk at even a price on a parallel with other foods of equal value, and that in many of these thousands of families there are babes from one month to twelve of age that must have cow's milk and plenty of it or starve. Will you not lift up your voice to help ditch any plan or project that will surely lessen the milk supply?

Mr. Lawyer, if this is merely a matter of law, it is a mighty bad, poor law either in its demands or enforcement that will contribute directly to the death of thousands of babes and children, is it not? If one of you has a nice little fee down in a very comfortable place in your jeans pocket, and thought you might need that little fee and like to keep it just merely to uphold and boost the project to keep the price of milk too low, will you not return that fee and come over to the other side, even if you have to run your furnace or coal stove one-half speed ahead for a few weeks this winter? In part payment for your sacrifice the thought that you had perhaps aided to bring tears of joy in thousands of homes in this land in place of tears of sorrow ought to comfort you.

Having never had a real voice in making their selling prices, the old farmers and dairymen as well have long been used to digging in and out of just such trouble as this. The farmer-dairymen ought, and in due time will, have absolute justice and their rights in these matters of business the same as men in other lines of business—to have a voice in fixing the selling prices of the products of their labor and property.

One last word for the mothers in the thousands of homes that toil and labor for their little loved ones where even the very commonest necessities of life and even that little in the most stinted least amounts for food, clothing and fuel are most that is hoped for by them. Hard-working, overburdened fathers are also to be considered.

Whatever else fails to interest or touch any reader, please do not aid in any way to force and press to the lips of thousands of already overworked, overburdened mothers in this land, this last cup of deep, bitter sorrow, that in addition to all their burdens that they must hold their babes in their arms day by day and hour by hour and see them starve and die only to prove that milk is not cheaper or more accessible or available to those who most need it for food at $1 a quart than at 15 cents.

Rock Co., Wis. Owen S. Day.

Many Cows Freshening.

To the Editor:—Twenty per cent of the cows in the Scandinavia Cow-Testing Association were dry during the month of October and I am sorry to say the remainder were neglected to some extent, as their owners have been rushed laboring with the autumn harvest. Farm labor is very scarce in this locality. Our high cow for October is owned by Ed Shambeau. This cow, a grade Holstein, produced in thirty days 1,280 pounds of 5.5 per cent milk, making 70.4 pounds butter fat. Fourteen cows produced over forty pounds butter fat and three over forty-five pounds. We look forward to a large production next month, as many of our cows are freshening this month.

H. R. Brewster,
Official Tester, Scandinavia Cow-Testing Association.

Jolie Topsie De Kol, H. F. 149723

benefits, better home life. The cow-testing associations urge these things because after seeing the business side of the cow-testing work the other farm operations will come under a like scrutiny soon after. Unprofitableness of farm operations will become less and less frequent and adequate profits will begin coming in regularly instead of spasmodically.

The cow we need for profit was shown by demonstration and judging work conducted by Geo. McKerrow, of Pewaukee, veteran pioneer of Wisconsin's better agriculture. The judging was divided into men's and boys' judging work and several classes judged. The prizes for the best judging work among the men were won by the following: First, B. F. Greene, Evansville; second, A. E. Miller, Janesville; third, P. Austin, Janesville; fourth, C. A. Rice, Milton, and fifth, J. W. Jones, Milton Junction. In the boys' contest the following were the winners: First, Will Burdick; second, Clarence Kuhn; third, Geo. Babcock; fourth, Malcolm Boss; fifth, Harry Hurd. All the boys were from Milton.

E. S. Brigham, commissioner of agriculture, of Vermont, spoke on "The Milk Producer and Coöperation." According to Mr. Brigham, the feeling of indignation and wrong suffered by the producers in the past are the natural forerunners of milk strikes and agitation such as we have recently had. On the whole these have accomplished a good purpose, but the final settlement which will place the dairy industry on a stable and businesslike basis must be brought about by peaceful means, such as are under consideration at the present time. It is his belief that the entire responsibility for the country handling of milk must fall upon the dairymen themselves in order that they may dominate the industry and secure consistent and adequate prices. Without these means the milk producers' organizations will ultimately fail in protecting the interests of their members.

Mr. Brigham's plan for the successful foundation towards solving the milk problem lies in the coöperation of the dairymen of a local community to own a community milk plant. "Milk as it is drawn from the cow is no longer a marketable product in any large city," said Mr. Brigham. "The health authorities say that it must be up to a certain standard and that it must be pasteurized to make it safe. Small individual producers are at present offering small lots of a raw product to dealers who are expected in most cases to collect it from widely scattered areas to add the final processes of manufacture to satisfy health requirement, to ship it to market and do all the work of distribution. If the dealer fails to perform all these processes the producer has no market for his milk and must let it go to waste. This is a very weak position for the producer to occupy. The individual producer is practically powerless to help himself. The farmer who has thirty or forty cows may be the most efficient producer because of the personal attention he can give to his herd, but he is not the most efficient marketer. The product of the individual milk producer will make little impression in the city market, but the product of 100 producers brought together at a central plant and processed to satisfy all health requirements is a large enough unit to command attention in any market. An article to be readily marketable must be of standard quality. Our problem is to make standard dairy products a standardized commodity just as available as standard oil or any other standardized commodity the quality of which no consumer any longer doubts."

It is necessary to inform the consumer of the value of milk, according to Mr. Brigham. In New York City following increase in prices an investigation was made of 829 families in which the daily amount of milk had been reduced. Of 2,090 children under six years of age all were found to be either losing in weight or at least not gaining. Milk at 14 cents per quart is a cheap food, but the consumer must be convinced of the fact if we want to sell him more milk, according to Mr. Brigham. In the city of New York where the product of 1,000,000 cows is used annually it would be quite feasible to assess each cow $1 and to undertake a campaign of advertising for $1,000,000 and guarantee standard quality of milk in New York standard quality of milk in New York.

The producers, had there been a greater number present, would have felt that their part was taken care of on the program after hearing the speech of R. C. Reed, secretary of the Michigan Milk Producers' Association. Mr. Reed was enthusiastic for a coöperation between the farmers and the public in order to avert all controversy regarding milk prices. His work in behalf of the milk producers of Michigan has not been limited to securing the demand of his association, but it has been accompanied by pioneer work in educating press and public alike to the real reasons behind price advances. During his labors in behalf of the producers and his efforts towards coöperation with the public, Mr. Reed has been repeatedly attacked not only by the public, but also by the members of his own association. His indomitable spirit, however, has allowed no discouraging thoughts to enter his mind and he has kept right on sawing wood. At one time he told a group of city officials who were accusing him of not being in accord with his own organization the following: "You men are attacking me from in front in every way possible and you do not wish to understand that my efforts in your behalf are sincere. I want to tell you that I know there are a lot of these 'red necks' behind you, as you say tearing me up the back, but I can assure you when they get through with me they are coming after you and you better look out." The Milk Commission of Michigan will meet in Detroit next Friday, December 1st, and there will be decided the price for Michigan milk for the coming months.

The relation of the producer and consumer were discussed by C. E. Lee, assistant dairy commissioner of Wisconsin. Mr. Lee was equally emphatic in urging the greatest efforts on the part of the dairymen to get behind all moves which make for the better understanding between producer and consumer. He quoted several instances where small localities avoided much hard feeling by talking matters over and explaining to women's organizations and the local press exactly their stand, with the result that demands were granted and the public remained satisfied. Certain things are, however, or ought to be, in the opinion of Mr. Lee, reasonable and right in the demands of the consumer. Milk plants and dairy farms furnishing cities with milk ought to be open to the public the year around. Milk should be properly cared for until it is delivered either to the milk dealer or to the consumer. Cows should be healthy. Consumers should, on the other hand, pay their bills promptly, pay for all broken or lost bottles, clean and return bottles daily, properly care for milk after delivery, and, biggest and most important of all, analyze and trace to their source the articles which appear in the daily press on milk problems.

"The Law and the Milk Producer" was taken up by Assistant State Attorney-General Walter Drew in a very legal and only at times unofficial man-

A silo is a *permanent* investment, therefore purchasing a silo is not a question of paying a few dollars more or a few dollars less, but of getting a silo that is *right*—in design, in material, in construction. "Kalamazoo" is the answer. For more than twenty-seven years thousands of successful farmers in all parts of America have put their faith in

Kalamazoo TILE AND WOOD SILOS
"The World's Standard"

Last year alone upwards of *six-thousand* new purchasers of silos unanimously decided in favor of the Kalamazoo. And those who bought twenty or more years ago still swear by the Kalamazoo because time and experience have proven conclusively that Kalamazoo silos are *right*, from every standpoint. There's a big dollar's worth of *value* in every dollar of the cost whether you buy a glazed tile or a wood stave Kalamazoo.

They're built to meet the needs of farmers who know and appreciate the feeding value of ensilage and know how a silo should be built to make and preserve ensilage *right*. Kalamazoo Silos excel in design, material and workmanship—combining every desirable feature a silo should have and embodying the knowledge acquired through long experience in silo building. You can't go wrong in buying a Kalamazoo.

GLAZED TILE SILOS—"Permanent as the Pyramids"—fire-proof, frost-proof, storm-proof, moisture-proof, acid-proof, decay-proof, vermin-proof. Galvanized reinforcing. Require no paint, no upkeep expense or repairs. First cost is the last cost. Easy to build—and once built your silo problem is solved *forever*.

WOOD STAVE SILOS—Your choice of four of the best time-defying woods. Kalamazoo Silos are manufactured complete ready to set up. Quickly and easily erected by inexperienced home labor. All Kalamazoo Silos, whether wood or tile, have the famous Kalamazoo Galvanized Steel Door Frames and continuous doors which are universally recognized as the best ever designed.

Write Today for our free descriptive booklet and details of our easy payment plan. If interested in an Ensilage Cutter, ask for Kalamazoo Cutter Catalog.

KALAMAZOO TANK & SILO CO. DEPT. 238 Kalamazoo, Mich.

MILK ..... and WAR TIME

In these days of high prices for dairy products, the "poor milker" is more than ever a liability.

But before you sell the cow that is not producing well, try to improve her condition. Her milk value is much greater than her meat value.

Most poor milkers are non-productive because of some defect of health, which can be quickly remedied by intelligent treatment.

Kow-Kure is a medicine that acts quickly on the organs of digestion and milk production. Its widely known tonic and curative qualities have made it the standard cow medicine for the prevention of disease and the treatment of Abortion, Barrenness, Retained Afterbirth, Scouring, Lost Appetite and Bunches.

Give Kow-Kure a trial; it will do for you what it is doing for thousands of others. Feed dealers and druggists sell Kow-Kure; 55c and $1.10 packages. Send for free treatise, "The Home Cow Doctor."

DAIRY ASSOCIATION CO.,
Lyndonville, Vt.

Cow Waters Herself

With this wonderful new **Libbey Automatic Water Bowl.** Each bowl controls own water supply. Animal moves lever, opening water valve, when it starts to drink. Lever swings back closing valve when animal stops drinking. No float tank required. Bowls may be put at different heights or in any stall or pen. Cannot overflow; cannot get out of order; almost no water left in bowl. Most sanitary bowl ever sold. **Prevents spread of contagious diseases.** Increased milk yield quickly pays back cost. Saves labor; saves feed. Write today. If interested in Stanchions, Stalls, Carriers, etc., ask for General Catalog. Sent free.

C. A. LISBEY COMPANY
218 Marion St.

ner. Mr. Drew quoted the anti-trust law as passed by the Wisconsin legislature in 1893 and cited such facts as the attorney general's office had discovered in connection with the milk producers' associations. He proved to the audience how on a legal basis price-fixing for any commodity, whether justified or unjustified, whether high or low, was not permitted under the existing laws and gave this as the reason for the suit which was instituted by the state several months ago. The need for a change in the law was recognized by the attorney general's office long before the present controversy over milk arose. There is without doubt a justification in certain instances for price-fixing. Before such price-fixing can be legally admitted provision must be made for it by the state legislature. This will be urged at the next session to be held in January and the troubles not only of the milk producers, but also of the pea growers and many other worthy organizations will disappear when such amendments have been made to the law. Every craft has its organizations, according to Mr. Drew, and business developments within the last two years have proved that such associations must exist for the protection of an industry, for unbridled competition is ever the ruin of legitimate business men because it admits the inefficient and greedy. The remedy would lie, in the estimation of Mr. Drew, in a marketing commission. This costs money to maintain and will result in taxation. In the opinion of Mr. Drew, however, the arguments in favor of a marketing commission and a financial support are much the same as for a better quality of milk which is constantly being asked by the consumer.

What to feed during the coming winter was taken up by A. J. Glover, of Ft. Atkinson. In a clear and understandable manner he showed how to formulate a ration for the dairy herd. After discussion on the protein and carbohydrate contents of our leading concentrates and grasses he took time to work out several farm rations, balancing them properly from the feed available on the farm. Wherever advisable the purchase of additional concentrates was shown to bring a profit in increased milk production and greater health of the cows. Timothy hay, according to Mr. Glover, is of as much value in milk production as the northwest wind.

Charles L. Hill, Guernsey breeder of Rosendale, in speaking of the future of dairying in Wisconsin, called attention to the fact that the little Island of Guernsey, off the coast of England, supplies from its 15,000 acres a total

W. D. James

One of the Wisconsin speakers.

of 45,000 people. If on the same basis of agriculture as practiced on that island the 8,000,000 undeveloped acres in northern Wisconsin were farmed the products would be sufficient to support two-thirds of the present population of the United States. Mr. Hill urged better farms with less labor and shorter hours by the application of better methods to the farm. Advertised more widely dairy products will bring better prices without constant objection to an unsympathetic public.

Growing legumes for the dairy herd was discussed by Dean H. Otis, of the college of agriculture at Madison. Feed and fertilizing constituents are the benefits derived from growing leguminous crops and these, according to Mr. Otis, are of such importance that dairy farm rotations should include such crops. Revising the rotation of a farm so as to grow these crops was shown in excellent fashion by Mr. Otis on a chart which he had prepared. The elimination of the unsuitable crops and the substitution of proper crops in their place was demonstrated as entirely possible and highly profitable. Failures of alfalfa and clover crops were taken care of by substitution of other crops nearly as valuable as feed and soil builders. The mapping out of the farm and making provision for definite and systematic rotation gives the farm manager a vision of his job that projects well into the future. With this vision the farm work can be planned for years to come, enabling the owner to obtain maximum results from such cropping systems.

"Build your barn on paper first" was the advice of W. D. James, of Ft. Atkinson, who spoke on barn building and ventilation. He emphasized each of his points by quoting the problems he has helped to solve in the years of his experience with barn building. Thirty-six feet outside measurement and thirty-four feet inside width is about the best size for the modern dairy barn. Equipment installation which is necessary in the modern barn can best be made at that width and all unnecessary labor saved by proper arrangement of stalls and mangers. Plenty of light and adequate ventilation are as essential, in the estimation of Mr. James, as equipment. Of ventilation in particular Mr. James holds that its importance is not recognized as it should be. "You can make up your mind that you are paying for a ventilating system whether you install it or not," said Mr. James. "The health of your cows and the cleanliness of your barn and the grade of milk drawn in such a barn is entirely dependent upon ventilation. There are 21,000,000 dairy cows in this country today starving for want of air and water. The two things that cost the least are most lacking in the dairy barns of the United States. The first and best investment any dairy farmer can make is to invest in a ventilating system. Fresh air in the barn is going to pay for the cement floor and equipment by its benefits to the animals." According to Mr. James, it is impossible to adapt any system as the standard system for dairy barns. Each barns has its own problems. The barn successfully ventilated by one system cannot be taken as a model by some other owner who wishes to install a system himself.

Resolutions passed by the Wisconsin Dairymen's Association ask for the right of farmers' organizations to meet and determine proper prices for farm products. Governor Philipp will be asked to include in his message to the legislature which will convene in January a special request for the modification of the trust laws. Butter fat and milk products were indorsed as the great necessities of our nation to provide growth and health of our people rather than substitutes such as oleomargarine. The necessity of exempting skilled labor was also called attention to in order to bring about maximum production in 1918 in the same successful degree as during the past year.

Officers were elected for the coming two years. Geo. McKerrow, of Pewaukee, was elected president to succeed Math. Michels, of Peebles, whose term expired. Paul C. Burchard was elected secretary-treasurer of the organization.

PERFECTION MILKER

"I Milk Thirty Cows An Hour, Alone."

THAT'S what farmers who use the Perfection are saying from coast to coast.

The Perfection is the friend who comes in without grumbling or complaining and does the milking. He milks each cow carefully and quickly. He keeps the milk clean. He doesn't howl and swear at the switching of the cow's tail. His quiet businesslike ways seem to please the cow better than those of the hand milkers. With one good man he can milk 30 cows in an hour. And he never quits his job.

The Perfection milks nature's way, with a gentle suction, a spiral downward squeeze, followed by a period of complete release. The suction is adjustable to exactly suit hard or easy milking cows. The Perfection teat cup fits all sizes of teats. It is easy to clean. If your son or your hired man has been called to the colors, you will still be able to get your milking done easily, if you have the Perfection to help you. You can even increase the size of your herd, if you wish and thereby do your share in increasing the production of dairy foods of which the country really is in need.

C. F. Andrews of Richmond, Vermont, says:

"I milk 32 cows with my Perfection Milker in a satisfactory manner in about an hour. I see no change in the amount of milk we get. We have no teat or udder trouble. I know of 40 Perfections in this State, each one of which are satisfactory, and if I were to install another outfit, it would be a Perfection."

T. P. Peterson of Blooming Prairie, Minn., says:

"I use two double unit Perfection Milkers, and with them milk 27 cows in less than an hour. My cows made more butter fat per cow last year, milked with a Perfection Milker, than they ever made before. I bought another Perfection Milking Machine last fall for my other farm. I prefer the Perfection to any of the other makes that I have seen, and I believe it is easier on the cows, and the expense of keeping it in repair is very small. I am satisfied that it has no bad effect on the cows if properly operated I would not be without a Perfection Milker as long as I milk cows."

Get a Perfection Milker and increase your earning capacity. Write today for free copy of our new illustrated catalog.

VETERINARY

PROFESSIONAL Veterinary advice through this department to regular subscribers only. We do not answer veterinary inquiries for the benefit of "neighbors." Parties desiring information will be required to send their names in full with their address. No question will be answered by mail unless accompanied by a fee of one dollar. In order that correct information may be given, the symptoms should be accurately described, stating of how long standing, together with color and age of animal, and what treatment, if any, has been resorted to. Thoroughly good and reliable veterinary remedies are advertised from time to time on these pages. If they were not good and reliable they could not appear in our paper. Our readers are requested to look them over. You may find here some remedy which will exactly fit your case. All veterinary inquiries should be addressed to this office.

Ailing Animals.

Lump on Jaw.

I have a cow which has a loose lump on her jaw. The lump is hard, but is loose from the jaw. Is her milk good to use?

From the description you give, this is likely not lumpjaw, since it is a hard, loose lump, and if not large, the milk might be used without any harm. However, the proper thing to do is to have this enlargement opened, and if it contains pus or diseased tissue, have it taken out down to healthy tissue, and allow it to heal.

Bloody, Stringy Milk.

I have a seven-year-old cow that gave stringy milk out of first one and then another teat off and on most all summer. About two weeks ago when I went to milk her at night her left front teat was full of stringy milk. When I got that out it came bloody for a day or two, then cleared up. A few days later it clogged up again and when I got it open it was apparently pure blood of a very dark color. She seems to be in perfect health. Can you tell me the cause of this?

The milk from cows in this condition should not be used for human food, but can be used for calves, pigs, etc., until recovery takes place. If the affected quarter shows no inflammation, give one rounded tablespoonful of the following powder once a day for one to two months if necessary: Glauber's salts three parts, baking soda two parts, common salt one part. If the affected quarter is hot and painful and you milk blood from it apply spirits of camphor three parts, lard one part twice to three times a day. Also give internally at one dose one pound of Glauber's salts dissolved in three quarts of warm water. Then follow with the above powder and give wheat bran, two or three quarts, twice a day. Feed grain lightly.

Blackleg.

I lost four calves with blackleg and then I vaccinated the rest. In about two weeks I lost two more. Would you advise vaccinating them again? The rest seem to be all right now.

Sometimes the blackleg vaccine is too old to be potent and at other times when pellets are used they are lost out of the instrument just at the time of the injection and the animal is in fact not treated at all. You should have no further loss, but should this be the case, be sure to get fresh, reliable vaccine and treat all over again.

Canker of the Ear.

I have a good dog one year old and about four months ago he contracted a disease in his head. At times he seems to suffer very much. He will scratch himself behind the ears and rub his head on the ground. After a spell of suffering I notice bloody scales in his ears and as far back as I can see. I have doctored him some for canker ear, but it does not seem to do any good.

If your dog is affected with ordinary canker it should yield to the following treatment. Muzzle and confine the dog and cleanse the ear of all the discharge and scales with hydrogen peroxide and absorbent cotton swabs. Then dry the ears and fill the openings with a powder composed of chinosol (or aristol) fifteen grains, and boric acid one ounce. Then put on an ear cap or bandage to prevent flapping his ears. After this first treatment use nothing but the powder daily. If you should not get results it is probably parasitic canker and will require the services of a veterinarian or dog specialist.

Trained Men an Important Factor.

To the Editor:—Your invitation to express an opinion and give some points relative to whether education turns boys away from the farm is too enticing to pass up. I respect both your opinions and those of the Colwich, Kansas, gentleman, excerpts from whose interesting letter appears in the August 16th issue. I do not agree with his conclusions, however, and am not a college graduate, but have a wide acquaintance with agricultural college people.

He cites some examples from Kansas which I do not on the whole dispute, but his statement makes the Manhattan institution appear foolish. But if one stops to consider that the Kansas State Agricultural College means only about 800 or so students in actual farm courses out of nearly 3,000, the others taking arts and sciences and engineering and home economics, the percentage may look different. Further, I know for a fact that the records of the animal husbandry department at the Kansas school show fully 90 per cent of the graduates as returning to actual farming. Most of the other 10 per cent are engaged in United States Department extension work, or are teaching agriculture or doing county agent work. This is just one department, of course, but it is all I happen to know.

Yes, we agree that labor is scarce and probably will be scarcer still on the farms during war time. Is this any reason for boys to stay at home in the northern states during winter months, however, and dally around, comparatively speaking, when they might be taking intensive training for farm leadership no less important at this time than the officers' military training schools? Further, it is true beyond doubt that if we are to keep pace with food demands, and raise ten million bushels more with one million fewer men, for example, then how are we to do it except by using better seed, more careful, modern, scientific methods? The same holds true in live stock raising.

Trained brains will make lots of labor unnecessary. That must be admitted.

Now, suppose many farm college graduates do fail to go to farming? I ask you are they not going to make better use of their lives and opportunities and be broader, as a rule, and probably have larger incomes and contribute more to national service in whatever line they may be in, than if these men had never left the farm? Your correspondent fails to recognize that square pegs never fit into round holes, and maybe these men can do better away from the farm than on it after all. Who knows?

To take their places are thousands of college-trained farmers who can farm with reason and improved methods back of them. It is better that such a shift should take place, I think.

And the joke of it actually is that in the shift many town boys feel the call truly and righteously, and after a course in college, accompanied with the required farm experiences, these boys march out upon the wasted, barren places deserted by the farm-born boys, and to the surprise of everybody, make good with the "new-fangled notions."

Then, too, one must not forget that hundreds of college graduates in special farm courses take up lines of extension work and do far more good in a few months, if they are keen and sincere, than the farmer who stays at home, keeps his eager boys tied to old ruts, and refuses to listen to the renaissance in agriculture which is now upon us.

Organizers, demonstrators, lecturers, scientists, veterinarians, juvenile farm club leaders, county agents, live stock association secretaries, editors of farm journals—such important positions attract college-bred farm youths, it is true—and why?

Simply because no man can fill such jobs right until he has had more or less sound farm training and experience. But too often it needs a bit more to go with it, and that is confidence and ability to mingle with people and "talk back" with wide appreciation and understanding. Boys who quit at the district school, as a rule (not the exception), fail to shake off the bashful, hesitant, inward-thinking air of isolation which is by no means a big asset in public service work.

E. R. McIntyre.

Dairymen and cattle feeders have no better lookout from which to view their feeding operations than the silo.

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy so the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

HOLSTEIN COWS WANTED.

WANTED—Forty head of young Holstein cows; twenty extra fancy, highly-bred young grade cows, springing, and twenty head young registered cows. Must be either from dams with not less than 20 pounds or have records of not less than 20 pounds themselves. Send full particulars on whatever number you have in first letter. Jas. W. Magee, Chanute, Kan.

PRINTING.

PRINTING—Special offer: 200 noteheads, 200 envelopes and 200 cards delivered for $4.00. Samples free. Write for prices on sale catalogs. LIVE STOCK PRINTING CO., LaGrange, Ill.

FILM DEVELOPING.

ONE KODAK FILM developed and printed free. Send film and addresses of twelve kodak owners. Try us once. Russell Photo Co., Fond du Lac, Duluth, Minn.

CLOVER SEED.

WANTED—Good quality medium Red and Alsike clover seed. Send samples. Dadmun Brothers, Whitewater, Wis.

PERCHERON STALLION.

FOR SALE—Six-year-old Percheron stallion, $400. Two-year-old $300. J. Wesley Schaal, Gillett, Wisconsin.

SHEEP.

LINCOLN, Hampshire, Rambouillet, Shropshire, rams. Brogden Farm, Rush Lake, Wis.

FARM LANDS.

BE YOUR OWN BOSS—GET A FARM HOME IN RICH CORN [illegible] Line, 50 miles St. Paul-Minn. [illegible] ers all say, "I saw nothing better." You'll like this wonderfully prosperous stock and dairy region too. Rich soils, hardwood timber, plenty rainfall, healthful climate, beautiful lakes, fine schools, creameries everywhere. Prices $15 [illegible] up, improved or wild, easy terms. MAP AND LIST FREE. Baker, N-110, St. Croix Falls, Wis.

LANDOLOGY, a magazine giving the facts in regard to the land situation. Three months' subscription FREE. If for a home or as an investment you are thinking of buying good farm lands, simply write me a letter and say, "Mail me LANDOLOGY and all particulars FREE." Address Editor, Landology, Skidmore Land Co., 310 Skidmore Bldg., Marinette, Wis.

WISCONSIN LAND, just over the river from Iowa. Smooth drained land at half price: 520 A., 3 m. from Grand River, Ia., $30 per A., good [illegible] proposition. Will trade 255 A. in No. Mo., Schuyler Co., for live stock. Girton & Lyons, 705 Crocker Bldg., Des Moines, Iowa.

80 ACRES, $4,000—40 ACRES FIELD—Rich clay loam, 5 miles Centuria, Polk county, Wis. Complete buildings, fences, well, etc. New ground and very productive. See this bargain at once. Baker, C-110, St. Croix Falls, Wis.

WOULD YOU SELL YOUR FARM if you got your price? Sell direct. No commissions. Particulars free. Charles Renich, G-2, Woodstock, Illinois.

FOR SALE—Have 80 and 160-acre farms, mile from city; must sell one and will rent the other; easy terms. H. V. Peoples, Ladysmith, Wis.

A SIXTY-ACRE FARM, all fenced; fair buildings; bearing orchard, $2,800, $1,000 down, balance 5 per cent. French Rutter, Ferryville, Wis.

IF YOU WANT TO SELL or exchange your property, write me. John J. Black, 2 Main, Chippewa Falls, Wis.

WANTED—To hear from owner of farm or unimproved land for sale. O. K. Hawley, Baldwin, Wis.

80 ACRES—All tillable, improved, to be sold before January 1. Write Phil Barnes, Hancock, Wisconsin.

STOP, LISTEN! 180-acre creek farm, $3,000, terms, other farms. McGrath, Mountain View, Mo.

POULTRY AND PET STOCK.

War Time Cookbook.

Scrap your old ideas, forget your old habits. Business is not as usual, nothing is as usual. Accustomed routine has yielded to tense, quick action. The very air is vibrant with the will to do and the spirit of courageous adventure. Old grouches are forgotten and old wrongs left to right themselves; everyone is busy and most of us are happy.

The food adventure is part of the game. So scrap your old kitchen ideas, too, and adventure into the realm of food. It will be a voyage of discovery even for good cooks. There are many new things to eat, and many new ways of preparing familiar foods. The American housekeeper must now become an adept in that knowledge of foods that is the common heritage of the European peasants. They have never known the red meat diet of America, yet these hardy peasants have built American railways and dug our subways. Food prejudice should not be allowed to stand in the way. One great source of waste is the influence of custom. People are afraid to try new methods and new dishes.

The housekeeper who is young enough to learn will have some fun getting old recipes down to fighting trim. She will find her best material, however, in the recipes for war dishes that are appearing in magazines and newspapers. Most of this material is prepared by experts in colleges and experiment stations and is too valuable to throw aside.

The main point in planning a war-time cookbook is to arrange the recipes so as to be able to turn at once to the one needed. They may be kept in an indexed scrapbook, or mounted on heavy paper and arranged in a letter file. Perhaps the best advice for keeping recipes is a small filing cabinet arranged like a library card index. A small wooden box or even a pasteboard box will do for the file. The recipes can be written or pasted on cards, with a guide card carrying the index heading to separate the groups.

The headings in this war-time cookbook will be different from the familiar headings of the usual cookbook. The most important group will be meat substitutes. Here will be placed substantial dishes that furnish muscle-building food. These will include combinations of eggs, cheese, beans, nuts and meat with potatoes, rice and hominy. Other headings might be sugar-saving desserts, war breads and war cakes.

This collection should be made not as a curiosity, but as an everyday aid in solving the problem that confronts every American housekeeper and a practical help in carrying out the food pledge. The selection of recipes should be determined by the resources of the locality and the needs of the individual home.

Easy to Make up Jell-O

For making the newest things in desserts and Salads, Jell-O is being used by the best cooks as well as by women in millions of homes who do all of the work about the house as well as the cooking.

Cooks use Jell-O because it is more satisfactory than anything else for the finest desserts and salads.

Women generally use

JELL-O

first of all, because better things can be made of it, at the price, than of anything else.

In wealthy homes Jell-O is popular because it is too good to go without.

In homes of people of moderate means it is a part of the noon-day meal regularly for the reason that it costs only 10 cents and can be made up into the most delicious and beautiful desserts and other dishes by any woman, cook or no cook, even if she can only "boil water."

Jell-O is sold at the low price of 10 cents a package in all grocery stores and general stores everywhere in America. There are seven different fruit flavors, as follows: Raspberry, Strawberry, Lemon, Orange, Cherry, Peach, Chocolate.

The new Jell-O Book describes new Jell-O salads, "whips," knick-knacks, and dainties of almost unlimited variety. Recipes for every-day salads and desserts are given first place in it, and particularly the new things in fruity Jell-O desserts. A copy will be sent to you free if you will send us your name and address.

10¢ a package

THE GENESEE PURE FOOD COMPANY, Le Roy, N. Y., and Bridgeburg, Ont.

Pumpkin Canned for Pie.

Would you please publish a recipe for canning pumpkins for pie so that it will keep?—Mrs. G. L. D.

Remove the seeds of the pumpkin (or squash), pare, and cut into small cubes of uniform size. Blanch ten minutes, then plunge quickly into cold water. Place the rubbers in position, fill the jars, packing as closely as possible. Add one teaspoonful of salt to each quart of pumpkin and fill the jars with boiling water. Adjust the tops and partially tighten. Sterilize in hot water bath for one hour, then remove the jars, tighten the tops and set out of draft to cool.

Lice on House Rosebush.

I would be pleased to have you tell me what to do to get rid of little green lice or spiders on a house rosebush. —Subscriber.

A good soapsuds bath will rid your rosebush of these pests. Make the suds the same temperature as the water with which you water your plants, hold the bush over the pan of suds and wash thoroughly. The plant will not be injured in the least and you should have no more trouble with lice.

Rancid Lard.

Is there any way of sweetening rancid lard so that it may be used for cooking? Any information will be greatly appreciated.—Young Housewife.

This is a simple matter. Melt the lard and bring it to a boiling heat. Drop in two or three pieces of charcoal and boil slowly for an hour. Strain through a fine cloth. The charcoal absorbs all the impurities and the lard will be sweet and wholesome.

Set of Bags for Soldier.

To the Editor:—I am a new subscriber to your paper and am more than interested in the articles on war and soldier boys, as I have a brother in training. I have just finished a set of bags for his toilet and other articles, and, thinking others may be interested, I am glad to describe them.

I purchased one yard of twenty-seven-inch khaki cloth, from which I cut the large bag, and the smaller one or housewife is made from the left-over scraps. The straps on the housewife are of half inch elastic stitched at intervals to hold small articles in place.

Perhaps some others who have members of their family in the army would like to make bags like these as Christmas gifts, and so that it will be quite plain I am sending diagrams of each of the bags.

Mrs. F. M. Livingston.

Soldier's sewing kit or housewife. Flaps fold in and bag is rolled and tied with tape to carry in pocket or placed in pocket of larger kit or carry-all.

HANDY KIT OR CARRY-ALL.
Fold flap down, roll and tie with tape.

Corn Bread Recipe.

To the Editor:—Mrs. W. H. B. asked for a corn bread recipe and I am glad to send mine to you in the hope that she will find it what she is looking for.

Scald two and one-half cupfuls of corn meal with boiling water. When cool add one-half cupful molasses, a little salt, one large tablespoonful of lard, one-half cupful sugar, one soup bowl full of bread sponge. Mix stiff with flour and let rise like bread. Bake in a slow oven. Mrs. A. E. Cole.

THE YOUNG FOLKS.

That Wretched Old Gobbler.

When I went down to grandpa's farm
For a visit—I couldn't stay very long—
There were lots of things I wanted to do:
Now wouldn't you like to
Slide down the haystack, play in the mow,
Ride the horses, and milk the cow?
Now wouldn't you?
But I couldn't so much as climb a tree
'Thout that wretched old gobbler seeing me,
And then he would come with a gobble! and strut,
With his tail spread out, his wings in the dirt
Where he dragged them along to help out the noise.
I suppose it wouldn't have frightened boys,
But girls don't like it, I'll tell you that.
It's enough to make anyone a "fraidy cat."
One day when I went to feed the calf—
He was so funny he'd make you laugh
The way he'd knock the bucket around
And spill the milk all over the ground—
I had just poked it in through the hole in the gate
When the gobbler came. It was too late to go back,
So I went on through, lost my hat, tore my dress, too,
And then grandpa said he would get the old sinner,
He said we would have him for Thanksgiving dinner.
And I didn't feel a bit sorry. Would you? —Gertrude F. Priestley.

Wins Silver Loving Cup.

Dear Young Folks:—I have written you many other letters, but never have seen them in the paper, so I am going to try again. I am thirteen years old, and am in the eighth grade at school.

Susan asked for a brown frosting for her chocolate loaf cake. I can make one that I think she will like. It is called raisin icing. Take one cup of white sugar, three-fourths cup of cream and bring to a boil. Cook it until it forms a soft ball in water. When cooled add one cupful of chopped raisins and one-half cupful of walnuts.

I won the spelling contest in October and will get a silver loving cup for a prize.

I send my love to all the young folks.
Annie.

Helped Father Pick Corn.

Dear Young Folks:—I am a boy eight years old and will be nine the 7th of January. I am in the fifth and sixth grades at school.

I live on a 100-acre farm and have two pets, a colt, born this spring, and a cat. The colt's name is Tommy and the cat's name is Tip. Papa is weaning my colt. When I whistle to him he will come right up to me and he will not kick or bite. When I tell Tip to scratch me he will lick with his tongue, and when I tell him to lick he will stop.

Papa has thirty little pigs. This fall my brother and I helped papa pick corn. Raymond.

Made Pet of a Rain Crow.

Dear Young Folks:—I am nine years old and am in the fourth grade at school.

I will tell you about a pet bird we had about two years ago. One morning after a rain storm my brother found a bird on the ground. It was very little and could not fly. After it grew larger it made so much noise that we named it Screecher. After it grew older we found that our pet was a rain crow. One day when it was just learning to fly we fed it a blackberry and the next morning it was dead.

I think the answer to Susan's riddle —what goes up when the rain comes down?—is a parasol. Vivian.

Learns Her Lessons at Home.

Dear Young Folks:—I am a little girl seven years old, but I have never gone to school. I take my lessons at home, and also take music. I have a little brother six months old and he is the best baby I ever saw.

I always read the Young Folks page and enjoy it very much.

We live on a farm and I have two kittens. Mamma has about forty chickens.

I send my love to all the girls and boys. Genevieve.

Lives With Grandma.

Dear Young Folks:—This is my first letter to you. I am a little girl eleven years old. I live on a ninety-five-acre farm with my grandparents. My mother is dead and I do not know where my papa is.

I go to school a mile away. I am in the sixth grade. Twelve children go to our school. The name of the school is "Scotland."

Grandpa is building a washhouse. Grandma washes with an engine.

I am going to ask a riddle. A marble wall as white as milk, a curtain drawn as soft as silk; there came a thief and broke the wall and there appeared a golden ball. Can you guess my riddle? Hazel.

Uncle Sam Should Be Proud of Her.

Dear Young Folks.—I read your letters all the time and I think they are very interesting. I am ten years old and am in the fifth grade. My father owns a farm. I have two brothers, one sixteen and one six. I go to Sunday school every Sunday.

I own a liberty bond and I am a member of the Red Cross. I also gave a dollar to the Y. M. C. A.

I am sending a recipe for a scriptural cake. Four and one-half cups of I Kings 4:22; one and one-half cups of Judges 5:25 (last clause); two teacups of Jeremiah 6:20 (sugar); two cups of I Samuel 30:12 (raisins); two cups of Nahum 3:12; one cup of Numbers 17:8; two teaspoons of I Samuel 14:25; season to taste with II Chronicles 9:9; six of Jeremiah 17:11; a pinch of Leviticus 2:13; one-half cup of Judges 4:19 (last clause); two teaspoons of Amos 4:5 (baking powder). Dorothy.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Enclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date fall and winter 1917-1918 catalog, containing 850 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating thirty of the various simple stitches), all valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

1924—Children's dress in empire style and with long or short sleeve. The pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 3⅛ yards of 44-inch material for a 6-year size. Price, 10 cents.

2009—A comfortable and an attractive lounging robe. The pattern has 4 sizes: 34, 38, 42 and 46 inches bust measure. It requires 6⅝ yards of 44-inch material for a 34-inch size. Price, 10 cents.

Waist 2037-Skirt 2060—A pleasing dress for home, business or calling. The waist is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 3 yards of 44-inch material for a 36-inch size. For the skirt of the same width material, 4⅜ yards will be required. Skirt 2060 is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. Two separate patterns, 10 cents for each pattern.

2048—Ladies' camisole. The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 1⅝ yards of 36-inch material for a 38-inch size. Price, 10 cents.

2132—Ladis' "cover all" apron. The pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42, and extra large, 44 and 46 inches bust measure. It requires 4⅞ yards of 36-inch material for a medium size. Price, 10 cents.

Coat Waist 2184-Skirt 2187—A charming three-piece suit. Pattern 2184 furnishes the coat blouse and waist, and 2187 the skirt. The waist and coat blouse are cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 2⅜ yards of 36-inch material for the waist and 3⅜ yards for the blouse, for a 36-inch size. The skirt is cut in 7 sizes also: 22, 24, 26, 28, 30, 32 and 34 inches waist measure, and requires 3⅜ yards of 36-inch material for a 24-inch size. Two separate patterns, 10 cents for each pattern.

2295—A smart suit for boys. This pattern is cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 requires 3⅛ yards of 44-inch material. Price, 10 cents.

2304—Dress for misses and small women. This pattern is cut in 3 sizes: 16, 18 and 20 years. Size 16 requires 4¾ yards of 44-inch material for the dress and 1¾ yards for the jumper. Price, 10 cents.

2309—A stylish and unique design. The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6½ yards of 44-inch material for a 36-inch size. Price, 10 cents.

2311—A smart dress for the growing girl. The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 will require 3½ yards of 44-inch material. Price, 10 cents.

2314—A popular, practical garment. The pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. Size 12 requires 4 yards of 44-inch material. Price, 10 cents.

2318—A popular, up-to-date style. The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 5⅝ yards of 44-inch material. Price, 10 cents.

Recipes.

Tomato and Cheese Rarebit.—Two tablespoons fat, two tablespoons flour, three-fourths cup milk, three-fourths cup stewed and strained tomatoes, one-eighth teaspoon soda, two cups finely cut cheese, one egg, slightly beaten, salt, mustard, cayenne. Melt fat, add flour and milk gradually. As soon as mixture thickens add tomatoes mixed with soda; then add cheese, egg, and seasonings to taste. Serve as soon as cheese has melted, on rye toast.

War Pumpkin Pie—One cup molasses, one quart cooked pumpkin, grated peel of one lemon, one-half teaspoon each of nutmeg, cloves and cinnamon, four eggs. Heat the molasses and stir into the pumpkin; add the seasoning and beaten yolks of the eggs. Mix well; add the stiffly beaten whites of the eggs. Bake in a pudding dish and serve cold.

Braised Beef.—Three pounds beef from lower part of round or rump, two tablespoons fat, one-half teaspoon peppercorns, three cloves, one-fourth cup each of carrot, turnip, celery and onion, cut in dice, salt and pepper. Wipe meat, sprinkle with salt and pepper, dredge with barley flour and brown entire surface in fat. Place on rack in deep granite pan or in earthen pudding dish, and surround with vegetables, peppercorns and three cups of boiling water. Cover closely and bake four hours in very slow oven. Baste every half hour and turn after second hour. Throughout the cooking the liquid should be kept below the boiling point. Serve with horseradish sauce or with brown sauce made from liquor in pan.

Barley Drop Molasses Cookies.—One-fourth cup shortening, one-fourth cup sugar, one-half cup molasses, one egg (beaten light), one-half cup thick sour milk, one cup wheat flour, one-half cup barley flour, one teaspoon soda, one-half teaspoon salt, one teaspoon ginger, one-half teaspoon cinnamon. Cream shortening, beat in sugar, then add other ingredients. Drop by spoonfuls on buttered tins. Bake in quick oven.

Dark Cake.—One-half cup butter and lard mixed or all lard, one cup light brown sugar, one cup buttermilk, two cups flour, one tablespoon cocoa, one teaspoon each of cinnamon, soda, baking powder, one-half teaspoon nutmeg, and one-half teaspoon salt if all lard is used. Walnuts, citron, raisins or English walnuts make this cake nice enough for a Christmas cake. You can use two eggs, or it can be made without any.—Mrs. W. J. Sayers.

International Sunday School Lesson.

Lesson for December 2, 1917.

Nehemiah Builds the Wall of Jerusalem

LESSON TEXT—Nehemiah 4:7-21.

GOLDEN TEXT—The Lord is my Helper and I will not fear what man shall do unto me.—Hebrews 13:6.

The lesson of November 18th spoke of Nehemiah journeying to Jerusalem. After his arrival he spent three days in looking over the work; then he told the priests and other leaders his plans. Enthusiasm was awakened, all classes were aroused, the work of the building of the wall of the city was apportioned among the people, and soon half of the wall was completed "for the people had a mind to work."

I. The Wrath of the Enemy, vv. 7-9. The progress of the work kept up the anger of Sanballat the Horonite and his friends who formed an alliance to hinder the wall being built (vv. 7, 8). When God begins to work through his people, Satan is aroused and tries to interfere. It is no sign that a Christian is out of the will of God when opposition is felt. The enemy will always be on hand to try to hinder whenever a real work for God is going forward. Dead formal Christianity runs smoothly and with deadly monotony and Satan lets it alone, but as soon as some results of real work are seen, opposition is at once felt. Thus it was when God sent His Son into the world, and so it has been in every movement for God in the church, and so it will be in the individual Christian life. From the next verse (9) we would almost think that Nehemiah had heard our Lord's injunction to "watch and pray." Many do much watching and fail; many do much praying and fail; but none ever turns to watching and praying without finding victory. Prayer alone means sloth; watching alone means pride; but watching and praying victory.

II. Internal Opposition, vv. 10-14. Sanballat and his friends were not the only ones Nehemiah had to contend with. Among those that worked on the wall were some shirkers and grumblers. They had become discouraged in the work and began to say they could never complete it (v. 10). If Satan fails to hinder the work from the outside, he will attempt to create dissatisfaction on the inside. Internal confusion of the church is more to be dreaded than open opposition from a known enemy. Dissension and confusion in the church can usually be traced to workers becoming discouraged. The plot of the enemy to make a surprise attack was discovered by the Jews who lived outside the city. They reported it not once, but ten times, with the suggestion that the work on the wall be stopped, and safety sought by leaving the city altogether (vv. 11, 12). When the enemy's open opposition fails and discouragement has been tried, an attempt is made to bring fear upon the workers. But the Bible is full of exhortations for Christians to "fear not." Could these workers on the walls of Jerusalem have seen the unseen, it would have made little difference to them whether the enemies were numbered by tens or thousands, and could Christians today realize that God is for them, all opposition would be as nothing. (I Cor. 10:13; Rom. 8:31; Phil. 4:13). Nehemiah at once proceeded to allay the fears (13, 14). Armed forces were arranged about the walls to guard against the reported surprise attack. The warriors were placed so that in the event of battle they would be protecting their own particular families. Then Nehemiah made a short speech of encouragement to the people, the heart of which was "Remember the Lord which is great and terrible." Remembering him would drive the fear away. They who are on the Lord's side are already victors even before the battle has begun. Someone said to a great general before a certain battle began: "I hope the Lord is on our side." The reply was: "I trust we are on the Lord's side." When this is true, there need be no fear whether the enemies be few or many. Nehemiah then exhorted them to fight for their families and their homes. This two-fold secret of the victory is presented to us over and over in this book of Nehemiah, and nowhere is so prominent as in this lesson. Victory for the Christian depends on two things: We must trust in the Lord as though all depended on him, and we must work and fight as though all depended on us. This is the secret of the success of Nehemiah.

III. The Progress of the Work, (vv. 15-21). The speech of Nehemiah having quieted the fears of the people and the enemy having heard that their plans were known and that God had brought their counsel to naught, all the people returned to the work with renewed enthusiasm and purpose (15). There was a rearrangement of forces (16-21). Half of the people worked; half, full armed, stood guard. A trumpeter was beside Nehemiah, so that at the first alarm from outside all the workers and warriors could be called to the threatened spot. Then they went ahead with building the wall.

What 15c Will Bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve-center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of **15c** in stamps or coin will bring you the Pathfinder **13** weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 25th year. This paper is the kind that is tempting the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send **15c** to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us; we are glad to invest in new friends.

POULTRY DEPARTMENT

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning disease, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Horse Sense in the Poultry Business.

To the Editor:—I was very much pleased with the article in your paper recently entitled the "Farmer and the Fancier" and, while I agree with the writer in general, there are some things in it that do not agree with my experience, and I have handled chickens, more or less, for sixty years, having had my first experience when about twelve years old, although I had pet chickens when only eight years old. I always liked chickens, and it seems to me that we had some good chickens long before there was such a thing as a book entitled "American Standard of Perfection." I believe that the first edition was printed and issued in February, 1874. I have a copy of the above book and, while I can say that it is all right as far as giving us disqualifications, defects and the perfect points of the breeds mentioned therein, I have yet to find where it gives any instructions to enable a breeder to mate so as to get the best results. It tells us what is perfect in color, shape, etc., but it does not tell us how to overcome some of the defects that are sometimes found in pure-bred fowls. I am aware that there are some who hold that if we mate only those that are given as perfect in the Standard that we shall surely have good results, but often we do not have good results, and here is where an article written sometimes by a poultry editor does more to help the beginner than does the Standard.

It is possible that a bird may be pure bred and yet have a feather on its shank occasionally. I have known cases where Barred Plymouth Rock breeders have kept the very best birds for years, and yet once in a while they would find a feather cropping out on the shanks. In one case a man pulled out the stub, as he wanted to show that bird, because it was almost perfect otherwise, and when the judge picked up the bird in the show room he noticed where the stub had been pulled and said to the exhibitor, "You did a good job, but not good enough to deceive me," and he disqualified the bird from the show. That bird turned out to be one of the best layers that the man owned, but, of course, would not do to breed from on account of that stub. If the Standard of Perfection were blotted out I do not think that the poultry business would go to the "bow wows," as we had some fine poultry before the Standard existed. I well remember having a Shanghai cock bird, weighing twelve pounds, long before the Standard existed. And we had Dominicks, Crested Polish and many others that were considered good birds at that time and did well in laying, but they were not cared for in those days as they are now. Neither were cattle and horses cared for then as now, and all honor to the men that have done so much to advance the live stock interest to the farmers and others. I know that those men sent out by our colleges have done worlds of good for the farmers and others, yet sometimes those parties meet their equals in men who have made a success in farming. True, today we have boys who are better qualified to run a farm than are their fathers, and all on account of the instruction they have received from our agricultural colleges. You cannot teach an old dog new tricks, and that is the reason so many elderly men will not heed the advice of the younger generation, but I am leaving my subject and must get back to it.

If our Standard of Perfection had something in it in regard to diseases of poultry and some of the remedies it would be worth a great deal more to the poultryman than it is at present, and I also think that the book could be sold at a much lower figure than it now is.

Thirteen years ago I concluded to go into the poultry business as a pastime, and I concluded to try the Rose Comb Rhode Island Reds, as they were said to be a coming bird. I purchased some pullets from a prominent breeder who had fine layers and I was careful to see that they had a fair test. I fed them well and kept an account of all receipts and expenditures and I have found that they have always paid well for their keep. However, in the meantime, I have tried out some other varieties to see how they compared with the Reds. I tried Barred and Buff Rocks, Brown Leghorns, Buff White and Black Orpingtons, Black Langshans and Rose Comb White Minorcas, and I discarded all and kept Reds all through the thirteen years. I never tried any of the Wyandottes until this year, and I am well pleased with them. Last fall while visiting a friend I saw some fine White Wyandottes around a farm home and on inquiry I found them to be the J. C. Fishel strain and I purchased eight fine pullets and mated them to a fine one-year-old cock and I have some fine chickens from the mating.

I have both Red and White pullets that have been laying over two weeks and they were hatched about the last of March. Thus far the Whites are holding their own with the Reds and it looks to me as though I have as good Whites as I have Reds.

There is one thing I have found necessary to good laying, and that is good care and feeding. I have found that hens cannot roost on barbed wire fences during winter, eat snow for their drink and furnish eggs to pay for their keep. Farmers do not need to pay fanciers such high prices for male birds, as they can raise them themselves, or purchase the same from some progressive farmer and they will often find that the birds from the farmer are healthier and better than those from the fancier. I know whereof I speak, as I have tried it. I have line bred my birds and when I wanted to introduce some new blood I purchased a male from a line of good layers and then kept track of the chicks from the new bird to see how the new blood worked. I have observed that Rose Comb birds sometimes throw Single Combs, and those birds are generally the finest kind. I once received a letter from a gentleman asking me if I had any Single Comb birds and I told him that I had four pullets and a cockerel of that kind, but that they were sports from Rose Comb. He ordered those birds and he wrote me afterward that he never had better layers than they were. He told me that they bred nearly all single comb chicks. It is no trouble for a farmer to raise his own male birds if he would only have one or two pens for breeding purposes. Let him pick out about two dozen of his best females and pen them up with good male birds and he would get enough eggs from them for incubating purposes. Some farmers do this and it saves them money and they have as good, and oftentimes better, than they receive from the fancier. When I see the prices that are often paid for cocks and cockerels it comes to my mind that it does not pay the purchaser, but it does the seller. I never show any birds at the poultry shows, as it does not pay to take the chances of having your birds take cold and die, and in some cases they catch some disease that ruins them for breeding purposes. I would say, however, that I have furnished winning birds to parties that have shown them at the Des Moines Poultry Show and also at the state fair in that city. Horse sense is one of the things essential to the success of the poultry breeder, as it is in many other things.

James Lawrey.

Seed Corn

HIGH GERMINATING, northwestern Iowa grown, 1916 crop. Reid's Yellow Dent, Dakota Gold Mine, Wimple's Yellow Dent, Silver King, Pride of North and Minn. No. 13. Price $6 per bushel. Guaranteed to please. Seed corn situation is serious. Order early.

OUR LEGAL DEPARTMENT

THIS department is edited by a practicing lawyer, who has had years of experience at the bar. He will give accurate and reliable answers to all legal questions when they are of sufficient importance to be of practical interest to any considerable number of our readers. Subscribers who desire questions answered in this department should base them upon a brief, plain, concise statement of the actual facts. To insure immediate attention inquiries should be addressed to "The Legal Department," in care of this paper; but as the inquiries sent are at times very numerous, thus delaying printed answers, those to whom it is important to receive an immediate reply by mail should remit $1.00, addressed as above.

Law Questions.

Federal Tax Law.

A Subscriber, South Dakota.—(1) Under the new federal tax law, is a widower who has children, classed as a married or single person? (2) A farmer sold produce for $1,350. His family expenses are $500 and his hired help $150. What is his income for taxable purposes? (3) A farmer sells produce for $3,130, but pays out $1,200 for rent of place. What is his income for taxable purposes?

Answer.—(1) He is classed as unmarried. (2) In such a case there is no taxable income. (3) In such a case there is no taxable income if the farmer is a married man.

Will—Children Not Mentioned.

A Subscriber, Arpin, Wis.—A man having a wife and children died in Wisconsin. He left a will, but did not mention his children in the will, and gave all his property to his wife. His children did not sign away any of their rights and their mother has sold the property. Have the children any lawful claim on their father's estate?

Answer.—If the maker of the will intentionally omitted to mention his children they cannot get any share of his estate, but if such omission was by mistake or not intentional they can get their share as though no will had been made.

Personal Injury on Ranch.

A Subscriber, Mitchell, S. D.—A big ranch in South Dakota, containing from 1,600 to 2,000 acres of land, is operated entirely by hired men, who work by the year, at so much per month, and board themselves. While working on the ranch, one of the hired men was hurt. Can he recover compensation or damages for his injuries from the owners of the ranch?

Answer.—If the injured man can prove that he was hurt by reason of the negligence or carelessness of the ranch owners in providing defective machinery or equipment, he can sue them and recover damages for his injuries; otherwise, he cannot hold them responsible.

Doctor's Charges.

A Wisconsin Subscriber.—When a doctor is called to attend a case of childbirth, and circumcises the child at the request of its parents, can the doctor lawfully charge extra for performing the circumcision, or does it go in with his services at the birth?

Answer.—The doctor can lawfully charge for the operation of circumcision. It is not included in the services of the doctor at childbirth.

Husband and Wife—Mortgage.

A Subscriber, Graettinger, Iowa.—My father and mother own 160 acres of land in Emmet county, Iowa, by a deed which conveys eighty acres to father and eighty acres to mother. There is a $4,000 mortgage on the land, payable next June. Each one of my parents stands half of the mortgage. There are eight children in the family, the youngest being ten years old. Father walked away and has been gone more than three years, and is living with my brother-in-law. (1) How much of father's share of the farm is my mother allowed and can the matter be settled without going to court with it? (2) If father does not return to settle the mortgage next June, or renew same, what will happen?

Answer.—(1) Your mother is not entitled to any share in your father's part of the farm while he is alive. She already has half of it by the deed. If he should die she would be entitled to one-third part of his half and it would then have to be settled in court. (2) If the mortgage is not paid when due the holder of it may foreclose and have the whole farm sold to pay off the mortgage.

WHERE FEED COSTS LESS Producing grain crops and stock feed at low cost—that is the secret of big profits in farming today. **Here is your chance:** You can buy, at low prices and on very easy terms, a new farm ready to clear, plow and plant in the

HIGHLANDS OF LOUISIANA

a natural corn country, and where live stock can be fed and fattened at about half the cost of feeding in Northern states. The Highlands are high, rolling, naturally drained; the climate healthful; ample rainfall, mild winters, a long growing season, open pasture seven to nine months each year. Investigate for yourself. Get the new, illustrated book of facts—

NEWS OF THE SALE RING

Waukesha Holstein Sale.

The Waukesha County Holstein Breeders' Association sale held November 16th at Waukesha was the best fall sale that has been conducted by this association. The first 27 head sold averaged $310. When 55 head had been led through the ring the average was still $310 and when 61 head were sold, the average was $312. No exceedingly high prices were reached, but with few exceptions, the prices for most of the animals consigned were very good. Fred Pabst topped the sale with his 31-pound bull calf which sold for $1,000 to John Brickhane, Elkhart Lake, Wis. Bert Baird's 28-pound cow that has a 910-pound semiofficial yearly record topped the prices paid for females by bringing $800. Aitken Bros., Waukesha, bought her, as well as a number of the other top notchers of the sale. Aitken Bros. are assembling a very high-class herd and should have one of the leading Holstein herds in Waukesha county within a few years. Baird Bros. sold the next highest priced cow in the sale for $700, that went to Frank J. Neimer, Cassville, Wis. D. J. Howell, A. P. Kaye and H. E. Reddelien also consigned some of the choicest cows of the sale. The Carnation Stock Farm sold seven head for an average of $418, including the second highest priced animal of the sale. Their 26-pound son of Johanna McKinley Segis brought $825. There were buyers from a number of the surrounding states, but practically all of the best stuff remained in Wisconsin. The following is a list of sales:

BULLS.

Carnation Segis Ormsby, Dec., 1916; J. F. Jelka, Dundee, Ill. $825
Korndyke Rag Apple Milla, April, 1915; Milan W. DeMerit, Lake Mills, Wis. 320
Carnation Fayne Colantha, Dec., 1915; C. S. Conger, Carmi, Ill. 450
Bairdland Sir Creamelle Segis, Feb., 1917; John Hardy, Pewaukee, Wis. 365
Ormsby Appoline Prince, March, 1916; Theo. Mentgeo, Withee, Wis. 200
———, Jan., 1917; O. H. Brown, New Richmond, Wis. 195

Cow-Testing Reports.

Value of Good Cows Advances.

To the Editor:—Four hundred twenty-three cows were tested this month and out of this number sixteen were selected to serve in the army of forty-pounds fat producers. This is the smallest number of forty-pound cows that the association has had since it was organized in March, 1916. Unfavorable weather conditions combined with the small amount of grain fed by some of the farmers is one of the reasons

Two more pure-bred sires were placed at the head of two herds this month, one of these replaced a scrub sire that for the poor production this month. was formerly used before the association was started. Eight unprofitable cows were detected and sentenced to the stockyards where they will do more good as "canners" than "producers." Embrat, a grade Holstein cow owned by Ole P. Dobbe, Rosholt, produced 1,354 pounds of milk and 50.1 pounds butter fat, this being the largest individual production from one cow.

The honors for high herd average goes to Alfred Brekke, Galloway. His herd of ten Holsteins averaged 825 pounds milk and 33.3 pounds butter fat per cow. Mr. M. J. Bestul's herd of Holsteins gave Mr. Brekke's herd a merry chase with an average of 810 pounds milk and 32.3 pounds butter fat per cow. The leading Guernsey herd this month is owned by Carl Faldet, Iola. His fourteen Guernsey cows had an average of 586 pounds milk and 31.4 pounds butter fat.

Grade cows in the association are selling for $125 to $200 per head and before the association started $100 to $130 per head was considered a good price. The forty-five-pound list for the thirty-day period ending November 4th is as follows:

Owner, name and breed.	Age.	When fresh.	Lbs. milk.	P.C. fat.	Lbs. b'fat.
Carl Faldet					
Trixy, G. G.	6	7-1-17	791	5.9	46.7
C. E. Ericksen					
Whiteface, G. G.	9	3-3-17	1000	4.6	46.0

In Dodge County.

To the Editor:—Following is the forty-five-pound list of the Dodge County Cow-Testing Association for the thirty-day period ending October 19, 1917:

Owner, name and breed.	Age.	When fresh.	Lbs. milk.	P.C. fat.	Lbs. b'fat.
Frank Bogda					
Black Beauty, G. H.	6	8-4-17	935	5.7	53.3
C. Zimmerman					
Nichtern, G. H.	6	9-24-17	943	5.1	48.1

J. C. KELLETT, Official Tester.

The Alma Association.

To the Editor:—The highest producing cow for the month of October, in the Alma Association, Buffalo county, Wis., is owned by F. B. Joos. She is a pure-bred Jersey and her production for thirty days was 852 pounds of milk and 59.6 pounds of butter fat. In October F. Hohenstein's herd of fourteen cows averaged 966 pounds of milk and 38.5 pounds of butter fat. Mr. Hohenstein's registered Holstein bull is out of dam with A. R. O. record of 715 pounds of butter fat and 17,000 pounds of milk. The forty-five-pound records for October follow:

Owner, name and breed.	Age.	When fresh.	Lbs. milk.	P.C. fat.	Lbs. b'fat.
E. Hawley					
Molly, G. G.	7	4-6-17	1104	4.1	45.2

Juty, G. H.	1200	3.9	46.8
Lina, G. H.	873	5.2	45.3

G. A. DEEDON, Official Tester.

America Needs More Horses

The American Red Star Animal Relief, whose headquarters are at Albany, N. Y., calls the attention of the American people, and especially of those engaged in agriculture, to the necessity for conserving army-type horses throughout the country. Enormous demand will be made upon the American people before the war is brought to a finish.

Many military experts, including cavalry officers of high command, declare it is more than possible that the horse may be the determining factor in the war. The transport of food to the trenches, the supply of ammunition for the guns, the rapid movement of artillery—these are duties which only the horse can perform. And if open fighting should develop, as it may in some desperate effort to force a final issue, there will be terrific slaughter of cavalrymen and horses.

Europe's horse supply, with the sole exception of Russia, which has enormous resources, has already been sorely taxed. Britain, France and Italy have been buying from outside sources since the war broke out. Canada has furnished enough horses for her own army of half a million, with the prospect of just being able to supply the needed reënforcements as required to make good her casualties. The allied nations are looking to America as their main hope in the matter of horse supplies.

The importance of the horse may be judged from the following facts:

There are 4,500,000 horses engaged in this war.

On the western front the losses over a considerable period averaged 47,000 horses a month.

In eight hours' fighting along a three-mile front at Verdun the French lost 5,011 horses.

Over a million and a half of America's horses have been purchased for service with the allies.

In the first seven months of 1917 the value of horses shipped to Europe from American ports was $25,327,333.

For the month of July alone the value was $1,377,202.

When the American army goes to take its place in force on the battle field next spring it will req ire 400,000 horses for the fighting equipment of a million men. Every month the losses will have to be made good, which means that constant drafts will have to be sent to Europe, to take the place of those animals killed in action, dying from diseases, or lost by submarine attack. America has approximately 22,000,000 horses, but less than one-fifth of these are available for war service. Already there is a decided shortage of the best type of cavalry remount.

Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

Grant County, Wis., Duroc Jersey Breeders' Association.

ON November 16th the breders of Durocs in Grant county met and formed a county association to further the advancement of their chosen breed. We believe there are breeders in Grant county that will eventually be contenders for first place among the state's leading breeders. The association was started with 30 members and the "live wires" of the county are at the "helm." Arthur McKivitt, of the firm of McKivitt Bros., was chosen president. No better stockmen can be found in the state than the McKivitts, and the breeders showed judgment in placing him at the head. Roy Horsfall as vice president is worthy of this honor. He is getting a good herd together and in time we hope to see him at the big shows. In selecting W. C. Edge for secretary-treasurer they picked one of the best hog feeders in the state. Mr. Edge has only been in the pure-bred business about two years and he has "come fast." Take at tip and keep your eye on the "Edge Durocs." We predict champions will come from this herd. J. L. Ervine, J. E. Foster, I. L. Runde and A. S. Huff are directors and they will have their shoulders at the wheel for the good of the breed. While E. A. Heberline has no official title in this organization, yet he is the "man behind the gun." He has worked hard to get better Durocs in Grant county and he has succeeded beyond expectation. The breeders are strong for the genial Ed and he is sure working for their interest. January 25th has been chosen for their first public sale of Durocs. They expect to sell 40 head of bred sows and we can say that they will compare with any gilts to be sold in the state this winter. Watch Grant county Durocs.—Adv.

Atwater's Durocs.

L. F. ATWATER, Bangor, Wis., is very busy sorting and getting the sows bred that he wishes to catalog for his annual brood sow sale. Several of the sows that he showed so successfully have been bred for early March litters. These will be sold in the sale and they will certainly be attractions. The spring gilts are doing fine and when January 30th comes around you will find the Atwater sale offering in its usual bloom. The sows are being bred to Jack Orion 2d, the under-year boar by Orion Cherry King, that was a winner at Hamline and Milwaukee. He is also using a litter mate to "Jack" that he did not show this fall. The popular demand at the winter sale will be sows bred to these two boars. Proud Chief Jr. is in fine condition and some of the best sows are being bred to him. Last spring's pig crop demonstrated that this boar was a producer of the right sort. A few gilts have been bred to a son of Investor. Mr. Atwater is sold out of boars and is refusing to price gilts. However, he has about 75 fall pigs and will sell these in trios to anyone wanting pigs of that age. Here is your opportunity to get into the registered Duroc business on small capital. The price on these trios is very reasonable. Investigate this offer. See advertisement on page 22.—Adv.

J. E. Barstow 26-Pound Record.

J. E. BARSTOW, Randolph, Wis., has become quite an enthusiast in making A. R. O. records since he completed his first test on a cow that made better than 26 pounds in seven days. From the fact that this is the first official seven-day record that Mr. Barstow has made we feel that he has a great future in this work. He now has several other cows on test and is planning to test out a number of other promising cows in his herd. Mr. Barstow is now using Violet Farm King Agatha Pontiac 176233, whose sire is a 36-pound bull now at the head of the Harvest Farms, Mayville, Wis., and which has seven 30-pound sisters, including Mabel Segis Korndyke, 40.32 pounds. The dam of the sire of Mr. Barstow's herd bull is by an excellent transmitting son of the first cow to make 33 pounds in seven days and a cow that is three-quarters sister to Jessie Fobes Bessie Homestead. See page 21.—Adv.

Tilden Farm's Guernseys.

MR. JAMES H. MURPHY, Delavan, Wis., who is manager of the Tilden Farms, writes that they are now offering for sale several choicely bred young bulls out of imported and American bred dams, having records up to 648 pounds of butter fat and sired by some of the best animals of the breed. Mr. Murphy states that he is also in a position to sell a carload of grade and pure-bred heifers. The Tilden Farms Guernsey herd is tubercular tested and on the state accredited list. While visiting this farm last summer we were very much impressed with the uniformly good quality represented in this herd and are pleased to be able to recommend this offering to our readers. See advertisement on page 23.—Adv.

Herrling's Durocs.

MR. R. R. HERRLING, Glenbeulah, Wis., is offering for sale several choice pigs sired by Royal King 4th 182115 by Royal King 560470. The dam of the pigs is Stillman Queen 579006, she by Prince Defender. Mr. Herrling states that the pigs he is offering for sale are the best in the litter—well grown and would suit anybody. See advertisement on page 23.—Adv.

At Martiny's.

A WISCONSIN FARMER representative recently spent the day with Riley Martiny & Son, the Duroc breeders, Baraboo, Wis. They were getting ready for their winter sale and we are glad to report that they have a bunch of gilts listed that will be hard to duplicate. On November 15th the writer weighed some of them and the heaviest one at that time weighed 335. We feel safe in saying that the 40 head would have averaged 225 pounds. They were busy breeding sows and many were bred during the past week. Four boars are being used. The senior herd boar is Bachelor Gano, a son of Col. Gano, and a boar of great smoothness and quality. Investor Jr. is going to be the "big noise" on this farm. This boar is very thin and it is only natural he should not take on flesh very fast at this time of the year, but we predict that he will be one of the best boars in the state, as his worth as a sire is unquestioned. Martinys have the best spring boar we have seen in the four states we have traveled. He is of March farrow and on the above date weighed 330 pounds. He is thin in flesh, but is the biggest framed pig we have seen. He stands as high as the average yearling and has the necessary length to go with his height. He is a big-type pig in every respect and in some herds would be priced at $1,000. We know of poorer pigs of the same age that have been sold for $1,000. They have named him "Big Type" and he is being used in the herd. All the boars have been sold and no gilts are being offered. They have a nice lot of fall pigs and can sell you a trio worth the money. See advertisement on page 22 and in writing please say you saw the advertisement in The Wisconsin Farmer.—Adv.

W. J. Mann, Waukesha, Wis.

MR. MANN is now offering four sons of King Superba, out of good individual A. R. O. dams. It will be remembered that King Superba is a 34-pound son of the noted Milanhurst America De Kol and was purchased at the great Detroit Holstein sale two years ago by several of the most progressive Holstein breeders of Waukesha county. The dam of one of these calves made 12 pounds in seven days eight months after calving. Another has a 20-pound record and is now giving 80 pounds of milk a day. These youngsters are good individuals, well grown and bred in the purple. We trust, therefore, that farmers looking for young bulls with which to improve their herds will write Mr. Mann for further particulars. See advertisement on page 21.—Adv.

Field Men for The Wisconsin Farmer.

J. R. Garver, eastern half of Wisconsin. Address Room 201, Washington Bldg., Madison, Wis.

T. P. Shreve, western half Wisconsin and eastern Minnesota. Address 115 S. Main St., Janesville, Wis.

W. S. Steele, northwest Iowa, South Dakota, western Minnesota. Address Box 109, Sioux City, Iowa.

Fred V. Johnson, Wisconsin, Illinois, Indiana, Ohio, Michigan and Kentucky. Address 924 Hearst Bldg., Chicago, Ill.

Carlos C. Palmer, eastern half of Iowa and Minnesota and swine division in Illinois. Address 2714 High St., Des Moines, Iowa.

A. T. Cole, Missouri. Address 3900 Holmes St., Kansas City, Mo.

M. T. White, western Iowa and northeastern Nebraska. Address 4015 Izard St., Omaha, Neb.

Henry Field Seed Co. Increase Holdings.

THE Henry Field Seed Co., Shenandoah, Iowa, have made a substantial increase in their plant and equipment by taking over the property of the Ratekin Seed House, of that city. The Ratekin building will be used by the Field Co. as a warehouse at present, but the intention is to make a seed corn house of it later on. This will prove a valuable addition to the Field Co., since they have been in need of more space and greater facilities to take care of their rapidly growing business. H. B. Solon, formerly secretary of the Ratekin Co., has become associated with the Field Co. as assistant to Mr. Pitzer, of the garden seed department. The many friends and customers of the Field Co. undoubtedly will be glad to hear of these changes, since they indicate a substantial growth in the company's business operations. With the new additions they are in position to render a more valuable service and give greater satisfaction to their patrons than ever before.—Adv.

Something Extra Good.

W. C. JENKINS, the Duroc breeder that owns that good breeding boar, Orion Col. S., at Bangor, Wis., has eight boars for sale. Mr. Jenkins had a good demand for his boars and was sold out some time ago. In view of the many inquiries he bought eight boars from neighbors that bought bred sows of him last winter. These eight boars are sure good ones—as good as any Jenkins raised. These boars were weighed on November 12th and the lightest one weighed 237 pounds and the heaviest one 287 pounds. They are sure big-type and if you are looking for the big kind that have quality write Jenkins about these boars. This herd is full of the most popular breeding and it will pay you to investigate these boars if you want good Durocs. Don't forget to mention The Wisconsin Farmer. See page 22.—Adv.

Investigate the Quackenbush Polands.

W. W. QUACKENBUSH, Melrose, Wis., advises that he still has a few of his best spring boars left and in order to close them out by December 1st, he is making a price that will appeal to the man that wants a good boar of this breed. These boars are well grown and, as far as breeding is concerned, no one has better. He has boars sired by eight different herd boars of note and Mr. Quackenbush can fit you out with a boar with breeding that will not conflict with what you already have in your herd. We are glad to recommend this herd of big-type Polands, for we are sure that a man can buy by mail and get a pig that will give satisfaction. Regarding gilts none are being offered for sale at this time. After January 1st they will all be bred to Oakwood Big Model, the senior yearling boar that was first at the Minnesota and Wisconsin State Fairs and at La Crosse. Mr. Quackenbush paid $500 for this boar and we consider him one of the best of his age in the state. The choice gilts in this herd bred to such a boar will be attractions after the first of the year. Read Mr. Quackenbush's advertisement on page 22 of this issue. Write him and mention The Wisconsin Farmer.—Adv.

L. M. Scott at Madison.

L. M. SCOTT'S children had two entries in the baby beef show at Madison which were credits to the Hereford breed. Their junior steer was first in class and was in prime condition. L. M. Scott is the man that has those good Herefords at Bagley, Wis., and anyone interested in registered Herefords will make no mistake if they write him. When doing so please mention The Wisconsin Farmer. See page 23.—Adv.

Swan Brothers' Holsteins.

SWAN BROTHERS, Wauwatosa, Wis., have a few young bulls on hand for sale, including a ten-months-old son of a 22-pound junior three year old, sired by a grandson of King of the Pontiacs. The dam of the calf Mr. Swan is offering for sale is a daughter of Daisy Johanna. This calf is well grown, evenly marked and is being offered at a very reasonable figure. See advertisement on page 21.—Adv.

Damon's Hampshires.

A. L. DAMON, Richland Center, Wis., is one of the leading Hampshire breeders of this state. He has a large herd of the best of individuality and breeding. Good boars have been purchased and they have been crossed with some of the best sows money could buy. Mr. Damon has on hand a fine lot of spring boars and a grand assortment of fall pigs, about 100 of the latter. These fall pigs must be sold and if you will write and let him tell you about his "baby herds" we know that you will be interested in the proposition he has to offer. Note the advertisement on page 23 and write at once for further information. Mention The Wisconsin Farmer.—Adv.

Rust Brothers, West Allis, Wis.

WHILE interviewing Arthur Rust at the Waukesha County Holstein sale we learned that their well-known cow, Ida Lotta 5th, has another 29-pound record to her credit, which has been made recently. It will be remembered that Ida Lotta 5th has stood second in the aged cow class at the Wisconsin State Fair for several years. She is a remarkable cow both as an individual and producer and is a good representative of the type of Holsteins which Rust Brothers have been striving to develop. The Rust Brothers' herd is one of the oldest in the state and many of the best Holsteins of the breed have their origin in this well-known herd. See page 21.—Adv.

Extraordinary Holstein Offer.

IF you want a good, nicely-marked Holstein bull, write W. W. Quackenbush, Melrose, Wis. He has a few extra fine young bulls that are ready for service. These bulls are out of high-producing dams, several of them with A. R. O. records, and sired by Sir Pontiac Wayne De Kol 3d 112197 and King Segis Pontiac Polkadot 8th 157647, herd bulls with excellent A. R. O. backing. Mr. Quackenbush will sell bulls worth the money and prospective buyers will make selections if they but see those being offered. Shipment can be made from Black River Falls on Galesville. Investigate this offer at once. When writing, please mention The Wisconsin Farmer. See page 21.—Adv.

Clarence Wenham's Milking Shorthorns.

MR. CLARENCE WENHAM, Fort Atkinson, has been breeding milking Short-horns for nearly 35 years and now has a herd that in some respects presents an interesting study. At the outset Mr. Wenham has endeavored to breed an animal possessing considerable quality as a beef animal and at the same time capable of producing a good flow of milk, having a high butter-fat test. Mr. Wenham has had a number of animals in his herd that has tested as high as 6 per cent. The herd test now is 4.4 per cent, which goes to prove that Mr. Wenham's efforts in this direction have not been in vain. Sweet Ada, Lady Dina and Lady Cloe all have tested 6 per cent and have given from 40 to 50 pounds of milk per day. His senior sire, Fourthe Barron Cambridge 365455, bred by H. F. Newell, Surry, N. H., is a vigorous individual of good size, yet indicating distinct dairy temperament. Mr. Wenham's junior sire was bred by D. T. Marquart, Milton Junction. Mr. Wenham is now offering a yearling bull that represents the best breeding which he has assembled in this herd and is an animal possessing blood lines that would be difficult to equal. We believe, therefore, that any breeder of milking Short-horns on the market for a herd sire would do well to get in touch with Mr. Wenham regarding this yearling bull, as it is seldom that one has an opportunity of procuring an animal possessing just the blood lines represented in this calf. Mr. Wenham's high-testing cows form an important part in the pedigree of the calf in question and on his sire's side the best breeding of the celebrated May and Otis herds is well represented.—Adv.

John Swenson, Willmar, Minn.

AS a breeder of Duroc Jerseys, John Swenson, Willmar, Minn., is one of the best in that state, in fact the Northwest. A few years ago Mr. Swenson bought Big Wonder, the Iowa grand champion, and said to be the most perfect boar of the breed ever shown at the Iowa State Fair. This boar put Mr. Swenson on the map and the boar is still doing service in his herd. This is also the home of E. J.'s Crimson Wonder, the boar that was grand champion at the Minnesota State Fair in 1916. We feel safe in saying that Mr. Swenson bought more good, high-priced champion sows last winter than any breeder in the Northwest. These, added to what he had, gives to this breeder, one of the best if not the best herd of Duroc Jersey sows in the Northwest. Minnesota has some of the best hogs known to the breed and Mr. Swenson is in the "king row." We are glad to refer you to John Swenson if you want a good spring boar—he has them. We are also glad to refer you to him if you like to deal with a man that is "on the square." Write him for further information and you can feel safe in sending him your order. See advertisement on page 22. Mention The Wisconsin Farmer when writing.—Adv.

Hoyt's Milking Short-horns.

MR. J. WARREN HOYT, Rosendale, Wis., is offering some choice young bulls as well as a limited number of cows and heifers sired by the well-known herd bulls, Kitty Clay's Duke and Kitty Clay's Prince. The blood lines on the dam's side of these young bulls which Mr. Hoyt is offering for sale comprise some of the best families of this partictular strain of Short-horns. See advertisement on page 23.—Adv.

Holstein Bulls for Sale.

MR. F. A. SWOBODA, East Troy, Wis., is offering for sale two young bulls sired by Sir Ormsby Johanna De Kol 37th 141165 and out of heavy producing dams. Mr. Swoboda writes that he can also spare two or three heifers from six to nine months of age from this same sire. See page 21.—Adv.

TOO LATE TO CLASSIFY.

GUERNSEYS FOR SALE

10 HIGH-CLASS HEIFERS, part of them bred. Most of them are by the champion island bull, Governor of Myrtle Place II. He will also be offered. Bull calves for sale, out of cows with records as high as 698 lbs. fat.

Big-Type POLANDS

I RAISED 27 BOARS by eight different herd sires, and have a few choice ones left. Several by CHIEF PRICE 256331, who sired the first prize boar pig at Minnesota and the largest pig at Omaha. Some by Mc'S BIG BONE 257809, and such noted boars as ORANGE WONDER, BIG BEN JR., BLUE VALLEY KING, JUMBO WONDER and SUNRISE PRICE, out of sows that were sale toppers and state fair winners. Act quick if you want a boar. No gilts for sale until after January 1st. They will be in pig to my $500 OAKWOOD BIG MODEL, first prize senior yearling at Minnesota, Wisconsin and LaCrosse. Weighed 870 pounds in August. Correspondence invited.
W. W. QUACKENBUSH (Jackson Co.) Melrose, Wis.

MARTINY POLAND BOAR BARGAINS

SPECIAL PRICE—A little over pork. Twenty Big-Type Poland China Boars, many by Big Bone Wonder, one of the best breeding boars in the United States. Boars of same breeding as my first prize litter at state fair. Also have a Hancher-bred yearling and a Golden Gate Giant fall yearling for sale. Winners this fall. Order a boar. If he don't suit, I'll refund your money.
L. P. MARTINY :: :: Chippewa Falls, Wis.

J. D. McDONALD WEST SALEM, WISCONSIN

HAVE SOME CHOICE spring boars for sale. Same breeding as my WINNERS. Two fall boars that were winners. 75 fall pigs, special prices on pairs and trios.

GERSTDALE JONES ($6,600)

Have four good spring boars for sale by Gerstdale Jones—litter mates to one I am going to use. Buy one of these boars and get in the "front row." Let me quote prices.
Wisconsin's Greatest Poland Herd. :: :: Bred Sow Sale February 6th.

O. C. OLSON, STRUM, WIS.

IF YOU WANT TO BUY ANYTHING in big-type POLAND CHINAS write me. Have a large herd and can supply you with boars or gilts or matured sows. The pigs are sired by BIG TYPE JIM, a son of Jim Crow, and many of them are out of MAC'S CHIEF dams, the boar that was twice grand champion at Milwaukee.

P. N. COLLINS RIVER FALLS WISCONSIN

MY EARLY POLAND boars and gilts are all sold. Have a nice lot of August pigs, that will go cheap, by CHIEF PRICE and SMOOTH JUMBO. Yearling rams sold, some good Oxford lambs. A nice Short-horn bull calf from a heavy-milking dam. Write and tell me what you want—we can do business.

Keep Your Eye Here

I OWN BIG BEN 2D by BIG BEN. I own BLUE VALLEY TIMM 2D. I own GREAT PROSPECT, the 700-pound, first-prize yearling sow at Minnesota, 1917. I own MOUW'S BLACK MAID 2D and other sows that should put my herd "on the map." Nothing for sale but fall pigs.
J. F. O'BRIEN R. 5, Madison, Wis.
"Poland Chinas"

CHANCE

Model Major 2d For Sale

NO BETTER 3-year-old Poland boar in Wisconsin. Second at Milwaukee, but had friends for first place. Can show you good pigs by him. Price reasonable. Guaranteed.
ED W. HENDRICKS Hazel Green, Wis.

SMILEY

IF YOU NEED A POLAND BOAR, write us. Don't forget that a SMILEY GUARANTEE goes with every boar—we never have a dissatisfied customer—get on the list.
WM. SMILEY & SONS. Albany, Wis.

Boars all Sold

HAVE HAD A GOOD DEMAND for Poland spring boars. Now offer gilts, to be alinged when safe in pig. SMOOTH BIG BONE A 2D has made good, his pigs are the first to sell. If you want choice, write now.
J. F. DILEY Rush Lake, Wis.

POLANDS

MARCH AND APRIL PIGS—The best we ever raised. They have the size and bone. Sired by six great big-type boars. See us for herd headers. Also dual-purpose Short-horn bulls.

Build at $200 to $500 Saving!
"Mill to Owner"—Guaranteed Costs

We Still Quote Low Prices Despite Advances in Other Lines

It will cost less **to build now,** in comparison with prices on **all other necessities,** than any time in years. Farm products are bringing 50% to 100% more—yet we can still quote prices on building material only 10% to 15% above a year ago. Conditions after war **must force prices up.** Take advantage of **present** situation.

Model Farm Homes

Practical **5 to 10 room houses. Big, roomy kitchens, entry-washrooms, downstairs bedrooms,** built-in conveniences—a joy to the housewife. Ready-cut—**saves labor, material, time.** Economical. Or not Ready-cut if preferred. Highest grade material. Save "in-between profits." We ship anywhere. Prompt, safe delivery guaranteed. 100,000 customers—some near you.

Costs Less to Build Now!

There never was a better time than now to build your home. In 1914, with corn at 62c, it took 2424 bushels to pay for this house. Today, with corn at $2.00, it takes only 751 bushels. It now costs you less of your crop than ever before.

A Money-Saving Gambrel Roof Home
Plan No. 1326. Unusually popular. Economical to build. Seven rooms. Many closets; porches; modern kitchen with built-in conveniences. Especially well planned. **$1503**

FREE Book of 200 Distinctive Plans Shows **one and two story homes, story and a half cottages, colonial residences, bungalows.** Adapted from leading American architects for **inexpensive building. Guaranteed prices!** No extras, no "afterthoughts." Over 200 approved plans. Sent FREE by return mail if you use coupon.

THE WISCONSIN FARMER

VOL. XLVI. NO. 49. THURSDAY, DECEMBER 6, 1917. WHOLE NO. 1871

Share and Share Alike Proves Best

Type of Mares From Which Crop of Colts Is Produced on John S. Donald Farm, Dane County, Wis.

Math Marty Keeps the Cow Barn Whitewashed as Shown by the Open Barn Doors in Above Picture.

Raymond and Robert, Happy and Healthy Products of the Kobbervig Farm.

THE tenants on the John S. Donald farms at Mt. Horeb are renting the farms on the equal share plan. They have done so for a long enough time to speak with authority of the soundness of the plan, and the satisfaction it gives in dollars and comfort.

John S. Donald is well known and liked by Mt. Horeb poeple, who have four times elected him to the state legislature as the representative in the assembly and in the senate. He has also been our secretary of state for four years. Since he was born and raised on a farm in Springdale township, only a few miles from Mt. Horeb, he has the right point of view regarding farming and farm problems.

It is therefore quite natural that Mr. Donald came to the conclusion some fifteen years ago that the cash basis of renting was a poor proposition for landlord and tenant alike. Experience in renting on the cash basis had taught him that after the cash is paid the tenant must, in justice to himself, make the most of his farm operation at the least expense to himself. That the landlord cannot be gainer when soil robbing is practiced was a further observation. Upkeep of the buildings and fences was not to be expected and never occurred. The general appearance of the farmyard ever proclaimed in loud tones that the occupant did not intend to stay longer than one season. The length of the tenant's stay on the place was indeed governed by the profits he made during the year after paying a cash price for each acre rented.

After trying the system of equal sharing for several years Mr. Donald placed his other farms on the same basis, and he now has satisfactory tenants on all three farms. Financially ahead year after year, tenants and landlord are working in perfect harmony from one season to the other.

Everything is on the half interest basis. The landlord furnishes the house, barn and acres. The tenant agrees to work the land, to pay and board all labor and to furnish the necessary machinery for tilling, seeding and harvesting. Mr. Donald buys half of the cattle, horses, seed and poultry. Each farm has on it enough horses to take care of all the needs of the farm. Two brood mares are usually kept on each place and from these the foals are raised each year to displace the depreciating horseflesh and also to help, through sales of surplus horses, to add to the farm profits. The landlord pays half of the service fee and receives half of the sale price of each animal sold.

In the poultry end the choice is left to the tenant to raise chickens for market or sell the eggs. In either case, the first $10 worth of sales belong to the tenant, after which all proceeds are divided equally between the tenant and landlord.

All feeds raised on the farm are marketed through the cows, hogs and horses that are raised on the farm. All stock has the use of a pure-bred sire. The horses are bred to a pure-bred Percheron stallion, a registered Holstein is the herd header for the dairy, and the hogs are pure-bred Poland Chinas. There is enough woodland pasture and meadow on each farm to give the animals plenty of cheap feed during the summer months. Alfalfa and clover in a regular rotation help to make greater production in the milk cows possible.

Matthew Marty has been on his farm for the first year this season. He has rented it from Mr. Donald on the share basis following the death of his father, who farmed it on the same plan for the last eight years. "I believe the equal-share system is the best system upon which to rent a farm, as it gives the renter a greater opportunity to make a profit one year after another. The landlord is more willing to do something for his tenant on this basis, while on the cash basis the landlord takes no interest whatever in his tenant as long as he is sure of his money." Mr. Marty is progressive, as is witnessed by the whitewashed cow barn plainly visible even to the passerby. His grade herd of Holsteins is going to improve steadily under his care, for he feeds and cares for them in the right manner.

Albert Kobbervig, who farms another of Mr. Donald's farms, has been on the place for eight years and has no intention of renting on anything but the present basis. His well-kept yards and barns show that there is existing between the landlord and the tenant coöperation which makes for success. Cows, hogs and horses produce regularly the profits upon which both landlord and tenant depend.

Alva Lust, who has been on the third farm now for the sixth year, is also emphatic in his endorsement of the "share-alike" plan. He would not think of farming on a different basis and his satisfaction is evident all through his conversation. His herd of Holsteins shows the care of a master feeder. He is just as conscientious in taking care of all other stock even though he has only a half interest in them and can expect only one-half of the profits derived from the sale of milk and meat products. His seed corn for the coming season has been safely placed in a spare room above the kitchen.

Mr. Donald is as satisfied with his tenants as they are with the landlord and though he gives much credit to the system, he has every regard for the individual coöperation which is essential to the success of the plan. It is not often that the change in tenants takes place, but when this happens horses and cows and all other belongings are divided into equal numbered groups and the choice is given to landlord or tenant as to which half interest he prefers.

Contracts with new tenants are made for a two-year period, at the end of which time either landlord or tenant is privileged to give notice in September for a discontinuance of relations to become effective the following March. When leases are made for only one year they are usually unsatisfactory, in the opinion of Mr. Donald. Both tenant and landlord have more opportunity of a fair chance for an understanding over a longer period. "Share and share alike is to me a more businesslike proposition," said Mr. Donald. "I am convinced it holds the interest of the tenant to a greater degree than any other system. It leaves a fair profit for both sides and insures continued productiveness."

CURRENT EVENTS

THE British troops, having broken through the German line in northern France, were continuing their progress, although slowly, at the beginning of the week. They are bombarding the town of Cambrai, which is an important railroad junction, and are trying to surround it so as to make its early capture inevitable. At the same time, the Germans are rushing reënforcements there and are making a determined resistance. The British troops gained a great amount of ground in the first few days and released that portion of the French population in the immediate vicinity which has been held prisoners by the Germans for the last three years. The progress since the first days of the big push has been slow, but the British have been able to hold the ground gained, for the most part. While this fighting is in progress, English and French troops have been rushed to the relief of the Italians, who are still able to hold the German and Austrian invaders on the Piave river, within twenty-five miles or so of Venice. It begins to look as though the allies would be able to check the Teutons in northern Italy, while at the same time making enough gains in northern France to give them the advantage in recent fighting. American engineers are said to be participating in the British push, helping to lay the railroads which are so necessary to bring up men and supplies.

A PLEA for peace came from an unexpected quarter last week. The Marquis of Lansdowne, one of England's most noted statesmen, came out in a public statement in which he urged that peace be brought about as soon as possible, not necessarily waiting for the complete defeat of Germany. Lord Lansdowne contends that an immense stimulus probably would be given to the peace party in Germany if it were understood: "First—That the annihilation of Germany as a great power was not desired. Second—That we do not seek to impose upon the German people a form of government [illegible] their choice. Third.—That, ex[illegible] ultimate war measure, we [illegible] to deny to Germany her [illegible] the great commercial [illegible] Fourth—That we are pre[illegible] the war, in concert with [illegible] to examine the interna[illegible] connected with the freedom of the seas. Fifth—That we are prepared to enter into an international pact under which ample opportunities would be afforded for the settlement of international disputes by peaceful means." The Marquis of Lansdowne is a typical representative of the old Tory party. He was a member of Asquith's coalition administration and was secretary for foreign affairs in Lord Salisbury's and Mr. Balfour's ministries. He was viceroy of India and governor general of Canada. He was the last public man in England to be suspected of pacifist tendencies.

OVERTURES have been made to Germany for peace by the Lenine faction, which controls the Russian government at present, having overthrown Premier Kerensky and his government. In fact, a delegation has been sent to Berlin from Petrograd and every effort is being made to end the war between Russia and Germany while the Lenine faction is in control in Russia. Official confirmation of the news from London that German staff officers are in Petrograd acting as military advisers of the Lenine faction probably will be followed promptly by action on the part of the United States and the allies definitely to place the Lenine regime in the list of Germany's allies. If the Germans are there, all doubt as to the purpose of the Lenine faction is removed, and the diplomats will be obliged to withdraw to a neutral capital. Such a development undoubtedly would be followed by immediate cancellation of all orders for supplies for Russia both in the United States and Japan. Several cargoes from the United States are now on the way to Vladivostok, but these can be diverted by wireless orders, and it has been understood that their delivery would be contingent upon evidence that they would not fall into unfriendly hands. With Germans openly advising Lenine and his followers, it is assumed that efforts will be made to carry Russia into the position of an active ally of the central powers. This might produce a most serious situation by making available to Germany the vast stores of food, oil and cotton of Russia and even though the Teutons found it impossible to convert the disorganized country into an active military ally, the million or more German, Austrian and Turkish prisoners held in Russia would be freed for service with the Teutonic armies.

SENATOR HARDING, of Ohio, believes that the government, as a war measure, should enact legislation providing a farm for every soldier returning from the great war who will consent to accept one. In the meantime he suggests the experiment of placing on farms provided by the government, dependents of soldiers and aiding them to cultivate the land. "Not every one, possibly not 25 per cent. of the 2,000,000 men who come out of the ranks at the end of the war," Senator Harding admits, "would want to go on a farm, but 25 per cent would be 500,000 farmers—500,000 farm homes for the future where there were none before. If but 10 per cent wanted to go on farms, there would be 200,000 farm homes established," He says. "This would be no mean asset to the nation. Every thoughtful man realizes that the proper distribution of the land is the basis of national well being. The land should, as far as possible, be in the possession of the men who work it. The magnificence of France, when the supreme test came, has been largely due to the sturdy folk on her farms. They have been the saviors of France in many emergencies."

PROFITS of the wholesale meat industry have been cut to 2½ per cent on each dollar of sales, with the five large packers of the country further restricted to a yearly profit of 9 per cent on the average capital used in the business and temporary returns of 15 per cent on by-products. Joseph P. Cotton, head of the meat division of the federal food administration, announced this policy. The restrictions cover the business from November 1, 1917. Packers are prohibited from adjusting the price of one variety of meat at the expense of others. Their business will be the subject of close scrutiny by the administration. They will not be permitted to conceal or divert the returns by use of other industries. Small packers will be protected from the larger ones. Packers of the nation are divided into groups. The Armour, Cudahy, Morris, Swift and Wilson companies are in one division and other packers are in the second class. The five larger packers are to be charged with the duty of supplying all meats for the allies and United States forces. All others will be required to supply meats for all other domestic consumption.

OPERATION of all railway lines east of Chicago as one centralized system was decided on by the railroad war board, to obtain a maximum of efficiency in traffic movement. Cars and trackage facilities will be pooled, regardless of ownership or the railroad's individual interest. This almost revolutionary move was announced after an all-day conference between members of the war board and government officials, at which many remedies were offered for the freight congestion that has paralyzed transportation in the East. It was adopted as the best and readiest means of meeting a situation that has threatened the production and dispatch abroad of war materials. The roads will be operated by a committee of vice presidents of the lines, under the general direction of the war board, itself comprising five of the country's railway heads. The committee of vice presidents will be given full authority to adopt any measures found necessary to accomplish a unified operation. The operating program calls for the following: Diversion of locomotives, employes and machine tools from western to eastern railroads. Utilization of repair shops on western lines for repairing eastern equipment. Pooling of all tracks and equipment in the east wherever practicable. Pro-rata distribution among eastern roads of open top cars on a basis of tonnage carrying capacity of the equipment in the pool. Diversion from congested lines of freight that can be handled by any open route.

ARRIVAL of American troops in France has kept pace with the expectations of the war department, Secretary Baker said in the first statement he has ever authorized in connection with the progress being made in increasing General Pershing's forces. Mr. Baker declined, however, to state the number of troops forwarded or to indicate whether he anticipated delay from this time. Movement of the forces, he said, depended on two elements, the training and equipment of the men and the availability of ships. "As fast as they are ready, ships and men will be combined," the secretary said. "As many American soldiers are now overseas as we expected in the beginning to have overseas at this time." Mr. Baker indicated that an official statement of the number of American troops in France was not to be expected at any time during the war.

Farm Machinery Must Be Conserved.

Department of Agriculture Gives Some Advice in Press Bulletin.

During the coming winter farmers should give careful attention to the work of repairing all machines which will be used next season. Also, orders for repair parts and new machines should be placed as soon as possible. This will acquaint manufacturers and and their agents with the demand in different sections and enable them to make the best possible distribution. At the same time, it will eliminate expensive delays in transportation at the busy season.

The use of the largest and most improved farm machinery, always desirable, is of special importance. Where large acreages are farmed the largest machinery is the most economical. Many of t[illegible] improveme[illegible] their purc[illegible] the stand[illegible] though the [illegible]

All worn-out machinery should be sold for junk at the first opportunity, the specialists advise, first removing all bolts or other parts which might be useful in repairing other equipment. It is usually false economy to attempt to use a worn-out machine, as the time wasted with breakage and other delays and the extra power required for its operation usually more than offset the saving effected by continuing it in use.

More damage can be done to a machine in half an hour through lack of oil or grease on some bearings than by a whole season's exposure to the weather, the specialists declare. For this sort of neglect there can be no excuse, it is said. Operating a machine without lubrication, especially when the bearings are slightly rusty, will quickly result in the wearing away of the metal, often to a considerable depth, in a very few minutes. Expensive breakages, as well as serious delays, also may be caused by operating machines on which nuts have worked loose or have come off entirely, allowing bolts to loosen or drop out.

All practicable steps should be taken to preserve machinery now on hand. Needless exposure to the weather should be avoided, and in cases where it is not practicable to house machinery when idle, all bearings should receive a thorough application of heavy oil or grease to keep out moisture anud prevent rust. It is believed that on many farms machinery could be more adequately sheltered in the buildings available by exercising care in placing them so as to economize space.

Recent regulations of the federal food administration prohibit the holding of cottonseed in larger quantities than twenty tons for a period longer than sixty days. The plan is to get the cottonseed oil and cake on the market as rapidly as possible and to prevent hoarding.

A Good Tractor to Own

A MOGUL 10-20 kerosene tractor will go a long way toward solving your labor and expense problems. Men who use this tractor properly say it does as much plowing, disking and harrowing in rush seasons as three men and nine horses. In the heat of the harvest fields, and for summer plowing, three four-horse teams can hardly keep up with it, because it works steadily all day long.

Besides, it is so simple that almost anyone can learn to handle it efficiently. A few days' training in the handling of a kerosene engine is usually all that is needed.

These two features make the Mogul 10-20 highly desirable. Add to them the fact that it operates on a fuel that you can always buy, and at a reasonable price, and you have a power plant that is hard to beat for all-the-year-round work in the field or at the belt.

You know the standing and reputation of Mogul tractors. When you buy a tractor, don't overlook this good, simple, reliable, economical three-plow Mogul 10-20. Booklets and folders give complete information. When you write for them, address

Durability, quiet operation, clean, fast grinding, safety and freedom from trouble are characteristics of the

IMPROVED DIAMOND FEED GRINDER

Model "C" Diamond Grinders are particularly recommended for average farm requirements. They have *all* the features you want in a feed mill.

New relief lever permits shaft to run free from buhrs, allowing temporary stop without throwing off belt or stopping engine. *Shaft Runs in Oil* and has end thrust ball bearing with oil well and chain oiler. *Pulley on end of shaft* allows belt being thrown off easily and quickly. *Three sets of buhrs*—fine, coarse, medium—made of irridium iron. Long wear, even grinding, perfect satisfaction guaranteed.

The Wisconsin Farmer

THURSDAY, DECEMBER 6, 1917.

FAMILY CIRCLE TALKS BY THE PUBLISHER

FARM MACHINERY GIVEN RIGHT OF WAY.

I AM glad to see that one branch of the government, at least, realizes the seriousness of the farm situation and proposes to do what it can to relieve it. I refer to the War Industries Board. This board has taken steps to give priority to the shipment of tractors and all agricultural implements, rating them second only to actual munitions of war.

The freight car situation is daily becoming more serious. I saw an item in the paper just a day or two ago in which the statement was made that the government had commandeered 1,500 freight cars in which to ship lumber from the Pacific Northwest to the shipbuilding yards in the East where wooden ships are being built. Cars are being seized almost daily for other governmental work connected with the war. The War Industries Board proposes that farm production shall not suffer more than can be helped, because of this necessity for shipping guns and munitions of war at top speed across the continent.

As I understand it, the War Industries Board does not give a special priority classification to any particular kind of freight, the uses to which it is to be put determining its rating in preferential handling by the railroads. Tractors to be equipped with guns, destined for France, have the highest rating of A-1. Tractors and other farm machinery to be used in crop production during the next year are rated B-1, the highest classification for freight not intended directly for military purposes. A friend sends me a newspaper clipping containing this additional information:

A special war emergency committee of the National Implement and Vehicle Association has been established by the War Industries Board at Chicago. C. S. Brantingham, president of the association, is chairman of the committee. All requests for priority for farming machinery are sent to that committee and its recommendations submitted to the War Industries Board.

In addition, the board is making every effort to insure steel for manufacturers of farming machinery. The board has been deluged with appeals for steel, and it was stated today that everything possible is being done to supply it.

This is as it should be, and I am glad to see the War Industries Board taking such a firm stand. We must have crop production next year, if our soldiers in the field are to win their fight. Without crop production here at home our armies abroad are at the mercy of the foe. The war hinges on our farms as much as on our training camps and our munition factories.

I congratulate the government on discovering, before it is too late, that nothing is more important than that every possible mechanical aid to farming should be placed, without undue delay, in the hands of every available farmer. It may be the beginning of a policy which shall give the farmer labor relief before it is too late.

A NEED FOR REAL CHARITY.

I FIND that in the midst of plenty and prosperity here in the grain belt there are likewise misery and want. Fields have yielded abundantly; yet there are those who, when prosperity was passed around, were not able to help themselves. There are doubtless divers causes: Sickness, bad luck, poor management, army service, and so on and on. But whatever the cause, the result is the same—need, now as winter comes on. It is the duty of those of us who have plenty, or enough, to divide with those who need, especially at this time when the military draft has taken away so many of the breadwinners from so many of our farms.

A fortnight or so ago I printed the letter of a good "mother in Israel" who asked me to give her the name and address of some woman who could make good use of children's outgrown clothing. That letter has brought me dozens of requests for that clothing, for any assistance which I can give or secure. I cannot refrain from quoting from a few of these letters and then telling you what I think you and I, working together, should do. Here is one of the letters which touched me most deeply:

Dear Mr. Pierce: My husband works out by the month. We have six children and he only gets $35 a month and his board, but has house rent to pay. We have no milk, just what we buy at the store. He does not use tobacco, neither does he drink. He is a good hand on the farm, but just because we have a family and people know he can't be idle, they won't pay any more than they can help. So if you could help me find someone that has any clothes that their children have outgrown, or shoes, I would ask God to bless and prosper you and yours for all time. We will help some other poor family when the children are grown to men and women.

I like that last sentence; it shows appreciation. I have already taken steps myself to relieve this particular case. Here is another letter:

Dear Mr. Pierce: I have four children, from two to twelve years old, and we are proving up on a homestead. All who have done that know what one has to go through. My children have to walk two and one-half miles to school and have not the necessary clothing to keep their little bodies warm.

I cannot stand it to think of children suffering. I hope this will be one of the first cases relieved. Here is a letter from an old couple:

Dear Mr. Pierce: Neither my husband nor I have good health. We have two sons absent now, one in the army, the other in the navy. We do not get any help from either one. We would be glad to get anything in the way of clothing or food.

Some day the government will take care of such parents and honor them as they deserve to be. In the meantime, it is up to us to relieve the situation. And here is a letter which brings the tears to my eyes every time I read it:

Dear Mr. Pierce: I see you are helping others and maybe you would help me. My papa died December 6, 1916. We lived on a rented farm. After papa died we had to leave the farm. We now live in town. Mama does some washings to help keep us. There are three of us children. I am the oldest one. I am eleven years old. Please tell that lady that I could wear some of her outgrown clothing if she has any more to give away. Please do not print my name in your paper; some might laugh at me.

I would like to see anyone laugh at that child in my presence. She shows a heroic spirit which I think is splendid. I hope some of my charitable readers will take up this case right away, without delay.

Now here is what I propose to do: I shall turn my office and office force into a sort of clearing association for the letters of the needy and of the generous. If those who have clothing to give away will write to me, I will send them the names of two or three families, in their state or part of the country, who have written to me asking for help. In this way I can bring those who have and those who need into communication. But I shall not stop with this. I want to do my share, so I make this offer: If everyone who sends a box or package to those whose names I furnish (send it by express or parcel post, freight is too slow and uncertain nowadays) will send me a receipt for the amount of carrier charges, I will send them my personal check to cover the bill. Always prepay the charges; some of those who need help cannot even afford to pay the charges. Then send me the receipted bill and I will refund the money to you at once.

The need is great, it demands immediate relief. Will you join with me in driving misery and hunger from as many homes as we can hear of, in bringing joy to many and many a wearied mother's and a perplexed child's heart? Remember the words of the poet:

The Holy Supper is kept, indeed,
In whatso we share with another's need;
Not what we give, but what we share,
For the gift without the giver is bare;
Who gives himself with his alms feeds three,
Himself, his hungering neighbor and Me.

SAVING THE FOODSTUFFS.

I FIND that the question of food conservation (of the substitution of equally palatable and nutritious articles for meat and wheat) is occupying the minds of many of my readers. This is a good thing. The world-wide war will not be won by men and guns alone; food and money are of almost equal importance. It would avail us nothing were we to send millions of highly-trained soldiers to Europe and then deny them the foodstuffs necessary to sustain and strengthen them; if we were to send shiploads of guns and then not raise the money with which to make and to pay for the ammunition for these guns.

Most of my readers who write to me on this subject get right down to brass tacks, as the saying goes. They do not indulge in glittering generalities. They do as Mr. McLean did a few weeks ago: Tell how to make whole-wheat bread by grinding the wheat at home, or give other equally practical advice. Here, for instance, is a good subscriber, Mr. H. C. Morgan, pleading for the saving of beef and pork and the utilization of the rabbits with which the grain belt now abounds. Let Mr. Morgan speak for himself:

Dear Mr. Pierce: We can well afford to divide our meat and bread with our brave soldier boys. I believe a change of diet would improve our health in many cases. Instead of ham and eggs, hot biscuits, pie, cake and coffee for breakfast; beef, bread, potatoes, pie, cake and coffee for dinner; meat, bread, ice cream, cake and coffee for supper, let us have rabbit and pork sausage, meal cakes, milk and butter for breakfast; chicken, wheat bread, potatoes, milk or tea for dinner; corn bread, potatoes, milk, butter and eggs for supper. In that way we could cut down our beef, pork, wheat bread, sugar and coffee 25 per cent—that much more of substantial food to put on the market for our boys. Our rabbits are becoming so numerous in this country that they have become a nuisance. One jack rabbit ground up with an equal amount of fat pork makes first-class sausage. Now let as many as will join in a five-month rabbit drive. Some can be used for the table and some for market.

I am sure the boys will agree heartily with Mr. Morgan. Nothing would suit them better than a five-month rabbit drive. Is not the suggestion a good one?

Here is another good idea, from a woman subscriber this time. Now that farmers' neighborhood clubs are flourishing in such large numbers in the grain belt, and whole communities come together so frequently for social intercourse, the question of refreshments at such rural gatherings is far more important than it was a few years ago, when such meetings were rare. Once more, let my correspondent speak for herself:

Dear Mr. Pierce: Now that we are doing everything possible to save food for the soldiers, would it not be a good idea to cut out all refreshments at our clubs and societies during the period of the war? Now, I know this will not suit some, but if they are patriotic they will make this sacrifice. Surely, if our dear boys can sacrifice their lives, we, as a nation, can sacrifice some of our pleasures. We could still have our social gatherings, but omit refreshments. Most all gatherings serve sandwiches with meat filling, butter, coffee, sugar and cakes, the most necessary things for shipping. Now, most laboring people do but little entertaining after their day's labor. They are too tired to go away. Is it right to ask them to sacrifice on their three meals that they need so badly to keep up their working abilities until this other is done away with?

There is certainly merit in the suggestion. We can have just as enjoyable literary programs, just as inspiring patriotic meetings, just as splendid get-together conferences of all kinds, without any unnecessary waste of food. The spirit of sacrifice and self-denial is abroad in the land; shall we not use every opportunity to advance it, to make it bear tangible results which shall make possible the early winning of the war?

But, says another correspondent of mine, a modest little lady in Lacon, Ill., who wishes her name withheld: "The problem of saving is not one for the women folks alone. Are the men doing their share?" Here is her pertinent query:

Dear Mr. Pierce: My father has taken your valuable paper for many years. It is a very welcome visitor. We all look forward to its coming and pass it along to do more good after we have all read it. One of the most important questions you are discussing nowadays is that of "food conservation" and "economy in the kitchen." Who is more careful than the average farm wife? What is left over from one meal we utilize in some way for the next. We are willing to have our meatless days and our wheatless days. As yet have heard nothing about the tobaccoless days, cigarless days. Now, if you men are really patriotic, cut it out two days a week. Don't expect the wife to do all the economizing in the kitchen. And how about your wheat bins and corncribs? How many rats are you feeding? Are you trying to rid your premises of rats? Now, remember to do without that after-dinner smoke. It's just habit. Count up your tobacco bill for one month. You didn't think it, did you? If your wife had asked you for that amount you would have declared you couldn't spare it. I believe in economy, but don't let it be a one-sided affair. Pull even. Have two tobaccoless days each week before Christmas and you will have more money to buy presents with. Don't kick or swear about it. Look pleasant and take your medicine and help eliminate all kinds of waste. It's our duty.

I read the other day of a man who made a habit of giving as much to the "Smokes for Soldiers" fund as he spent on his own tobacco; every time he bought a nickel cigar he dropped a nickel in the barrel where collections are taken up for soldiers' tobacco. Of course, this only works where a man can afford it. Those who cannot afford this double expenditure would do well to consider my correspondent's inquiry. We cannot say to our women folks, "Save, save, save," over and over again, day after day, and not do some of the saving ourselves. Let us be consistent as well as patriotic.

The duty is upon us all to work hard, in order

(Concluded on page 6.)

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES.

BY JAMES M. PIERCE

JAMES ATKINSON, EDITOR-IN-CHIEF

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter.

PUBLISHED EVERY THURSDAY

1912 Grand Avenue Des Moines, Iowa — 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscriptions or advertising may be addressed.

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address THE WISCONSIN FARMER, Madison, Wisconsin

Wisconsin Holstein Meeting.

It is just a little over a month until the annual meeting of the Wisconsin Holstein-Friesian Breeders' Association will be held at Burlington, Racine county. This is always an important state meeting, but it is doubly so this year by reason of the fact that one of the many objects of the session is to perfect the preliminary arrangements for the entertainment of the national convention to be held in Milwaukee next June.

The dates set for the Burlington meeting are January 8th and 9th and plans have been made for morning and afternoon sessions on both days. On the evening of January 8th the visitors will be given a banquet at the Chamber of Commerce. Another part of the program of special interest will be the inspection of the Wisconsin Condensed Milk Company's plant, where lunch will be served.

The meetings at Burlington are open to all who are interested in the Holstein-Friesian breed of cattle and the advancement of the dairy business in Wisconsin. Undoubtedly this will be one of the most mportant dairy meetings ever held in the state, and, being situated in the heart of the milk-producing district, the attendance will, of course, be large. Burlington may be reached by the Soo Line or the Racine-Freeport division of the Chicago, Milwaukee and St. Paul Railway.

The Wrong Time to Quit.

Some discouraging conditions have been met this year in farming operations and it is not an unusual thing to meet an individual who proposes to sell out his live stock and implements, rent the farm and make a bolt headlong for town or city. In some cases the military draft has worked hardships and instances can be found where a farm owner or even a renter has been left with 100 to 125 acres of corn to be put in the crib by himself alone. The sappiness of the corn and a warm November combined have greatly delayed husking so that in such cases there is really a big undertaking ahead during December and possibly for the balance of the winter.

We can well enter into the feelings of the man who is so discouraged that he proposes to turn his back on the whole thing, but a word of caution may not be out of place. There never has been a time in this country when it was so necessary for every man to be in his right place and from the standpoint of production it is of the utmost importance that even those who consider themselves getting along in years should stand by their post and do their full part.

In any event, retirement from the farm seldom brings that joyous relief that is so fondly anticipated. Some time ago we called attention to a case where a corn-belt farmer sold out his live stock and implements, rented his farm and moved to a near-by town, planning with great enthusiasm to spend the rest of his life happily and serenely. The farm, in this case, was rented for a two-year period and this man found his living expenses greatly in excess of what he anticipated. The rent from his land did little more than to cover the cost of his dwelling house and he even had to skimp along to buy gasoline for his automobile. The house he rented was not in good shape and when repairs were asked for there was no response. If they were to be made he must make them himself. One trouble followed another and all in all his life was filled with fretfulness and annoyance. No one in town cared especially for his society because he found that the time of business men was fully occupied and he did not fit in with the ordinary town-bred loafer.

The end of it all was simply that in two years this man was back on his own farm, having had enough experience in the enjoyment of the loafer's life to last him for all time. Work never seemed so good to him and he learned at a considerable money cost that true happiness comes when one is engaged in daily tasks for which he has been fitted by past experience.

This particular case could be matched by hundreds and thousands of others and, while we do not take it upon ourselves to say that no man should retire to the towns and to the cities with advancing years, we do unhesitatingly aver that in these times no man who has any physical fitness left in him for farm work should leave the farm. He can "do his bit" there better than elsewhere and the labor he performs himself will not only count, but he is the man to direct the effort of others. There will be some greenhorns in farm work to deal with until the end of the war and the landowner is the one to remain in charge. With nearly all farm implements of the riding type, there is not the same degree of irksomeness about labor that formerly existed and a man can be considerably advanced in years and yet at the same time retain the ability to do an important part in putting in and taking off a crop.

Fertilizers in Rock County

R. John Clark, of Janesville, and J. F. Kemmerer, of Clinton Junction, Wisconsin, are two men who have used fertilizers on their farms during the last year and who have become convinced that there is a distinct benefit in yield and therefore farm profits in doing so. J. F. Kemmerer bought a complete fertilizer, which means one which contained phosphorus, potassium and nitrogen and applied it on forty acres of corn land. His crop of corn was exceedingly good and, though he was located in a section where all the corn was frozen by either the first or the second frost, his field escaped with very little damage. This was possible only because the added nourishment enabled the corn to obtain such a start that by the time the frost appeared it was out of danger. As a result he has today from these forty acres 500 bushels of seed corn in excellent condition, which, if the signs do not fail, will be worth next spring at least $6 to $8 per bushel. The total cost for this fertilizer did not exceed $100. His crop of corn was saved and he was enabled to have a big yield of seed corn available to be sold at a good price besides. He is hardly in doubt about the advantage of using fertilizers for his field.

Mr. Clark had his soils tested by the college of agriculture in 1915. The first thing he learned was that part of his soil was acid. The next piece of information he received was that a limestone pit in his fields contained limestone testing 98 per cent pure and that there was enough of it to lime all the farms in the township. The analysis showed him exactly where lime was needed, where manure was necessary and where phosphorus was required. He followed the advice of the analyst and his corn showed the results plainly. Wherever the application of fertilizer had been made the corn grew rapidly and considerably faster than all other corn unfertilized. This continued throughout the season during rainy weather as well as during the hot weeks. However, the frost which came September 6th proved too much for all the corn and also severely injured Mr. Clark's field. Nevertheless, he has profited to the extent of several dollars over the expense of purchasing and applying the fertilizer by the increased growth of the stalks and the greater tonnage of silage obtained. On one field of corn a complete fertilizer was applied and another received only the acid phosphate of 14 per cent strength. On each field checks were made by skipping large strips of forty rows or more in order to bring out the difference between the fertilized and unfertilized sections.

All summer long these fields were the wonder of the neighbors. The green heavier growing corn could be seen from the roadway.

Many were the visitors who wanted to know why there was such a difference of a part of the corn. The result of this work on the part of Mr. Clark will be noticeable next season when many Rock county farmers having applied fertilizers to their farms will produce more per acre and do so at less expense of the present fertility content of their soils.

The highest cost per acre for the fertilizer was $1.40; the lowest 90 cents. The difference in cost was not warranted in the case of this particular field, as the lower-priced fertilizer did fully as well as the other.

The soil analysis furthermore showed that all soils tested were markedly acid. In the report these things were brought out and the proper course to be followed was included with the discussion of each sample. A specimen of the discussion which goes with each sample is given here just as Mr. Clark received it:

> The soil represented by this sample is soil that has been cropped a long time without having very much fertility returned. This soil in its virgin condition contained a very high amount of nitrogen and phosphorus. Now that the soil has developed a high degree of acidity, the active humus has been reduced so that this soil has become rather inactive—inactive to such an extent that the organisms in the soil cannot work to best advantage and the other chemical reactions in the soil do not go on sufficiently to enable the soil to give up to the crop the fertility element required.
>
> The first step in improvement is liming. The second is the growing of clover and plowing under the clover sod and second growth of clover as frequently as possible. A three-year rotation such as corn followed by grain, followed by clover, practiced on this field for a few rotations (and liming should be practiced before this is begun) is to be recommended to get this land back into good producing condition. The addition of raw rock phosphate to the manure which is applied to this land is to be recommended. This application should be made at the rate of 1,000 pounds of rock phosphate per acre. One application now and another one in about five or six years will go a long way in correcting the conditions prevailing with reference to available phosphorus supply.

Of course, all recommendations made by the soil analyst cannot be followed, but in the main the ideas can be adopted to good advantage wherever possible. Mr. Clark is doing this and will continue to do so and profit by it.

Why Bigger Crops are Needed.

It is possible to get some idea of the declining production in the war-stricken countries of Europe by the official figures from France on wheat production. In 1913 France produced 146,383,330 bushels of wheat. In 1914, the first year of the war, this was decreased to 128,000,000 bushels; in 1915 it was still further decreased to 101,000,000 bushels. The crop of 1916 was only 97,000,000 bushels and the 1917 crop, just recently harvested, amounted to only 66,000,000 bushels. From these figures we get some conception of the responsibility resting upon us to produce more food for the soldiers as well as for the noncombatants in France. In 1913 France produced foodstuffs, including cereals, potatoes and beets, amounting to a total of 35,800,000,000 pounds and in 1917 this had decreased to 22,200,000,000 pounds. The state of Wisconsin has come nobly to the rescue in doing her share to add to the production of the world's food, but we must do more next year. Of course, the food supply of the world does not depend upon the crop in Wisconsin, but by reason of peculiar conditions here we are able to help out a great deal.

Hog Cholera Control.

In a press bulletin published by the national department of agriculture attention is called to what has been accomplished when organized effort was put forth to control hog cholera. In the bulletin referred to the matter is summed up as follows:

> Although hog cholera cannot be completely eradicated from the United States under present conditions, losses [illegible]

Department of Agriculture in experimental work in hog cholera control carried on in a number of counties during the past four years. The work and its results are described in Department Bulletin 584, "The Control of Hog Cholera," recently published by the department.

One of the important results, according to the bulletin, is the fact that the work while effective in reducing the disease, was not repressive while in progress on the hog-raising industry. On the contrary the industry thrived in the experimental counties to a greater degree than in adjacent counties in which no control work was under way.

Actual statistics were taken in the experimental counties and careful estimates were made in the adjacent counties. These show that in one group of three counties where the control work has been under way four years the percentage of loss from hog cholera has remained constantly from one-fourth to two-fifths the percentage of loss in the fifteen surrounding counties. In another group of experimental counties the average percentage of loss as compared with that in eighteen surrounding counties was reduced from approximately nine-tenths in 1913 to less than one-third in 1914 and to about one-sixteenth in 1915.

Specialists who have supervised the control work of the department reach the conclusion that while the eradica- of hog cholera cannot be expected for a considerable time, the material reduction by the use of serum of the enormous losses which annually are caused by the disease is entirely practicable. The essentials for success in combating the disease, they point out, are interest on the part of hog raisers and knowledge of the disease; organization which will facilitate exchange of information as to outbreaks, and secure assistance; serum at reasonable prices and easy of access; and the available service in the community of persons skilled in administering serum.

Where there is no organization that has for its purpose the work of stamping out cholera in a given community, each individual swine breeder should in his own self-interest guard against the spread of the disease when it once makes its appearance in his herd. The department of agriculture is not advocating the plan of administering serum to all healthy hogs regardless of whether cholera is in the community or not, but it does advocate most strenuously the plan of quarantining the first sick animal that shows up in the herd, having this examined for the

presence of cholera, and the treatment of all the well animals in the herd if this disease proves to be present.

War-Time Feeding of the Dairy Cow.

The Wisconsin Experiment Station Dairy Extension Service has been giving some study to a war-time concentrate mixture for dairy cows. This is in the campaign for the purpose of getting better production. Local prices are, of course, taken into consideration in adopting the mixtures suggested.

Under present conditions many farmers may be tempted to feed some such home-grown grain mixture as a mixture of ground oats and ground corn, or corn and cob meal, or barley meal. Fed with silage and even good clover or alfalfa hay, such grain mixtures will not furnish enough protein and will, therefore, produce considably less milk than a better balanced ration. Rather than using such a grain mixture, it will pay to sell some of the home-grown grain and buy protein-rich feeds to balance the ration.

A thousand-pound cow should have one pound of concentrate, grain and meal for every three or four pounds of milk produced, according to this advice from the dairy extension department. Cows producing milk of high percentage of butter fat should receive a much greater proportion of concentrates. In addition to this feed one of the following is needed:

Thirty pounds corn silage and ten pounds hay.

Thirty pounds roots and fifteen pounds hay.

Eight pounds dried beet pulp (soaked for twenty-four hours) and ten pounds hay.

Twenty pounds clover or alfalfa hay.

Twenty pounds timothy, prairie or marsh hay with one or two pounds oil meal.

The following war-time concentrate mixtures for dairy cows to stimulate production are suggested by our dairy extension department.

(1)	Pounds
Corn and cob meal	100
Ground oats	200
Wheat bran	100
Oil meal	100
Gluten feed or dried brewer's grains	100
	600
Percent digestible protein	14.0
Per cent total digestible nutrients	77.5

(2)	Pounds
Ground oats	100
Wheat bran	100
Gluten feed	100
Dried brewer's grains	100
Oil meal	50
	450
Per cent digestible protein	18.0
Per cent total digestible nutrients	75.5

(3)	Pounds
Ground oats	100
Corn meal or barley	100
Wheat bran	100
Cottonseed meal	25
Oil meal	25
	350
Per cent digestible protein	13.1
Per cent total digestible nutrients	72.0

(4)	Pounds
Ground oats	200
Wheat bran	100
Oil meal	50
	350
Per cent digestible protein	13.4
Per cent total digestible nutrients	72.0

If any of our readers have experience with feeding any of these concentrates we will be glad to hear from them on the subject. Experience is the great teacher in these matters and conditions vary so that a hard and fast rule can't be set down.

Anoka Farms Short-horn Sale Sets New Values.

In the sale department of this issue will be found a complete report of the sales at the sixteenth annual offering by Anoka Farms, Waukesha county, December 1st. At this sale one animal brought $17,000, being the record price paid at any time in this country for a Short-horn bull calf. A total of forty-five head of calves and yearlings brought $69,000, or an average of $1,553 each. Eliminating the $17,000 top-price bull calf, the balance of forty-four head averaged $1,203.

Our first thought is to congratulate Mr. Frank W. Harding, of Anoka Farms, on the outcome of this record-breaking sale. But, as a matter of fact, that is taking entirely too narrow a view of the situation. Congratulations belong more to all those conscientious breeders of Short-horn cattle in the country, who must see new values for their breeding stock as a result of the record prices paid at the Anoka Farms' sale. Mr. Harding's sale is national and international in its influence. It is just as important to the beef world as was the record-breaking sale of a Holstein calf in Massachusetts last year to the dairy world. The great success of the Anoka Farms' sale may be attributed largely to the character of the breeding stock which Mr. Harding was able to offer. But in addition to this it reflects the attitude of Short-horn breeders throughout the country. It, in effect, sets new values on all good Short-horn breeding stock, no matter by whom such stock may be owned. It is because of this fact that the sale becomes of more than local importance and The Wisconsin Farmer is happy to record it.

Making Concrete in Cold Weather.

The great value of concrete is keenly appreciated by the man who handles live stock. Its use for feeding floors, for stable floors, mangers, sidewalks, etc., is well known and there are many farms where there would be considerably more concrete structures if men had the time to build them. During the spring, summer and fall months there is such a rush of other matters that building operations of this kind sometimes are neglected, while, on the other hand, building concrete in cold weather has not been the customary thing on the farm.

In his book entitled "Farm Concrete," K. J. T. Ekblaw calls attention to the fact that under certain conditions concrete construction work may be carried on during periods of freezing weather if proper precautions are taken. The thing to be kept in mind is that the concrete should not be frozen for a period of forty-eight hours after the materials are put in place, and after that time no harm can come from a freezing temperature.

Mr. Ekblaw calls attention to two plans of handling the concrete so as to prevent freezing. The first one is to lower the freezing point by adding ordinary salt. This plan can be followed when the weather is not very cold, but simply a few degrees below freezing. Ten pounds of salt to 100 pounds of water would prevent freezing at any temperature above 22 degrees F. Of course, it goes without saying that even though salt is used it is advisable to cover up the concrete for two or three days and for this purpose after it has hardened slightly nothing is better than barnyard manure. Many contractors do a great deal of winter building of concrete and adopt the plan of using salt and, in addition, some effective covering.

Then, of course, there is the plan of heating the materials as well as the water. By piling the sand and the cement around a half-cylinder of sheet steel and building a fire in same, the proper temperature can be easily reached. It is important, however, not to get too high a temperature, and Mr. Ekblaw suggests that the temperature should not exceed 150 degrees Fahrenheit. Even water should not be brought to the boiling point and 150 degrees Fahrenheit is high enough also for the water.

Attention is called to the fact that a certain amount of heat is developed during the setting and hardening processes and, therefore, when the materials, including water, are brought to the temperature referred to and the concrete is afterwards covered, there is every reason to believe that it will not freeze for a period of forty-eight hours and after that, as said before, it will be in good condition to set properly. Under ordinary conditions the concrete that is made and put in place without any heating whatever will increase from 70 to 100 or 110 degrees within thirty to forty hours if conditions are at all favorable. This fact should be kept in mind by those who have hesitated about building concrete in the winter, because the resulting product, although wet, will not freeze as easily as plain water.

There is no reason why sidewalks or floors cannot be covered with manure deep enough to absolutely exclude frost until the materials are set and unless the temperature is exceedingly low possibly the plan of using as much as 10 per cent of salt in the water will answer all practical purposes.

THE KICK-BACK WAS WORSE THAN THE KICK-OUT.

May Be Shortage of Farm Implements.

Those who are in a position to order now farm implements that will be needed next year should not delay the placing of their order, according to the advice given by the farm engineering department of the Kansas Agricultural College. The head of this department quotes a government official to the effect that no steel will be allowed to implement manufacturers except that which is reasonably sure of finding its way into some farmer's hands in the form of farm machines. This simply means that unless a manufacturer can demonstrate that he has an actual order for a farm machine he is not going to get the steel with which to make it. On this assumption manufacturers are urgently requesting that orders be placed immediately so a sufficient supply of steel is made available to meet the needs of the situation.

Every man knows whether he will need a new disk, a cultivator, a corn planter, a grain binder or any other implement. He knows it just as well now as he will four months later, and an order placed at the present time may be the means of making that much more steel available for the implement trade.

There is another matter to which attention is especially called and that is the putting into the best possible condition old machines that can be made workable with a few repairs and a little tightening up. It seems that railroad companies as never before have had to go to the junk heap and hunt out old operating equipment and put this in shape for use. If the railroads can carry out this program, then the same policy may be pursued with advantage by those who are apt to discard farm implements. December is going to be a busy month on the average corn-belt farm for the simple reason that considerable corn remains to be cribbed, but there will be times during the periods of bad weather even this month when attention may be turned to the implements, and there will be odd moments through the entire winter when it will pay well to tear down and build up again those implements that are not apt to stand the strain of next year's work.

The average farm implement lasts only a fraction of the time that it should last, because it is not given anything like expert care. We have frequently called attention to the case of a North Dakota wheat farmer who operated grain binders for a period of fourteen years, each binder cutting anywhere from 150 to 250 acres a year. In this particular case worn parts were renewed from time to time so that the binders did not shake to pieces, and as a result these binders will cut anywhere from five to ten times as much grain as the average binder on the corn-belt farms. Just as men with old automobiles are prizing them more today than ever before because there may not be enough new machines to go around next year, so should it be the case with farm implements, and every man should see to it without delay that his outfit will be in condition to carry him through the crop season next year without there being any lack of implements to do any part of the work.

Co-operative Spirit Growing

That coöperative movements in Wisconsin are making headway is shown by B. H. Hibbard in a bulletin "Co-operation in Wisconsin" just issued by the agricultural experiment station, Madison.

Wisconsin is a leader in agricultural "sticking together." Forty per cent of her dairy products are made in factories owned by the farmers. Live stock shipping associations have saved farmers from 50 to 85 cents a hundred pounds, a fact which accounts for the steady growth of these organizations all through the state. With a volume of business second largest in the state, the coöperative feed, elevator and produce companies have a prosperous trade.

To succeed in coöperation, the bulletin suggests that the farmers themselves should be the promoters. The stranger is too often working only for his fee.

Family Circle Talks by the Publisher

(Continued from page 3.)

that production may be increased; and to save, in order that all (fighters and stay-at-homes alike) may be fed. None of us must shirk this plain duty.

A WINTER OF CHEER.

I DO not know how many of my youthful readers can tell, off-hand, who said, "Now is the winter of our discontent." It is immaterial who said it originally, so long as it is not true now. I sincerely hope it will be untrue in every grain-belt farm home into which my words reach.

Why should such a thought enter the minds of any of us of the farm, as we sit by our own fireside, with our loved ones by us, a good book within easy reach, a plate of Jonathan or Grimes Golden apples on the table, perhaps a skilletful of corn popping on the kitchen fire. The fireplace is no longer a sign and symbol of the country home. We have discarded it for the less picturesque but rather more certain register and radiator—cold iron until the heat from the furnace below warms it into being. But because the open hearth has passed shall there go with it the customs which made for merriment, which drove away the discontent from the winter, which made the poet sing of country life in preference to all other?

The husking bee has been revived in many parts of rural America. The red ear still demands its osculatory forfeit, to such an extent that some young Lotharios of the furrow and feed lot have been accused of intentionally painting many an ear of Reid's Yellow Dent a burning crimson before the girls arrive. This may be a base libel; the kisses paid in forfeit are genuine enough.

Let's have a winter of old-style cheer; certainly discontent cannot hold forth against a revival of the customs of our fathers. There's a set of sleigh-bells in many an attic and barn; there's an old-time song book by many a discarded organ; there's a genius in every farmers' neighborhood club who can get up a program of riddles and charades, of anagrams and conundrums; with songs of the days of "Juanita" and so on and on. The "winter of our discontent;" pshaw, spring will be here before we know it—or want it.

Come on now; it's been a long time since I heard a bashful youngster recite "The Smack in School" or "Juanita, be my own fair bride" dragged over a shoal of flats. The winter is here, the snow may be piled high; what of that? It is a time to be merry and here's the best place in all the world—the farm home—ready for it.

THE BOY THAT IS GONE.

I WANT to thank Mrs. George Smart, of North Prairie, Wis., for writing me a letter which gives me an opportunity to present, right in line with her letter, a little poem which I consider one of the best I have run across in my newspaper reading for some time. Mrs. Smart raises the question that we must not confine our sympathy wholly to the mother of the boys who are taken from our farms to become soldiers of Uncle Sam, that the father needs our loving pity just as much. She writes me as follows:

Dear Mr. Pierce: Much sympathy is expressed in these war times for the mothers who have boys in training camps or in France, and it is right that it is so. But what about the fathers? Do they not feel as keenly as we do? I think they do, though, being the stronger, perhaps they can control their feelings better. Our oldest son went to a western camp in September and I assure you his father felt the parting as keenly as I did. And I know that when he is working in the field or about the chores his thoughts are with our boy. Everywhere about us are reminders of our boy—pictures of him, his letters to us from camp, pictures of parts of the camp and many other things. But the hardest of all was when his clothes that he wore when he left us came back from camp. Father tried to comfort me, but I noticed his tears flowed as freely as mine.

Because a man is made of a little sterner, perhaps coarser, stuff than a woman is no reason for believing that his heart is not touched just as much when the boy goes away to the colors; that his tears do not flow just as freely (usually when there is no one looking), or that his heart does not ache as much. I could write my opinions on this subject for an hour, but the little poem I have in mind gives you the whole thing. It carries me back to 1898, when I sent my own boy away to the Spanish war, and watched and hoped and prayed for his return. I am sure it will strike a responsive chord in the hearts of many of my readers, just as it does in mine. I clip it from a newspaper; it is well worth preserving in all our scrap books:

Our last sight uv Bill wuz jest his back,
Far off in th' distance, beneath his pack.
Couldn't go t' th' train, his mother an' me,
A-makin' it harder fer Bill, y' see.
So we stood on the sidewalk, an' watched 'em go—
Shoulder t' shoulder an' row on row.
Bill couldn't speak, but his head wuz high,
Ez he gave us a look an' waved "Good by."
An' I couldn't help feelin', ez fathers will,
"Ef it only wuz me—instead uv Bill!"

We didn't say much, at supper, that night,
An' mother seemed older—more feeble an' white,
But she stuck it out, somehow, ez brave ez could be;
Never thought uv herself, but allus uv me.
Then we seen in th' papers where Bill'd reached France,
An' off t' th' front, at th' very first chance.
It told how th' Frenchmen thanked God, on their knees,
When the Star Spangled Banner flew out on th' breeze.
Still I couldn't help feelin', ez fathers will,
"Ef it only wuz me—instead uv Bill!"

An' so it ran on, with a word now an' then,
That told us uv Bill an' th' rest uv th' men.
An' mother seemed older—more feeble an' white,
As we'd read in th' Bible a chapter at night.
Th' thing 'at hurt most, though, wuz Bill's empty chair,
Drawn up t' th' table ez if he wuz there.
We know he'll be back, when th' world is set free,
An' we'll all be together—Bill, mother an' me.
But I allus keep praying, ez fathers will,
"Fergit 'bout us, God—an' look after Bill."

Many and many a boy from the farm will never come back to his waiting parents; the chair still drawn up to the table will never again be filled. But in the hearts of every one of us there is a great hope, a great longing, a great faith. It is summed up in the words of the poet, the heart-aching prayer of the father, just such a father as you and me:

"Fergit 'bout us, God—an' look after Bill."

James M. Pierce

BADGER FARMER'S MAIL BAG

FARM EXPERIENCES

Pedigreed Rye the Best.

To the Editor:—Winter rye is a popular crop in our neighborhood here in Adams county and is grown on the sandy soils. The samples of winter rye, which won prizes at the last grain show of the Wisconsin Experiment Station at Madison, were taken from fields sown in September, on plowed ground sown at the rate of one-half bushel to the acre with a disk drill and top dressed with manure in the winter and this field yielded twenty-two bushels to the acre. While, of course, this is no great yield, it is above the average yield of common rye, which is twelve to fifteen bushels per acre, and shows that the pedigreed winter rye seed pays. With the increased yield and price it can easily be seen what it means to the grower and there should be more of this pedigreed seed sown so that we might improve seed grains just as we are endeavoring to improve the breeds of live stock. I wish to say in this connection that too much praise can't be given to Prof. R. A. Moore for his work with improved seed grains and also it would be to much advantage for every farmer in this state who can possibly do so to attend the grain show each year at Madison.

Adams Co., Wis. E. D. Cook.

Saving Corn From Frost.

To the Editor:—I have been thinking for some time about writing a letter for The Wisconsin Farmer Mail Bag, as I believe I know a few things about growing corn and I like very much the idea of us farmers talking these matters over in the paper. First of all, I will not plant so much white corn or Wisconsin No. 7 because it is much heavier corn than the Yellow or Golden Glow, known as Wisconsin No. 12. On this account it gets ripe about two or three weeks later than the Yellow. I only plant enough so that I can get it for seed or enough to take to the show. In the second place, every farmer should plant a half acre or a whole acre as soon as he can or as soon as the weather permits so this can grow right away providing the season is favorable. He should not wait until all the corn can be planted, as some farmers do who think they must prepare all the land before they can start to plant corn. Then by the time they are ready to plant it will be two or sometimes three weeks later. Now you take the kind of weather we had last summer every possible growing day is needed for the corn to mature. Nearly every farmer has got a piece of land handy, say a half or a whole acre, aside from his big piece of land which he expects to put in corn and it really doesn't take much trouble to plant this before the rest is planted. I feel that it is very wise for the farmer to plant a little patch like this on the south side where the sun can strike it, especially if it is in a coulee. If this small patch does not get ripe, I suggest following out the plan of picking out early in September when it looks like frost, stalks with good ears and bend them over until they touch the ground. I did this on the 10th of September this season and the ground was soft and wet and the stalks gave way easily. After I had them laid down I covered them with grass and straw and they did not frost a bit. The next day it was warm and I had dodged the frost all right and it kept warm for almost four weeks. I took off the grass and set the stalks straight up again with a pole and this corn got dead ripe. I have some seed now from this corn. I consider that some of these are the finest prize ears I have ever seen. Any farmer who has sandy soil or soft soil can do this so that they can be sure to have seed for themselves. I recommend planting more Golden Glow corn than No. 7. Three years ago when we had good weather for corn I had some great ears. One of them won for me the sweepstakes for corn at all the corn shows and I loaned it to one of the large seed houses to make a picture for their catalog. If we could get weather like we had then, we could always grow fine corn in Wisconsin. The seed house which took the picture of my sweepst[illegible] erable [illegible] sell an[illegible] no trou[illegible] corn if [illegible]

Vernon Co., Wis. John Bendel, Jr.

Believes in Shallow Planting.

To the Editor:—I don't know that I have noticed anything about raising corn the past two or three years that would be new to others, but I have noticed a few things that I expect to follow up in the future. One thing is that I have been planting my corn too deep; I find by planting it just as shallow as I can so as to have it covered, even leaving some in uneven places uncovered and covering them afterward with the hoe, then it is near the surface where it will warm quickly and start to grow while those deeper down in the cold soil haven't even sprouted. Another thing is that I have been planting the corn too thick. I find by having the seed ear-tested I can use the small plate in the planter and by having fewer in a hill the corn matures quicker and have larger and better-filled ears and you have to hunt a good while to find a missed hill. So altogether you have better corn and just as much of it by using the small plate. One other thing I might mention is planting some at least of a very early variety, such as Wisconsin No. 8, and you will almost surely have some to put in the crib. A. N. Kelly.

Iowa Co., Wisconsin.

[P. S.—In answer to Mr. Oelk's inquiry, I plant my winter wheat in the corn stubble after the corn has been taken off for the silo. I either cultivate it in with the seeder and then harrow it or follow the seeder with the disk and then harrow. The past season I raised about forty bushels per acre on three acres, put in on the above plan, and then considerable of the ground was missed by winterkilling.—A. N. K.]

Barley in Richland County.

To the Editor:—Now I have had some experience growing barley, two-rowed variety, also hulless and Pedigree No. 5. I find the Pedigree No. 5 is the most profitable kind to grow. Barley in this part of the state should be sowed on ground that has a slope. Plow your ground in the fall and in the spring give a good disking, harrow and plank before seeding. Be sure you clean your grain with a good fanning mill. Also treat for smut. [illegible] with a drill then plank with harrow. It won't hurt the barley even when sprouted. Barley should be cut a trifle on the green order, as when ripe it gets yellow very easy. Also make long shocks and stand them north and south so as to get sunshine on both sides. This will dry them out quickly. Stack as soon as possible so as to get a good color. This is the way barley is grown at the Wood Lawn Farm, which yielded fifty-two bushels per acre. H. T. Draheim.

Richland Co., Wisconsin.

Eight Boulders for 50 Cents.

To the Editor:—It doesn't cost a great deal of money to blast boulders with dynamite if a man is willing to load his charges. I think the following figures will prove this:

Recently I broke up eight large boulders for Mr. Thomas McFarlin, a neighboring farmer, with three-fourths of a pound of 40 per cent dynamite, eight blasting caps and four feet of fuse. The total cost of the explosives was but 50 cents.

I believe that if more farmers knew how cheaply boulders could be disposed of there would be fewer of them left in the fields to break plow points and harness. Henry Ruzek.

Wisconsin.

Some Stump Blasting Costs.

To the Editor:—There are a great many settlers in this part of the country who have stump land to clear. They are anxious to know what the work should cost. As I have had a great deal of experience in clearing land, the following record of my costs on a recent small job may be of interest:

I recently blasted thirty-four green stumps for Mr. Hoff. They were basswoods and elms. I used altogether seventy-five pounds of 40 per cent dynamite, twenty pounds of 60 per cent dynamite, thirty-six electric blasting caps, and did the work in a day and a half. The total cost of the explosives was $27.75. Henry Ruzek.

Wisconsin.

Forward in the Dairy Industry

After Forty-Six Years of Service Wisconsin Dairymen See Brighter Future —By Noel Negley.

WHEN a man becomes forty-five years old he generally looks around, counts his children and his resources to decide if after all he amounts to much or if he is likely to ever amount to much. To many this is a disappointing and critical period, but to the Wisconsin Dairymen's Association, recently celebrating its forty-sixth birthday at Janesville, it is an event full of pride and happiness. This association enjoys a large and happy family and a verdict from the people of Wisconsin —"Well done, thou good and faithful servant." Its children have been many and their influence great, yet the father association is in good condition to tackle with strength and enthusiasm the many problems confronting the dairy farmer. That first stalwart son born in 1889 was the dairy and food commission, then the dairy school in 1890, soon thereafter in 1892 came the cheesemakers' association, then in 1901 the buttermakers' association, and at last in 1908 was born that favorite daughter—the cow-testing association, which has now eighty-three boys and one girl in the local associations of the state.

On November 21st the Wisconsin Dairymen's Association and the University of Wisconsin announced the birth of a new movement whose name was decided many weeks before as the "Register of Production," and whose destiny is to aid materially in the advancement of the dairy cattle interests of the state. This Register of Production will give publicity to the cows in Wisconsin cow-testing associations that are capable of running the 365 days' race at the average rate of at least one pound of fat a day. It is expected to promote the purchase and sale of cattle on a basis of production, and to increase the interest in better methods of feeding and breeding dairy cattle.

The future of the present dairyman depends on his efficiency in the management of his business, for that stern law of the "Survival of the Fittest" is in action. A strong back and a good arm are essential in every line of work, but the dairyman of today must make use of certain other portions of his anatomy if he survives. Yet, some use all the anatomy that God gave them and then do not succeed. This is often because they work alone without the coöperation of their neighbors and without modern machinery. It was because man became dissatisfied with himself and his progress that he threw away the corn knife and bought a corn binder, he lost the old cream ladle and found a cream separator, he discarded the flail and discovered the threshing machine, he fired the inefficient hired man and may have hired a milking machine, he killed the "slacker" cows and is now raising "patriots," and he used to "guess," now he "knows." The cow-testing association makes for efficiency in man and beast; in fact, the dairyman of today can hardly be efficient without it.

The greatest hindrance to efficiency in dairying is the inefficient cow, and in the battle for increased profits from the business the cow testers of the state have concentrated their fire on the "boarder" cows.

In this battle there are no guns, no grenades, no gas, simply the quiet testimony of the feed record, the milk scale and the Babcock tester. The tactics of the testers who conduct the offensive consist of monthly observations extending over a period of one year, the attack usually being made from a position near the right "flank" of the enemy.

During the past month George Springer, tester for the Dodgeville association, made the greatest gains of any of the eighty-four captains, for he reports the capture of seventeen unprofitable cows. The Wolf River association follows closely with fourteen prisoners, Shawano county with thirteen, Muscoda with twelve, and so on, making a total of 174 captured cows now being "canned" for the boys waging another type of battle "over there."

In the great war "over there" some must sacrifice their lives, others are giving their arms, legs, lungs, sight, hearing or health that we who remain at home may be safe. But the dairyman as a food producer has a great responsibility and a great opportunity to serve his nation. That his work is of importance is shown by the recent classification under the selective service law in which the "heads of necessary agricultural enterprises" are placed in Class 4, next to the last in the classification.

During the past month the man in Wisconsin that produced the most food per cow is Wilhelm Hohenstein, of the Alma Center association. Each of the cows in this herd of fourteen grade Holsteins, headed by a pure-bred Holstein bull, produced an average of 966 pounds of milk and 38.5 pounds of fat in the thirty-one days. If we had more herds like this one belonging to Wilhelm Hohenstein we would not need to worry so much about one Wilhelm Hohenzollern.

In the race for highest butter fat production last month, E. R. Race, of the Winnebago County Association, won the race. He won, not because of his name, but because last year he had the nerve to sell a lot of his lowest producers and replace them with better producers, and then determined to give the whole herd a chance to make good. His six-year-old pure-bred Holstein made the most butter fat of any cow in the association of the state by producing 86.7 pounds of fat during the thirty-one days. We will be interested in seeing what this cow can do in 365 days, for all of the 41,200 cows are entered in the distance races.

Only those who know of the perseverance and doggedness of the allied soldier can appreciate the force of their expression to "carry on." A few dairymen with low-producing herds and poor crops and possibly poor management have become discouraged. The dairyman must "carry on," and it is the duty of the cow-testing associations to make it easier for him to "carry on." During the past month he was aided in many associations by the coöperative purchase of feed in car lots, nineteen cars of feed having been ordered last month, 135 tons of which were purchased by the Winchester association, Alma Center getting three car loads, Amherst & Nelsonville one, Chilton one, Granton two, Marshall one, Shawano one, Walworth two, and the Waukesha Guernsey one. To "carry on" in the business as he should at this time it is necessary to use only the best bulls possible. During the past month eighteen pure-bred bulls were bought, two of which were to replace grades and three to replace scrubs.

Some of our testers have been reading the Bible lately and find they have many people in their community "who having eyes, see not, and having ears do not hear." They find defective hearing especially prevalent, and are trying to appeal through the other senses.

George Springer, tester at Dodgeville, is now sending out a letter each month to members and other good dairymen dealing with various problems of interest to them, especially that of feeding. H. R. Brewster, tester at Scandinavia, has rented a show window in the town of Scandinavia in which will appear exhibits to attract the attention and win the interest of dairymen to the necessity of cow-testing association membership. M. E. Smith, tester of Alban & New Hope Association, is apealing to the eye and the ear through the use of lantern slide lectures, the picture being made of local views and the lectures his observations of the different practices and their results on the dairy farms of the members.

The third annual convention of Wisconsin testers and members of cow-testing associations will be held at Madison during Farmers' Week, February 4th to 9th. The two previous conventions have been of much value to all who could attend and it is expected, with eighty-four associations and 2,500 members, that the coming convention will be the "best ever." If you keep cows or have cows that keep you, be there.

Evangelists insist that when argument and reason fail, personal testimony may win the "unbeliever." If you are a non-member or "unbeliever" in cow-testing association work, will you listen to the personal testimony of these "believers?"

"I was never sorry that I joined the association, but I would not take $100 to be out of it now."—Sever T. Lee, Black Earth.

"The cow-testing association not only makes more money for me, but makes my whole family interested in dairying."—J. C. Nielsen, Bone Lake.

"The cow I was planning on selling before I joined the association has proved the second best in my herd."—Peter Ermire, Cedar Grove.

100-ACRE FARM

IN TIOGA CO., N. Y.—Farm lays good; clay loam soil; produces as much as any land in the Northwest. 90 acres under plow. Creek-watered, natural grass pasture; big markets; lots of all kinds of fruit; good water; healthy climate; mild winters; good 8-room house, big basement; telephone; 2 big basement barns; ice house, hen house, hog house; half mile to school; close neighbors; on good road; R. F. D. Price, $2,500, $1,000 down, easy terms. A. L. WILKINS R. 1, Union, N. Y.

Land Clearing Costs and Methods.

Information Gathered in Land Clearing Work Conducted by the State of Wisconsin—
By L. F. Livingston, Wisconsin Station Engineering Staff.

LAND-CLEARING costs should be reckoned by the stump and not by the acre. Up to the present time when anyone mentioned clearing it was in terms of acreage; that was the unit for determining cost, and that is the big reason why today there is little or no real data on the cost of land-clearing work. There has been a great deal of clearing done in the last ten years and by now there should be a lot of available material published, but the fact that every farmer told his neighbor that his clearing amounted to so much an acre is the cause of so many misleading statements that naturally amount to nothing. Even now the inquiry comes, "How much per acre?" It can't be answered; at any rate, not directly. There are too many factors which have to be taken into consideration beside the extent of the land to be cleared.

Stump Piling With a Home-made Piler.

A Land Clearing Demonstration Crowd.

Every field of cut-over land is covered to a greater or less extent with stumps. These are of various kinds and of various diameters. They are in all stages of decay, and there is a large variation in the number per acre. Besides this, the soils on which they grew may be different, and that alone has a decided effect upon the cost of clearing. So it is easily seen that to state the cost of clearing one should mention all of the above divisions—then there is some basis of comparison.

In the investigation carried on by the state through the college of agriculture, all of these points and several more were taken into consideration. The Land-Clearing Special was conducted from an engineering standpoint and the data was tabulated by experienced men. Eighty per cent of the cut-over land of Wisconsin was at one time white pine forest, so it is natural that most of the work should be done on the eradication of the white pine stump. White pine stumps have great lasting qualities; this fact, though it may not be obvious, is one which enables the stump remover to determine more easily the cost of removal. If a stump is solid there is some chance of knowing how it will act; if it is decayed or rotten, there are no rules which will cover its actions. Thus the problem of cost is somewhat narrowed, as the age of the stump needs only to be considered in a general way.

White pine is of the lateral rooted variety and can be pulled rather easily in comparison to some of the other kinds. But even so, it may be a question as to the best method of pulling and there then comes in a factor, the soil. There are three general classes of soil, clay, loam and sand, and each one affects the root system of the white pine. In the lighter soil, the roots go deeper than in the clay, but they can be pulled cheaper because the clay clings to the stump, while in sand the roots come out clean.

A Horse Power Puller at Work.

This One Will Have to be Cracked.

Speaking of pulling is not to convey the idea that it is the best method of working, for, while in some instances it may be the most economical, another method in most cases is by far the better. The combination use of the horse stump puller and dynamite has proven to be the most economical method in the great majority of the fields that were covered in the upper part of the state. The best type of stump pullers will pull any size of stump, but that is not economy. Why take the time to set power pulleys and extra chokers for the increase of power necessary to pull the large stumps when a small charge of dynamite will break them up in such a way that they can be pulled with a straight line? If the stump is set on the top of the ground or is very shallow rooted, quite often it can be pulled with a single line, but what can be done with it after it is out? To handle such a stump and burn it becomes quite a task. This is also overcome with a small charge of dynamite placed under the center of the crown of the stump, which cracks the stump and knocks off the dirt so that it becomes a simple matter of disposal. White pine pulls easiest from a sandy soil, next from a loamy soil, and considerably harder from a clay soil. The reason for the greater difference between the loam and clay is that the clay not only holds the stump from being pulled, but also sticks to the roots after it is out and increases the cost of disposal.

The one-man stump pullers or rather the man-power stump pullers have had an important part in the land now cleared in Upper Wisconsin. They undoubtedly will pull stumps, as the machine multiplies a man's strength a good many times, of course, at the expense of speed. These machines operate economically in swamp ground where a team would become mired. For the man who has little money the hand-power machine will do good work. Most hand-power machines are best operated by two men, one on the sweep and one with a mattock knocking the dirt from the stumps being pulled. These men, changing jobs every so often, work economically.

If the stump puller alone may be economically used in some places, dynamite may be used in a great many more. For the man of small means who cannot combine with his neighbor to buy a machine, the use of dynamite is economy. For the man who has a field where the stumps are scattered, dynamite is the answer. On a heavy clay soil where the land is damp, dynamite will run a close second to the combination method. Why? For the answer, it is necessary to go into explosives just a little. All explosion is primarily an expansion of gases. Gas expands in all directions; in sand, the force of the blast diffuses through the air spaces between the sand particles, while in clay, especially when moist or wet, there are fewer interstices, and the force of the blast goes through the stump to the atmosphere, taking the stump along with it. It is always better to blast when the ground is damp, and this condition is most prevalent in the spring of the year. The state passed a bill enabling anyone to buy dynamite at cost through them. Definite information may be obtained from A. J. McAndrews at the capitol in regard to when and where to get this dynamite.

The hardwood situation is somewhat different from the white pine in that there are a great many varieties of stumps having different types of root systems. Besides this, every year causes some change in the texture of the stump; in other words, the rate at which a hardwood stump will rot is so much greater than that of the pine stump that each year causes a decided difference in method and cost of removal. With these facts in mind, it is noted that a vast amount of data must be gathered before any exact conclusions can be drawn. However, it is safe to state that where possible it is cheaper to let hardwood stumps stand for five or seven years, or until they are very rotten. Then with the aid of a little dynamite they can be plowed out. While the stumps are rotting, the field makes a very good pasturage, especially for sheep, which are fast becoming a factor in the productions from Upper Wisconsin.

There are two main steps in land clearing, one is getting the stump on top of the ground and the other is getting rid of it after it is out. Few appreciate that this second step is almost as important as the first. In fact, the piling and burning is fully 40 per cent of the work. This is not hard to [illegible] consider that [illegible] pose of. In the ne[illegible] organize some method of handling t[illegible] vast amount of waste—and it is wasted at the present time. But that is getting ahead of the game, the main thing at present is to eradicate the stump as soon as it is out of the ground. There are several ways in which this can be done, and, though peculiar, several of them may be correct. In some instances, say jack pine, which grows in a sandy soil, the stumps are small and can be handled very nicely with a team, the method is to stand all the stumps on end with the roots in the air in as compact a body as possible. They will dry in a short time and burn with ease. This method will hardly hold good for any other type of stump, and a good many people make the mistake of trying to make similar piles of the white pine. The large white pine stumps are the hardest to burn and the worst to handle. The old method was to make small piles usually around the big stumps, but that does not burn the old

Blasting a Stump With Dynamite.

timers unless it is constantly watched and chunked together taking too much time to be economical.

The modern method is to use a piler, since with a piler the stumps can be placed in a high pile. The higher pile generates more heat, and even large green stumps will be consumed. These pilers are of different types and sizes. Some are operated by horses and some by gasoline. Of the horse machines, the homemade Conrath piler gave the best results. This machine can be built for about $50, not counting the labor of putting it together. The plans for it may be obtained from the University of Wisconsin agricultural engineering department. There are some gasoline machines on the market which do excellent work, but we do not have information to compare them with the horse-power machine. The horse machine is worked to an advantage with three teams, two hauling stumps within reach of the piler and the third team on the cross haul. This system works best where the haul is over 150 feet, and in average fields a pile every 300 feet will work out to the best advantage. Where a longer haul is necessary the cross haul team can be used with the others part of the time hauling in. Using a horse machine, a pile can be built twenty-five feet high with as large a base as is necessary.

The exact figures on the cost of clearing white pine stumps on all types of soil in all conditions will be given in a bulletin which is being compiled as a result of the investigations this year. The land-clearing office of the agricultural engineering department will be glad to advise as to methods for individual cases when the proper information is at hand. The number of acres and the kinds of stumps is not enough, but a blank questioneer can be obtained which contains all the questions that need to be answered to show conditions.

More Discussion of the Sheep Situation.

There is a strong demand for more mutton and wool and at present prices sheep production offers good opportunities. Land is available at reasonable cost of rental prices. Sheep can be bought and established flocks bred and reproduced to a good advantage.

Men in northern Wisconsin are successfully and profitably taking advantage of this opportunity.

Follow a plan that adapts itself to Upper Wisconsin sections and one recommended by men experienced in the business. The following suggestions have been made:

Choose land from which the timber has been removed and that has been burned over and well seeded to grass. Too much green brush and too many trees in the pasture prevent the production of first-class mutton and may result in failure.

Seed burned-over land to timothy and alsike; it hastens the production of an abundance of grass.

Sheep keep brush from growing and eat many weeds. They assist in clearing land of brush, but it takes good grass pasture to produce profitable mutton.

Choose land that is more or less rolling and hilly. Low, wet land is not adapted to sheep.

Consult men who "know the game." Either the Wisconsin Sheep Breeders' Association or the Wisconsin Live Stock Breeders' Association, Madison, represent these practical flock masters. Ask to be placed in communication with them.

Buying sheep in the spring when the prices are high and fattening and selling them in the fall cannot be recommended as a money-making undertaking, even though the sheep fatten well. The general practice where the business is at all extensive is to buy ewes in the fall, breed them to the best mutton type rams, have them lamb late in the spring, the last of April and early part of May, and keep both ewes and lambs grazing through the summer on luxuriant pastures.

Buying lambs or wethers in the early fall and fattening them on excellent pasture, like clover, rape or cornfields, or feeding them later on grain and suitable roughage is a feeder's practice which has made money for those understanding the methods of buying, feeding and selling successfully.

Sheep do not require warmth except at lambing time. Having ewes lamb early in May makes it unnecessary to provide expensive shelter. Sheds or barns that keep sheep dry and offer protection against winds and cold drafts are all that is necessary in the sheep industry. Buildings that supply sufficient storage space for hay and other feed necessary for winter feeding are desirable.

Good clover hay, cut when just coming into full bloom and fed night and morning, in quantities that sheep will eat without waste, in addition to two to two and one-half pounds of rutabagas a head daily, provides ample and suitable feed for breeding ewes up to within a few weeks of lambing time. Good silage may be substituted for roots. Alfalfa or mixed hay, pea and oat hay, all constitute roughages that are fed more or less.

A grain mixture consisting of two or more feeds like oats, bran, peas or barley are suitable for ewes as they approach lambing time and until they are on the best of pasture.

Fencing may be regarded as one of the necessities for successful sheep production. Woven wire twenty-six to thirty-four inches high with one wire on top makes a good fence for pasture. Brush fences may be utilized, but they are expensive in labor and subject to being destroyed by fires. A suitable yard or corral should be fenced in a manner to be dog proof. The dog has been a menace to the raising of sheep, but the menace is overcome by always corraling the sheep at night in dog-proof yards or stables.—[Wisconsin Experiment Station.

Wisconsin Dairy School Alumni, Attention.

Former members of the Wisconsin Dairy School no doubt will be pleased to learn that arrangements have been finally perfected by which the dairy school has come into possession of a handsome piano. For some time a fund has been accumulating in the treasury of the association and for the last two years liberal contributions by the classes were made. The present class has also generously contributed and the dairy school students are now in possession of a nice musical instrument which adorns the lecture room in the dairy building. It is the source of a great deal of enjoyment to the members of the class.

Another point that some of the members of the association may be pleased to know is that we have on hand extra class pins of the years '09, '10, '11, '12. Many students purchased their class pins while they were at the school, but some were not financially situated so that they could do so. It may also be that some members of these classes have lost their pins and would like to replace them. We are offering these at the original price, viz., $1.25 apiece. If anyone desires a pin, kindly write the secretary.

Our country is now at war and almost daily we hear of former students that have responded to the call. We would like very much to have the names of such members as are already in the service sent to us so that we can give them due recognition. Possibly some readers know of former students who are now fighting for our country and if such is the case we would be pleased to have them write us. We want the boys who are going to the front and sacrificing so much for us back at home, to feel that our hearts are with them and that we will honor them in every way we possibly can.

Let every former student or others interested write us as soon as they have information concerning our men who have gone to war so that we may have their names for our dairy school war service flag. G. H. Benkendorf. Secretary Wisconsin Dairy School Alumni Association.

Prepare to Increase the Number of Hogs.

To the Editor:—This means hold on to the present good and reliable brood sows, and possibly double the number now on hand for pigs next spring. From now on to the close of the war, and for some years afterward, the price of fat hogs is bound to be exceedingly high. Even if the government shall be obliged to set the price, it is going to be a good one. Hence, all farmers should enter into hog growing and fattening on a grand scale. Such a course at this time will result in much profit to the farmers, and the people of the world will be able to secure the meat and lard that are now so badly needed.

The main reason the writer urges farmers generally to widen out in hog growing is a patriotic one. The vast armies of the allied nations against the German and Austrian powers must be fed. Good, wholesome meat is very necessary as a fair portion of soldiers' rations. While American farmers are producing meats in general, and pork and lard in particular, they are doing a patriotic act, and will get big pay for all their expense, care and trouble.

The exceedingly high prices of hogs that have prevailed, and will no doubt continue for an indefinite time, have had a tendency to induce far too many farmers to market too much of their breeding stock. This they cannot afford to do. On the contrary, as mentioned, it will be better to largely increase the number of brood sows for next season. W. A. G.

A well-filled silo, a barn full of alfalfa and enough dairy cows to consume the feed grown on the place make a pretty good foundation for a bank account.

Many home owners owe their happiness to Curtis Service

Are you held back from owning a beautiful home for fear of the cost of building and furnishing it?

Of course, no good house can be built at fire-sale prices, but there is a way to get absolutely the most and best possible for your money. Right now, farm products translated, through the medium of money, into building materials will go further than ever before. Build NOW!

1866 CURTIS WOODWORK

"The Permanent Furniture for Your Home"

Get a copy of one of the Curtis home books and select your plan. The home shown here is selected from one—"Better Built Homes," Vol. II—with homes costing $3150 or less. "Better Built Homes," Vol. III, shows homes costing $3150 and up. Send the coupon for the book you want.

Go to the Curtis dealer and get him to figure on the cost of the home you want. Have him show you the big Curtis catalog with its hundreds of designs of CURTIS Woodwork. Select standard designs, that go well with the style of house you want. Pay attention in particular to the built-in features of CURTIS Woodwork.

All CURTIS Woodwork, even a single door or window, is painstakingly designed, carefully and skilfully made. Every piece is stamped CURTIS. Use it in your home, and you can be as justly proud of your woodwork as you are of your sterling silver.

When you have decided on just what you want, the Curtis dealer can help you with the detailed plans for your home. He will maintain an interest in your home until you move in and find it satisfactory.

Then, this is the way to build and furnish the best possible home for a certain sum of money. Will you accept this offer of our service and the personal service of your local Curtis dealer?

Milk By-products in Hog Raising.

John M. Evvard, Iowa Experiment Station, Compiles Data for State Board of Agriculture.

HUNDREDS of letters are received annually inquiring as to the value of skim milk or buttermilk for pig purposes. Now skim milk and buttermilk are of about equal value, both being of practically the same composition and both giving approximately the same results in feeding experiments. The whole milk is skimmed once to get the skim milk, but buttermilk is really what is left from the second skimming. The cream is taken from the whole milk and then the butter is taken from the cream—in reality the practical equivalent of skim milk is left as buttermilk in the churn. In truth, we now make practically all of our culture buttermilks which we buy at soda fountains through the use of skim milk, one of which is particularly famed, namely, the Bulgarian buttermilk, a skim milk bacteriological product.

The old rules proposed years ago in order to find out the value of a hundred pounds of skim milk hardly cover the issue nowadays, although they have proven useful in their time. Two of these rules are particularly interesting, the one by Hoard given by Henry and Morrison is as follows: "To find the value of 100 pounds of skim milk when fed alone, multiply the market price of live hogs in cents per pound by five; if fed in combination with corn or barley, multiply by six." On this basis the money value of 100 pounds of skim milk with $10 hogs is 50 cents; $20 hogs, $1. In reality, though this relationship is based between pounds of skim milk and price of hogs per hundred pounds there is very little relationship between the price of hogs and the value of skim milk; this will be shown shortly.

The Gurler rule runs as follows: "The value of 100 pounds of skim milk when fed along with corn to fattening hogs is half the market price of corn per bushel." On this basis, therefore, the value of 100 pounds of milk is 50 cents with $1 corn, and $1 with $2 corn. This relationship, therefore, is on the basis of the price of corn rather than the price of hogs.

In order to determine the value of skim or buttermilk we have done considerable work with buttermilk, and the figures secured are applicable to skim milk.

In an average of four trials in which buttermilk was fed in limited quantity, from two to ten pounds per head daily, to young growing and fattening shoats this section has found that a hundred pounds of buttermilk replaces six pounds of corn and six pounds of meat meal tankage. The tests were run in this way: One group of pigs was self fed on corn and tankage "free-choice" style; another similar group out of the same dams and sire was fed exactly the same ration with the exception that they were given some buttermilk daily. Naturally when they got the buttermilk they would hold up on the corn and tankage.

Physiologically their demands were different with the buttermilk in their stomachs and alimentary tract than where it was not present. By figuring we arrive at the above deductions, namely, that 100 pounds of buttermilk saved six pounds of corn and six pounds of meat meal tankage.

Pricing the corn at $1.68 a bushel or $60 a ton the corn replaced is worth 18 cents and the tankage replaced at $80 a ton is 24 cents, making a total replacement value of 42 cents, hence 100 pounds of buttermilk in these particular experiments were worth 42 cents a hundred pounds. As corn and tankage go up the buttermilk becomes more valuable; as corn and tankage go down it becomes less valuable.

Had these tests been run today and the buttermilk figured on the basis of the above rules the values would be much in excess of 42 cents or with the Hoard rule almost twice as much or about 90 cents; with the Gurler rule, counting the corn at $1.68 a bushel, equals 84 cents or exactly twice the value found. It is readily to be seen, therefore, that buttermilk is worth the price of materials necessary to replace it if buttermilk is not used and corn plus tankage replaces buttermilk.

Let us go further with this proposition and see the effect of feeding buttermilk (remembering always that when we speak of buttermilk we might as well speak of skim milk) in large quantities, giving young growing pigs of fifty-six pounds weight all the buttermilk they possibly can drink, keeping it before them continuously until they reach the weight of 300 pounds. Two groups were fed. Group 1 received shelled corn self-fed plus 60 per cent meat meal tankage self-fed plus wheat middlings self-fed plus rock salt self-fed, all feeds allowed "free-choice" style in separate feeders. Group 2 was fed exactly the same excepting that buttermilk was kept continuously before them in addition to the other feeds.

And how the buttermilk pigs did gain! They relished the buttermilk, coming as it did from the college creamery where the cream before churning was thoroughly pasteurized, thus eliminating disease-producing organisms. The following table shows the number of days required to reach the weight of approximately 300 pounds, feed eaten, gains made and feed required for 100 pounds of gain:

BUTTERMILK VERSUS NO BUTTERMILK.

Record heading	Group I	Group II
Final weight	296	299
Number of days	218	156
Average daily feed eaten:		
Shelled corn	4.87 lb.	2.27 lb.
Meat meal tankage	.37	.14
Butter milk	....	32.16
Wheat middlings	.34	.22
Rock salt	....	....
Average daily gain per pig	1.10	1.54
Feed required for 100 pounds gain:		
Shelled corn	422	148
Meat meal tankage	33	9
Wheat middlings	31	14
Buttermilk	....	2091
Rock salt	.4	.1

Note that the buttermilk pigs made the most rapid gains, reaching 299 pounds in 156 days. It took the "no buttermilk" fed pigs sixty-two days longer to reach 296 poun

Note further that the
the average a little o
pounds of buttermilk
day, and that they ate
as much corn, about a third as much meat meal tankage, and about two-thirds as much wheat middlings as where no buttermilk was given—evidently the buttermilk saved grain.

Note still further than on 100 pounds of gain, although it took a little over a ton of buttermilk or exactly 2,091 pounds, yet this 2,091 pounds saved considerable grain, or, to put it definitely and concretely, this little over a ton of buttermilk saved 294 pounds of corn, twenty-three pounds of meat meal tankage, seventeen pounds of wheat middlings and a quarter of a pound of salt. Putting it on a better basis, 100 pounds of buttermilk saved 14.09 pounds of corn, 1.17 pounds of meat meal tankage, .31 pound of wheat middlings and .01 pound of salt, a total of 16.07 pounds of grain replaced by 100 pounds of buttermilk.

Charging the corn at $60 a ton or $1.68 a bushel, tankage at $80, middlings at $50, and salt at $20 a ton this 100 pounds of buttermilk saved 40.19 cents' worth of feed or it was worth on the basis of values given practically 50 cents a hundred pounds, this on the basis of it being fed in very large quantities.

Bear in mind that the buttermilk also saved time. In reality each 100 pounds of buttermilk saved practically a day's feeding of the pig which meant that you saved a day's labor in the feeding of said pig every time you gave him a hundred pounds of buttermilk in this comparative experiment.

With brood sows this section found that buttermilk has a higher replacement value than with shoats. This is natural and to be expected. In one test we found that 100 pounds of buttermilk saved five pounds of hominy feed, which is practically the same as corn, plus nine pounds of tankage—a total of fourteen pounds of feed. Counting the hominy at $70 a ton and tankage at $80, the saving was 53½ cents, and what is more, the young pigs did better when buttermilk was added to the basal ration of hominy feed and tankage.

With fattening shoats, therefore, we note that in the instance of limited feeding a hundred pounds of buttermilk or skim milk is equal to twelve pounds of grain; when fed in large quantities, sixteen; whereas when fed to sows 100 pounds of similar buttermilk, fresh from the creamery, saved fourteen pounds of grain with suckling sows.

Buttermilk or skim milk, therefore, is valuable according to what it replaces, and in practice in the corn belt it replaces corn plus tankage or similar supplement. We must place its value, therefore, not on the price of hogs but on the price of the things that it takes the place of, in reality the feeds we would use if we did not have the milk by-product.

Most assuredly skim milk and buttermilk are especially valuable feeds when it comes to balancing our ordinary rations, and why should it not be so? Milk was produced for young animals, hence it comes to its own to its fullest extent when fed to suckling pigs, for instance, or to young weanling pigs that are just starting out in the race of life.

Potato Growers Gain by Grading

Improvement Made by the Middleman Brings to Him Big Profits That Should Go to the Producer.

IT SEEMS quite unnecessary to say that no machine has been made which will grade potatoes as to quality. The mechanical sizer simply sorts as to size, and the stock must be further graded by hand to eliminate potatoes affected by sunburn, dry rot, scab, frost, cuts or other defects. Investigations in nearly any wholesale market, of the manner in which potatoes are prepared for market by the shipper, will usually convince the most skeptical that there is great need of improvement. On every side may be seen quantities which must be sorted before they can be sold or which must be sold ungraded at reduced prices. Large and small, smooth and scabby, or otherwise defective potatoes, frequently are all shipped together.

The amount of money lost to growers, dealers and consumers each year through the shipment of ungraded or poorly graded potatoes cannot be estimated, but that it is very large and mostly unnecessary must be admitted. In many markets scores of men may be seen in cars sorting potatoes. Large quantities that are frosted, decayed, badly cut, bruised, diseased or otherwise defective are thrown away. Usually these are the grower's losses, and besides losing the invoice value of the defective stock culled out of these cars, he is also paying about twice as much for the labor as though he had graded the potatoes on the farm. The railroad receives the only full returns on such cars, for their charges are based on the quantity of potatoes hauled and not on the quality.

Quantities of cull potatoes sorted out of supplies sold to consumers may also be found in most retail stores that handle vegetables. Notwithstanding these losses by wholesalers and retailers, much undesirable stock is passed on to the housewife. This is a common complaint among consumers and they frequently ask why they do not receive better potatoes, stating that they do not buy and use as many potatoes as they would if good ones were always received.

It is found in all sections that the potatoes loaded into cars and shipped from the field at digging time, usually receive less care in sorting for size and grade than those shipped later in the season from warehouses or cellars. This is partly due to the rush to get the crop harvested and partly to carelessness. During some seasons hundreds of carloads are forwarded which, when loaded, are known to have been more or less frosted or frozen in the ground, or sometimes after digging or loading. When a grower or shipper knowingly loads such stock he invites disaster, rejections and losses. During the fall of 1915 hundreds of cars containing blighted, frost damaged or otherwise diseased and decaying potatoes, were shipped. A broker in one city in the Middle West stated that in the previous three weeks 150 cars of potatoes had been rejected on that market on account of poor condition. As this report concerned only one medium-sized market, for just three weeks, the total number rejected for this reason on all markets must have caused serious losses. These potatoes, no doubt, were shipped direct from the field.

Many of the cars of potatoes received on the markets, both bulk and sacked stock, contain only sufficient frosted or otherwise defective tubers to show a few "rots," but the sacks or potatoes near them become wet and it is then necessary to sort the entire car at heavy expense.

If all growers could have enough storage space so that their crop, when partly frosted or otherwise defective, could be held after digging until the damaged potatoes could all be detected and sorted out, instead of dumply cull stock is being moved, however, after digging, all concerned in marketing them would realize more money, as a rule. One dealer stated recently that in his opinion sentiment has as much to do with the potato market at times as have supply and demand. It is certain that when markets have been flooded for weeks with frosted stock which shows more or less decay, everyone concerned in the marketing of this crop becomes disgusted and the result is a "sick," "draggy" market on which every buyer expects to receive stock at a discount and waits until he does get it at a reduced price. Buyers are then afraid to pay the better price for good potatoes on account of the low price prevailing on "off" stock.

The larger part of the commercial potato crop is stored by growers or dealers and since this must be rehandled and most of it sorted to make certain no decayed stock is shipped, little extra effort would be necessary to grade the potatoes according to fixed standards. The results would more than justify the slight extra expense. The sorting table or "rack," as it is called, is used extensively in Maine and some other districts to sort and grade potatoes when they are shipped from storage. They are emptied on the high end of the rack and as sorted by hand run out at the lower, narrow end into barrels or bags.

Wholesale dealers claim that potatoes always should be bought from producers on their merits, but that at present in many places practically all grades are bought at the same price. This neither penalizes the careless grower nor rewards the progressive; on the contrary, it rewards slack methods and penalizes careful grading. Some dealers freely admit that in their opinion the dealers and all other buyers at points of production are largely responsible for present conditions because they have not given growers sufficient encouragement to grade carefully by always discriminating in price in favor of fancy stock. Competition in buying as well as in selling is very keen. Each buyer or dealer desires to do as large a volume of business as possible, and just as long as the potatoes he purchases can all be resold, everything offered him by growers will be bought almost regardless of grade. If one buyer at loading point refuses a load or a car on account of quality, usually there is another buyer ready to take it at the same price. Inspection by buyers at loading point is not as close and careful as it should be and too much is taken for granted. More care at this point would prevent many later rejections.

A large part of the grading and nearly all of the sizing in northern sections now is done by the local dealers or warehouse men and by the distributors' representatives at their warehouses or loading stations. Of course, the grower is relieved of this extra labor, but he must pay for the buyer's expense in accomplishing this work by taking a lower price for his product and sometimes losing the feeding value of the culls besides.

It should be remembered also that when growers leave the grading to the warehouse men they put themselves just that much farther away from direct dealing with the independent cash buyer or from direct sales to dealers in the cities. However, if the grower lacks the willingness to grade his potatoes effectively it is as well that the warehouse men or local dealer should do it.—[Bulletin.

THE STANDARD TRACTOR

It was several years before automobile manufacturers got away from single and two-cylinder motors. Power transmission too went through its changes. Many other features, thought good when the automobile was young, later gave way to standard construction.

Why not buy a tractor that will not have to go through these changes—the

TURNER Simplicity

—a tractor built on tried-and-proved principles, with all experimental and doubtful features left out.

The Turner Simplicity is the four-wheel, three-point suspension type. It's powered with a special Waukesha motor. Has Hyatt Roller Bearings. Standard construction throughout—the tractor of today and tomorrow. Burns kerosene and gasoline. Working parts are enclosed and run in oil. Easy to operate, turns short—in fact, it has every important feature a good tractor should have. An all around tractor for the farm.

The Care of Young Horses.

Practical Suggestions for Feeding and Management During Their Early Life.

COLTS can be housed satisfactorily either in the stable or in an open shed. The main requirements, says Farmers' Bulletin 803, recently issued by the Untied States Department of Agriculture, are that the quarters be dry, sanitary, and provide fairly warm protection from winds. Several foals may run together if the weaker ones are not driven away from their feed by the stronger. The quarters should be kept clean and well bedded and occasionally should be disinfected. Lice are to be suspected when the animals get to rubbing and lose patches of hair. Thorough washing with the proper solutions of coal-tar disinfectants will kill lice. It costs money to feed lice, consequently efforts should be made to keep them down. The foals should be out in the open every day that is not stormy; it is harmful, however, for them to remain out in a cold rain. The foal should be taught to lead and to stand tied during the first winter.

Feeds that will promote growth should be supplied. Good, clean clover hay is palatable and slightly laxative. Timothy hay commonly is fed. Well-cured alfalfa hay free from dust is one of the best roughages for growing, but because of its relatively high protein content it generally is economical to supplement it with other roughage such as timothy, mixed hay, or corn fodder. Besides lending variety to the ration such a method of feeding alfalfa would offset any likelihood of kidney or bowel irregularities. Sheaf oats can be used to advantage to supplement other roughage. The animals should not be allowed to gorge themselves on dry feed. They should be given only what they will clean up readily, but at the same time enough feed should be supplied. Oats, corn and peas, preferably fed ground, are suitable grains. Bran, oil meal or gluten feed will add protein and lend variety. Cottonseed meal should not be fed to foals. Appropriate grain rations for the first winter are: Two parts corn, five parts oats, three parts bran, and one part oil meal; or four parts oats, one part corn and one part bran.

Silage should not be fed to foals to any considerable extent. Sliced roots, such as carrots and sugar beets, are very palatable and have a cooling effect on the digestive system. The quantity of feed generally should be regulated by the appetite, although occasionally the appetite may be too ravenous to be a good indication. The general condition of the colt and the droppings should be observed daily. Usually not over one pound of grain per 100 pounds of live weight should be fed until the animal is two years old. A liberal supply of salt and good water and plenty of fresh air and exercise are essential for the proper development of young horses. Idleness succeeding exercise will cause constipation. It is often said that a horse is made during his first winter. Certainly this is a critical time in the animal's life, and at no other age will proper feed and attention do as much to make of him a good horse. It stunted during the first winter he never will gain proper size and shape.

Foals should be changed from dry feed to pasture gradually and should not be turned on pasture until the grass is old enough not to become washy. Grass is an indispensable factor in the economical and proper physiological development of young horses. Frequently in protected blue grass mountain valleys they thrive the year round on pasture alone. A visit to the foal pasture every few days may be the means of early discovering sickness or injury. The feet of the young animals should be noticed on such visits, and if the hoofs are too long or high on one side they should be trimmed properly. A failure to keep the feet level may result in cracked hoofs or crooked joints. Barbed wire should not be used for fencing the pasture; smooth woven wire is best. If a colt should be cut, disinfect the wound; and if it is a very large one, have it sewed up. The wound should be dusted frequently with boric acid or air-slaked lime until healed, and then greased with vaseline so the hair will grow properly. The animals should have plenty of fresh water and salt, and in hot weather they require shade.

During the second winter the feed and management should be nearly the same as for the first winter, except that the quantity of feed should be increased somewhat, the colt tied up in his stall, and handled frequently. Education by gentle and careful but firm handling at this age will save later much strenuous labor. In this connection Farmers' Bulletin 667, "Breaking and Training Colts," should be consulted.

Agriculture in Rural Schools.

How to Present the Work and Arrange Courses.—By E. L. Luther, Superintendent Wisconsin Farmers' Institutes.

IN ORDER properly to present the work which should be done in agriculture in the rural schools it is necessary to preface this article with a few statements which may not bear much relation to each other, but which do have considerable bearing on the subject in hand.

It is easy to map out courses according to the educational scheme which came down from the fathers. Map out the courses, set up the educational mill, grind out whatever drops into the mill; if the product gets anywhere, all well and good; if the product does not get anywhere, so much the worse for the product. But in the new scheme of education things must be different. A whole lot of factors and problems must be considered and the educational process made to get somewhere.

Before we take up the real problem, let us see what are some of the factors which should be considered in arriving at what the content of rural school instruction in agriculture should be.

1. The teachers are, for the most part, girls who will never be farmers. The pupils are not farmers, may never be farmers, and are anyway years removed from the time when they may be farmers.

2. Medieval traditions and sentiments concerning schools, implanted by a school system which has come down from medieval times, make it difficult for patrons and teachers to have school go on outside of the schoolhouse.

3. The school program is crowded now without adding to it in the way of anything else.

4. There is, as a rule, no school during the growing season.

5. Agriculture is not a "book" study.

With these few statements made, let us stop here to make a few statements of good pedagogy which should influence us all in the development of a modern education.

1. Instruction should be capable of application and use.

2. Instruction should come near to satisfying the needs of the time of life of those to whom the instruction is given.

3. Girls will seldom use systems of farming and systems of farming are far removed in time from the pupil age.

4. We should instruct the pupils as pupils, and not as we want them to be forty years from now.

5. The tasks should not be baby tasks, but the tasks may well be grown-ups' tasks which are within the accomplishment of pupils.

6. The tasks should also be vital and not fruitless.

7. Education should fit for living.

8. People live in communities and have problems which must be surmounted in order to survive.

9. The schools should help to solve the problems of the community and not be simply "cultural" affairs to fit for heaven.

10. This kind of pedagogy divorces "general" agriculture from the rural schools.

The rural course is cultural as now arranged. If agriculture is taught in the rural schools it would seem that at least this one subject might with propriety be presented with a view to its use in bread and butter getting rather than as to its "cultural" value. The speaker is of the opinion that much of what is ordinarily understood as "cultural" has little foundation in fact, but that what is often decried as utilitarian and bread-and-butter education would result in the highest culture were it rightly presented. This view is more or less substantiated by Dean Davenport, of the Illinois College of Agriculture, when he says, "It is a mistake to assume that all of the culture is in the dreamer's mind, or that it is unattainable by him who meets fairly the world's demands."

Agriculture in the rural schools should, therefore, consist in instructing well in a few concrete tasks which find real use and application in the industrial life of the neighborhood in which the rural school finds itself. By concrete tasks is meant things done with the hands. This kind of agricultural instruction is far different from word study from a text-book about general agriculture, the kind of agriculture (?) which we commonly find going on in rural schools when an effort is made to meet the statute requirement for instruction in this branch.

The demands of the neighborhood should in this one branch at least compel the rural school.

What then are some of the "concrete tasks" in which the pupils of the rural schools should be trained when the subject of agriculture is offered to meet the statute requirement? That will, of course, depend upon the industry or industries of the neighborhood in which the particular rural school finds itself. Assuming that the neighborhood is one in which dairying with potato growing is the farm system (and neighborhoods of this kind will predominate in which members of this association will instruct), the following "concrete tasks," with apparatus and reference are suggested:

1. The Babcock Test for Milk and Skim Milk—(a) A Babcock testing outfit. (b) Wisconsin Circular No. 27: "How to Use the Babcock Test."

2. Dairy Cow Milk Records—(a) Milk scales. (b) Record sheets: Ohio Dairy Separator Co., Minneapolis. (c) Wisconsin Circular No. 67: "Cow Testing Pays."

3. A Study of Corn—(a) Wisconsin Circular No. 58. "Selecting, Curing and Testing Seed Corn." (b) Wisconsin Circular No. 8: "Corn Judging." (c) U. S. Bulletin No. 229: "Production of Good Seed Corn." (d) U. S. Bulletin No. 537. "How to Grow an Acre of Corn." (e) U. S. Bulletin No. 617: "School Lessons on Corn." (f) U. S. Bulletin No. 739: "Cutworms in Corn." (g) Collect, name and judge main kinds of corn grown in district.

4. A Study of Potatoes—(a) Wisconsin Bulletin No. 280: "Potato Growing in Wisconsin." (b) Wisconsin Circular No. 52: "Control of Potato Diseases." (c) Wisconsin Circular No. 83: "Fighting the 'Potato Bug.'" (d) Collect main varieties of potatoes for Wisconsin: Rural New Yorker, Green Mountain, Burbank, Triumph, Irish Cobbler, Early Ohio and Early Rose.

5. A Study of Farm Commercial Seeds—(a) Collect, bottle and name seeds of wheat, oats, rye, barley and buckwheat. (b) Collect, bottle and name seeds of red clover, alfalfa, alsike and timothy. (c) Collect and mount sample plants of each of the above. (d) Test samples of above seeds for purity (magnifying glass). (e) Test samples of above seeds for germination (tins and blotters). (f) Wisconsin Circular No. 57. "Fight Grain Smuts and Blights." (g) Wisconsin [illegible] 85 "Stack First—Then Tresh." (h) U. S. Bulletin No. 428: "Testing Farm Seeds in the Home and in the Rural Schools." (i) U. S. Bulletin No. 455: "Red Clover." (j) U. S. Bulletin No. 507: "Smuts of Wheat, Oats, Barley, Corn."

6. A Study of Common Weeds of Field and Garden—(a) Collect, bottle and name seeds of twenty common weeds. (b) Collect, mount and name plants of same seeds. (c) Wisconsin Circular No. 48: "How to Rid Our Farms of Weeds." (d) Wisconsin Weed Samples No. 1. (e) U. S. Bulletin No. 660: "Weeds; How to Control Them."

7. A Study of Dairy Cow Rations—(a) Collect, bottle and name wheat bran, oil meal, cottonseed meal, ground corn, middlings, ground oats. (b) U. S. Bulletin No. 743: "The Feeding of Dairy Cows." (c) U. S. Bulletin No. 777: "The Feeding of Dairy Calves."

8. A Study of Milk—(a) Secure sediment tests from creameries and cheese factories. (b) Make sediment tests (funnel and absorbent cotton). (c) U. S. Bulletin No. 363: "Use of Milk as Food." (d) U. S. Bulletin No. 413: "Care of Milk and its Use in the Home." (e) U. S. Bulletin No. 490. "Bacteria in Milk." (f) U. S. Bulletin No. 602: "Clean Milk: Production and Handling."

A careful inspection of this list of subjects will show that they are all

1. Common, easy and doable in rural schools.

2. As a rule, unused on farms.

3. Can be done in schoolrooms. Do not require field trips.

4. Are men's tasks doable by school children.

5. Of highest economic importance.

6. Of such character that if they were done on all farms by the owners thereof agriculture in Wisconsin would assume a much more profitable character.

The rural school program is now too crowded with subjects to admit of too comprehensive agriculture. It will be noticed that each one of the above tasks is complete in itself. Any one or all may be done in a school year. They easily loan themselves to accomplishment after regular lessons have been prepared. The ordinary teacher drilled in them can easily show pupils how to do them at intermission times and odd moments. The last hour each Friday devoted to them will accomplish considerable. Simple home projects may be arranged easily. Whereas lessons from a text consume regular periods for study and recitation.

It is incumbent upon the rural school to instruct its pupils in these things not as "cultural" subjects, but to fit them to become more economic than their parents. However, teachers will be surprised to find that pupils who are nourished upon these things will show greater culture than will pupils whose subjects have fitted them to do nothing.

Real instruction in these things and not book and word study of general agriculture is the neighborhood's demand upon the rural school. The demands of the rural school should in turn compel the normal teachers' [illegible] school. Those preparing to grind upon mere book learning [illegible] repeat. The demands of the neighborhood should compel the rural school. The demands of the rural school should compel the normal teachers' training school. The course in the training school should be a preparation for the school below rather than for the school above it. Upon the training which teachers receive depends the character of the instruction which will be given in the school taught. This is a great responsibility upon the normal teachers' training schools.

The expense of materials needed for agricultural work in rural schools is approximately as follows:

Babcock tester from.....	$5.00 to	$15.00
Milk scales	3.00	3.00
Small bottles	2.00	2.00
Small pie tins	1.00	1.00
Magnifying glass or glasses	.50	2.00
Funnel and absorbent cotton	.25	.50
Postage for bulletins and milk record sheets.....	.50	1.00
Cabinet to store apparatus in	5.00	5.00
Total	$17.25	$29.50

The apparatus being so simple and inexpensive, easily within the buying power of any district or basket social, and the real work to be accomplished so within the ability of any ordinary teacher even without special training, may we not expect to see at least these few things which would prove of such benefit to our farming communities become every-day practices in our common schools?

Where Teachers and Scholars Have a Real Chance.

A modern practically fire-proof schoolhouse erected at [illegible] $5,000 with well-lighted and well-ventilated assembly roo[illegible] a hot-air furnace and supplied with modern sanitary facilit[illegible] ing has small rooms for domestic science or manual train[illegible] is not a consolidated school, but used by one district a[illegible] teacher.

A Schoolhouse Which Should be Torn Down.

There are still many districts in Wisconsin where the one-room, old-type, unsanitary, poorly-ventilated, poorly-heated, schoolhouse is in use. But school buildings of this type are disappearing rapidly and especially in the sections of the state which are opening up new territory, modern, sanitary schoolhouses of a splendid type are being erected.

Five cows in the University of Missouri College of Agriculture dairy herd have made records of more than 20,000 pounds of milk in a year. Three of these cows are in the herd at present. Fifteen cows have made records of more than 700 pounds of butter in a year. Five of these are in the herd at present. Three cows in the present herd have records of more than 750 pounds of butter in this time.

Silage might be called winter pasture."

In and Around Wisconsin

A good deal has been said of late relative to the coal situation, but there are many communities in Wisconsin where it is unnecessary to worry about coal for fuel. Wood for fuel still exists in abundance in many parts of Wisconsin and this is the winter to take advantage of local conditions.

Someone has figured out that if all the 1,800,000 dairy cows in Wisconsin would do as well as eighty-three cows in cow-testing associations have done the past year, the production of butter alone in the state would run over $400,000,000. This would be an increase of nearly $300,000,000 more than we now have.

Recent reports reaching the United States from French sources indicate that the shortage of cattle in Germany is not so apparent as in France and Belgium. It is claimed that the Germans have seized about 2,700,000 of France and Belgium cattle and one authority believes that Germany has been able to maintain practically all her original share of cattle.

Wisconsin, Ohio, Michigan and Minnesota are four states which have more than twice as big a potato crop this year as in 1916. Iowa showed a gain of 117 per cent, which is the highest increase of any state in the Union. The country as a whole increased the potato yield 54.04 per cent over 1916 and set a high-water mark for potato production with 439,686,000 bushels. The yield in New York is 38,000,000 bushels and slightly in excess of that in Wisconsin.

About thirty farmers of southern St. Croix county recently held a conference at Baldwin to effect plans for putting in hemp next year. Thomas M. Olson, St. Croix county representative, was chairman of the meeting which was addressed by A. H. Wright, of the field crops department, college of agriculture. There were about twenty-five acres of hemp grown in the vicinity of Baldwin last season. One advantage of hemp is that it will aid greatly in choking out quack grass.

B. D. Leith, of the Wisconsin Experiment Station, advises top dressing of wheat to save the Wisconsin crop from winterkilling and he says there are two ways of top dressing—with manure and with straw. The advantage of the first method is that it serves as a protection and also adds to the fertility of the soil. However, the use of manure is more difficult because of climatic conditions in the state. According to Mr. Leith, it must be done with the spreader and the manure must be beaten fine. It must not be spread out in chunks. The manure spreader is best used when the ground is frozen and sometimes this is too late. Unless top dressing with manure can be done at once, it is better and safer to plow under manure. Top dressing with straw is an easy method and there is no danger of smothering the plant. A straw spreader has been invented, consisting of an attachment back of the hayrack and this is being tried at the experiment station farm under the direction of F. M. White. The advantages of top dressing wheat are that the ground is uniformly protected. Fertility is added in the form of a mulch around the young plant and the dressing conserves the moisture so that drying of the soil in the spring is prevented.

Our neighbors in Canada are taking advantage of the shortage of live stock throughout the world. The live stock figures for 1917 in Canada show an increase over 1916 ranging from 4 per cent on hogs to 47 per cent increase for horses. Milk cows increased about 13 per cent; sheep, 17 per cent, and cattle, other than milk cows, 27 per cent. However, the number of head of live stock in Canada is relatively small, especially as compared with the United States. The whole of Canada has about the same number of milk cows that there are in Wisconsin—perhaps a little less.

More than 100 Wisconsin high schools having agricultural subjects in their regular high school courses will enter live stock judging teams in local contests which will be held at twenty-seven different points in the state during the next two months. These contests are in preparation for the third annual junior live stock judging round-up to be held in Madison, February 8th and 9th. The districts have been assigned to committees with these district leaders supervising the preliminary contests: Bayfield, John Light; St. Croix Falls, W. C. Hansen; Roberts, J. M. Hammer; Grand Rapids, W. W. Clark; Cumberland, R. W. Lightfoot; Mondovi, M. L. Geraldson; Wausau, A. G. Burd; Chippewa Falls, W. Christensen; Green Bay, R. H. Camerson; Shawano, W. Dunwiddie; Green Lake, E. H. Manning; Ripon, L. B. Cummings; Waldo, E. S. Brick; Onalaska, T. H. Campion; Blue River, A. J. Opstedal; Viroqua, Irving T. Dean; Mazomanie, M. R. Goddell; Cambria, E. M. Cox; Mt. Hope, P. F. Graf; Livingston, C. R. Wiseman; Blanchardville, W. S. Jacks; Marshall, Ea[illegible] J. Cooper; Milton Junction, M. J. Sahagen; Stoughton, W. O. Boardman; Pewaukee, A. G. Oosterhuis; Rochesterm, E. A. Polley, and Janesville, A. B. West.

Farmers' Co-operative Creamery, Hillsboro, Wis.

This creamery made over 800,000 pounds of butter in 1916 and 1917. This year on the same property a cheese factory 36x56 has been erected, of the same concrete construction with pebble dash effect. The cheese factory will be occupied in the spring. The creamery paid 45 cents for butter fat in September and the cheese department paid 62½ cents and an overrun to be divided at the end of the year.

These Are the Girls Who Fed and Fitted Baby Beeves for the Recent Madison Show.

Ditch Yourself Rich

All over the country—in every county and town, almost on every farm—there is wet, soggy land that needs underdrainage to be at all profitable.

Owners are ready and waiting to have this ditching done by Buckeye Traction Ditchers and will pay *good prices* for contract work.

Why not take this up? You can make it a between-times job or a year round business. Either way it will pay you big. Some ditcher men clear $10 a day *and up,* depending of course on circumstances; but anyway you look at it, the business is a gold mine.

Buckeye Ditchers cut through frost and hardpan. Apron wheels give support on swampy land.

Here is a letter from Mr. H. W. Sherrard, of Twelve Mile, Ind., who cleared $97.96 a day. Sounds good, doesn't it?

"With my No. 1 14½-inch-cut machine my helper and I put in 157 rods of tile in one day, of which 112 rods were for 12-inch tile averaging 48 inches in depth, bringing me 72 cents per rod, and 42 rods of 6-inch tile averaging 38½ inches in depth, bringing 38½ cents per rod—making a total of $97.96 in a single day. I challenge anyone to beat it with a No. 1 machine."

The Buckeye is a *complete* machine. Cuts 100 rods of perfect trench true to grade and ready for the tile every full day. Gasoline or kerosene power, easily managed by one man and not at all liable to breakage.

Our Service Department will coach you about details and help you to get started. Write for "Dollars In Ditches"—a book of facts; mighty interesting reading if *you're* interested.

The Buckeye Traction Ditcher Co., 1721 Crystal Ave. Findlay, Ohio

"A Perfect Trench at One Cut"

BUCKEYE Traction Ditcher

HAEGER Drain Tile Lasts Forever

Half the cost of draining land is labor cost. Why add to this by using inferior tile which breaks, clogging the drain and necessitating repairs? HAEGER Drain Tile is strong, straight and well-burned. No crumbling in the ground and little breakage in handling. Once laid the drain gives good service for a lifetime. Drain your swamp land—raise big crops next year—take advantage of high prices.

FREE BOOK—"FARM LAND DRAINAGE"—sent on request. Buy either direct or through your dealer. Look for the "DIAMOND H" mark.

HAEGER BRICK & TILE CO. 1 State Bank Building DUNDEE, ILLINOIS

FARM LAND DRAINAGE

DRAIN TILE

POOR light in the home is often the cause of nervous disorders resulting from eyestrain. Those who read, work or study at night need good light. American Portable lamps give 400 candle power light for less than ½ cent per hour. Ornamental and handy. Safe as daylight. No smoke, smell or dirt. No wicks to trim, no chimneys to wash. Low in price. Ask dealer or write for circular.

American Gas Machine Company
745 Clark St. ALBERT LEA, MINN.

Ford Radiator Cover $1.35

Fits like a glove — smooth and sightly. Made of special heavy warm felting, covered with rich black leatherette. Postpaid $1.35. Hood cover, postpaid $1.90. Tell model and year of Ford. Satisfaction or money back. Write for Book of 739 Ford Bargains, Everything for Fords.

FARM MECHANICS

Questions and Answers.

Tractor Attachment for Velie.

I have a Velie car, 1913 model. I would like to know of the different companies that make tractor attachments for this car.

Answer.—We do not know of any company making tractor attachments for Velie cars.

Motor Lacks Power.

I have a two-cylinder Model F Buick. It misses. It pulls well when tried with a screw driver; but when running on low, it pulls by jerks and it has no power on high. It has a Schebler carburetor and an Atwater-Kent unisparker.

Answer.—Your car probably needs a general overhauling. The transmission bands should be relined. You probably also need a new set of piston rings. While you have the pistons out examine the cylinders for scored places. Your spark gaps at the spark plug points may be too wide or too narrow. The gap should be the width of a smooth dime.

Primer and Water Cooler.

On the enclosed sheet is a primer that has a priming tank on the dash. Would there be danger of fire? Do you think this primer is better than priming cups? Will the multiblade fan like enclosed cut keep a Ford motor from overheating? What is your opinion of the water circulator shown on the enclosed cut?

Answer.—The primer shown should be superior to priming cups, and there would be but little danger from fire; in fact, not as much danger as there would be while priming an engine through priming cups. Either the multiblade fan or the water circulator should aid in preventing your motor from overheating.

Density Varies Between Cells.

We have a Willard storage battery that has been in use eighteen months. This is a three-cell six-volt battery. In the cell at the positive end, the density of the electrolyte is 1,250. At the other end, the density is 1,150, while at the middle cell it is 1,200. What is the cause of this and the remedy?

Answer.—The difference is probably due to local action within the battery, or it might be caused by more evaporation from one cell than from the others. You should give your battery a fair overcharge and if this does not equalize the gravity of all the cells, add enough acid to the weak cells to bring them to the strength of the strongest one, which is none to high if the figures given above are for a fully charged battery.

Adjusting Marvel Carburetor.

I would like to know the rules for adjusting a Marvel carburetor, used on a twenty-five horse-power 1914 model Buick. I would also like to know whether the camshaft bearings of a 1914 Ford car are simply wedged into place or are they fastened with a screw or key?

Answer.—The two front camshaft bearings are held in place by set screws through the side of the crankcase. The rear bearing is a press fit in the case, no screw being used.

The T head bolt at the bottom of a Marvel carburetor is the gasoline adjustment. The angular screw on top of the float chamber is the air adjustment. The following method of adjusting this carburetor is taken from the "Horseless Age:"

The adjustment is effected by first closing the gasoline needle valve, then opening by turning three-fourths to one turn to the left, the packing being tight enough to hold the needle valve firmly in place. The air adjusting screw should be so adjusted that the end of the screw is about even with the end of the ratchet set spring. The starting choker should be arranged to close the valve completely, in order to enable the engine to draw off gas easily for starting. After the engine has started, close the gasoline needle valve a very little at a time until the engine runs smoothly. To get proper adjustment of the air valve, turn it to the left so that it backs out and releases the air spring until the engine begins to slow down. Then retighten by turning to the right for about one-eighth of a turn at a time until the engine runs smoothly. Advance the spark about two-thirds of its travel, open the throttle quickly and the engine should speed up.

Burning Kerosene in a Ford Car.

I am thinking of attaching a kerosene burner to my Ford car, and I wish to know what you think of it. Is the trouble from carbon too great to make the use of kerosene economical? Would the dissolving of moth balls in the kerosene make it more explosive? I would be pleased to hear of anything that will give me more knowledge on the using of kerosene in the Ford engine.

Answer.—There are several outfits on the market that are said to burn kerosene successfully in the Ford engine, though none of these has come directly under our observation. It is generally admitted that heat is necessary for carbureting kerosene, and, therefore, gasoline is used for starting. As soon as the engine becomes hot, the kerosene is turned on and the gasoline shut off. The kerosene is heated either by passing it through the cooling water or through a chamber around which the exhaust passes; or the exhaust is made to heat the mixture just before it passes into the cylinder. The kerosene should be heated to not less than 170 degrees, but it should not be heated hot enough to char it. If heated too hot, a coating of carbon gradually stops the fuel line.

One company avoids carbon trouble by using a special cylinder head that is so constructed as to reduce the compression of the engine. Other devices depend upon adding a small amount of water vapor to the mixture. This is an old method of preventing carbon trouble in kerosene motors. Moth balls dissolved in the fuel are said to make the mixture more explosive.

Car Does Not Run Well.

We have a four-cylinder Model 1910 Reo car; equipped with Splitdorf low-tension magneto with transformer coil. It has a Stromberg carburetor. We have changed the magneto lately and overhauled it. The car will not start by cranking, but by pulling it a short distance with another car it will start, but it has very little power. Where is the trouble?

Answer.—Any car will run if the mixture is correct, the compression good, the spark good and the motor properly timed. If the compression is not good, regrind the valves or fit the piston with new rings if necessary. It may be necessary to regrind the cylinders if they are badly scored. Good compression is necessary for power. This rule should always be remembered. The spark may be easily tested by taking out the spark plugs and laying them on the top of the cylinders with the wires connected to them, the terminal end of the plug not touching the cylinder. Turn the motor over rapidly by hand and the spark should appear at each of the spark gaps in the proper firing order. If it does not trace the trouble back to its source, which may be a cracked porcelain, a dirty porcelain, a broken wire, a poor connection, worn contact points or a faulty condenser. As for timing the motor, the exhaust should close and the intake open soon after the piston reaches the top dead center, and the spark should occur near dead center just one revolution later. Regard only one cylinder when timing, as if one is right the others should be. The mixture depends upon the carburetor adjustment, which can best be made while the car is running on the road, one man on the running board making the adjustments while another drives the car. See the instructions above for adjusting carburetors. Air leaks around the intake valve stems or at the intake connections often interfere with the mixture and cause the car to run badly, and this may be your trouble.

Trouble With Motorcycle.

I have a 1913 Indian twin-cylinder motorcycle that has been giving me considerable trouble lately. It works fine on the stand, but when on the road it will run about ten yards and then dies down. Sometimes it takes a spell and works fine. I have bought a new Model H Schebler carburetor made especially for this machine. I received no instructions for adjusting the carburetor, and I think the adjustment may be the cause of the trouble. What do you think is wrong with the machine to make it act as it does?

Answer.—First, see that all your electrical connections are tight. A loose connection might cause your trouble. Dirt or water in your fuel might also cause it. A little lint under the float valve or a sticky float valve might be responsible. Be sure that the fuel line is open.

Your carburetor may not be properly adjusted even though the motor runs well on the stand. A further adjustment on the road may be necessary. Include some hills in the road test, as a good mixture on the level will not always work well on hills. If the motor does not run well, vary the gasoline supply by turning the knurled nut or knob of the needle valve without stopping the machine and note the tone of the exhaust. There is a fine, snappy ring to the exhaust of a perfect mixture. With a dull tone and sluggish running, first reduce and then increase the gasoline supply, and note the effect while running on the level. If the motor heats on level ground and overheats on the hills the mixture is too rich. If the running is weak and not accompanied by heating, give more gasoline, as the mixture is too weak. The response of a motor to the spark advance is a good test; if much advance is needed to produce a good acceleration, the mixture is too lean. An immediate response to a change in the spark position is an indication of a correct mixture. A maximum advance is not needed except at highest speed. Continue the road trial until the carburetor works well at both low and high speeds, the high speed adjustment being made large by adjusting the tension on the air valve spring and the low speed adjustment by varying the needle valve. The color of the exhaust flame for a perfect mixture is a dark blue. A yellow tint indicates too lean a mixture, while a red tint shows too rich a mixture. A black smoke

The Farmer's Concrete Mixer
SHELDON Batch Mixer Price $11.50 Up

The Sheldon was designed especially for the farm. Highly praised by users. Farmers everywhere call it the ideal mixer. Used today all over the United States. A big success. Small enough to be easily moved—big enough to keep 6 men busy. Low in price. Build your own silo, tanks, troughs, floors, foundations, buildings, etc., out of concrete with a Sheldon Batch Mixer.

Read What These Sheldon Owners Say

I and my hired man laid a feeding floor for my hogs, 24x24, in one day; also put floor in my cow barn. My neighbor liked it so well I am not able to keep it at home—ANDREW CHRISTENSEN, Hancock, Minn., Rt. 1.

We have used the mixer during past year for putting in cement foundations for a complete set of farm buildings, including silo, and like it very much—DANA WEIGHT, Jamestown, N. D.

Last year I bought a cement mixer from you with which I am well satisfied. It did not take long for it to pay for itself and I surely can recommend it to anyone needing a *big mixer at a small price*—WM. PARKS, Martinton, Ill.

I am more than busy with my Sheldon Concrete Mixer. Have more work than I can do. *I get $10 a day when I work out*—JESSE L. WITTER, Wellsville, N. Y.

The machine works fine. Have already *got the job* of mixing concrete for the bridges in this township—JOHN ROSE Spartansburg, Pennsylvania.

Last spring we purchased of you a set of castings to make a concrete mixer. It was constructed per the plans furnished and it *surely worked great*—D. M. BRUBAKER, Freeport, Ill.

FREE PLANS

Make your own concrete mixer. You can do it at a cost so low you can not afford to mix concrete by the shovel method. Along with our iron parts we send Free Plans and permit for making your own machine. A good way to get a practical mixer at a small expense. Or, we will sell you the complete machine, ready built.

Make Big Money at Concreting

If you buy a Sheldon Mixer for your own use, you can make many times its cost in a season by renting it to your neighbors. Or, if you want to go out with the mixer on contracts, you can easily earn $3 to $20 a day. Our customers are doing it right now. The jobs go to the man with a Sheldon Mixer every time.

Write For Our New FREE Catalog

Shows our full line of mixers which are sold direct to you on strong guarantee. *Thirty days trial* privilege. No other like it. Patented. Two styles, hand and power. Mixes 2 1-2 cubic feet a minute. One man can operate it, but it will keep 2, 3, 4, 5 or 6 men busy. Continuous chain drive. Tilting dump. Easily and quickly moved. All parts guaranteed. Does work equal to $400 mixers. Be sure to get the catalog. Write today.

My New Special Offer

I want to tell you about my co-operative plan by which you can get my time-tried, thoroughly proven Sheldon Batch Concrete Mixer at little or no cost to you. I want ten men in every county to accept my special co-operative offer right now. Are you going to be one of the ten? Write and say: "Send me special offer."

The Sheldon will pay for itself on first small job. Takes the backache out of concrete. Makes possible those many small improvements that add so much to the value of your land.

from the exhaust shows too rich a mixture, while popping back in the carburetor is caused by too lean a mixture. A white smoke from the exhaust indicates too much oil.

Electric Lights on Auto.

Will you kindly answer this question for me: Can I make my lights on my car from a dynamo, and how?

Answer.—You can. You will need a six-volt sixty ampere hour storage battery, an automatic cut-out, a charging dynamo of eight or ten volts and eight amperes capacity; also the switch and necessary wiring. Your dealer in auto supplies should be able to furnish you with all this material.

The greatest problem will be mounting the dynamo. One method is shown

in the figure. Nearly all motors have a fan drive pulley held on its shaft by means of a nut. This nut may be removed and an extension shaft made to screw on in place of the nut. On this extension shaft, a pulley may be mounted to run the generator by a belt.

In the figure, one terminal of the generator is grounded, only one wire leading from it. All wires are shown in heavy solid or dotted lines, the dotted lines indicating that the wire is inside the channel iron of the frame. The wire from the generator, D, runs to the cut-out, C. From cut-out, C, a wire runs to the battery, B. Soldered to this wire is a wire leading to the switch, S, on the dash. From the switch a wire branches off to each of the lamps. One terminal of each lamp and one terminal of the battery are grounded at GGGG. These ground connections must make good metallic contact with the frame. HH are the head lights, T is the tail light. Use six-volt lights in all lamps, the tail light being two candle power and the head lights eight to twelve candle power.

Maximum Carloading Urged.

Real Economy in Hauling Heavy Loads.

American railroads are now moving more traffic than was possible under the old system of operation. Yet the traffic offering is still beyond the reasonable capacity of the railroads.

This situation presents the problem of further increasing carrying capacity in the shortest possible time to meet military needs and for distributing necessities among our people. New railway equipment can be added but slowly; factories are working night and day on government war needs. Shortage of labor is a factor in holding back other improvements. A means immediately available for increasing car efficiency is heavier loading and prompt loading and unloading. This situation was pointed out soon after the entrance of the United States into the war and many shippers and receivers responded in an effective manner, but the response was not as general as desired.

Railroads claim that while they have built cars of greater capacity, larger locomotives, and have provided heavier rails, there has been less progress in scientific car loading than in any other field of railroad operation.

The advantage of maximum loading to the public is apparent. For example: Richard Roe and John Doe, living at Urbana, Illinois, order farm supplies from Chicago. Each order amounts to 30,000 pounds and they are placed separately at slightly different times. Two 36-foot box cars, each weighing 40,000 pounds with a carrying capacity of 80,000 pounds, loaded at a minimum of 30,000 pounds, ae required to carry these supplies from Chicago to their destination. The gross weight of the two cars and contents is 140,000 pounds and the freight charges $45.00 per car.

Should Richard Roe and oJhn Doe order their farm supplies together, the entire shipment could be placed in one 36-foot car. The gross weight of the car and contents would b but 100,000 pounds and the total freight charges, $90.00. This would save the haul of 40,000 pounds dead weight and one boxcar. Thus one car would be added to the railroa equipment without expense; one car space would be saved on each loading track, yard track, passing track, unloading track and in the train, and the cost of one car saved in the railroad's capital stock investment. In addition to this, the efficiency of the locomotive in handling the commodity would be increased.

Were it not for the campaign by the railroads for heavier loading and the response from some shippers it would have been impossible, particularly in the East, to move traffic last season. Different classes of shippers have met with the Food Administration, set aside selfish interests, considered a situation, dealt with it as a whole and by coöperation have accomplished things which, under different conditions, would have been almost impossible.

Farmers can assist materially in the present emergency by clubbing together, when ordering farm supplies direct from manufacturer. Prompt loading and unloading of shipments is also important. These matters are of vital concern and everyone is asked to lend his hearty coöperation for the common good.

Why More Sheep.

To the Editor:—The call for more sheep goes up from all parts of the country. Not always is it evident just why this appeal should be heeded by the general farmers of this country. As it appears to me, here are some of the reasons that may be given why our farmers might well increase their flocks.

The first thing the practical farmer wants to know about any proposition is, "Will it pay?" On this score there can be no doubt about it. There is money in wool, money in growing lambs for the market and money in selling grown-up sheep for meat. This is not a bare statement. Facts and figures prove it to be true.

The cost for hired help is less for sheep than for almost any farm animal we have. It is true that for a time in the spring of the year when the lambs are coming the farmer must provide care and shelter for his flock. Not to do this will invite loss of lambs and greatly cripple the work of the year. At other seasons, sheep will quite take care of themselves. Give them a good pasture, a never-failing supply of water and a bit of salt now and then and they are all right.

A sheep will enrich a farm greatly by the droppings it leaves wherever it goes. The manure from sheep is very rich.

If we have pastures that are rather weedy, sheep will clear them up as well as any farm animal I know of. I have seen them take a field where the goldenrod was higher than their backs and thick as could be everywhere and clean it up in a short time. Brush of all kinds can be taken care of in the same way. The world needs more wool and mutton. Much is said about the patriotic duty of growing wheat, corn and other farm stuffs. To my mind, the same thing applies to the keeping of sheep. If there were no other reason why every farmer whose land is adapted to this business should invest in at least a few sheep, seems to me this is sufficient. The need of the world is great.

Sheep keeping is a branch of farming that most men enjoy. Few men but like to see sheep about them. There is in most men a natural shepherd instinct. No others should undertake to keep sheep. If one is not attracted by the presence and care of sheep, but greatly prefers to do some other kind of farming, he should by all means leave the sheep-keeping industry to somebody else, for he will not be very apt to succeed. To do anything out of a sense of duty, and for that reason alone, is to almost warrant the prediction of failure.

Then, finally, more sheep are needed to supply the leather demands of our own and neighboring nations. Leathers of all sorts are short. In some countries people are going barefoot today. Hides are scarce and high in price. It is worth while for all American farmers to do what they can to meet this universal want. E. L.

Champion "Minute" Spark Plug Cleaner

Clean Plugs
—and Hands Clean

WITHOUT taking the plug apart, in a fraction of the time it used to take to *half*-clean your spark plugs, you can now get them *really* clean without even soiling your hands.

Just half fill the tube of the cleaner with gasoline, screw the plug in the socket at the top and give it a vigorous shaking.

The gasoline softens the carbon and the little flying needles pick it off in small particles and leave the plug cleaner than you could get it in the old laborious way.

Champion Minute Spark Plug Cleaners cost only 75 cents, come in a neat wooden box that will pack neatly in your tool case and are sold by supply dealers and garage men everywhere. Get yours today.

Polk County Butter and Cheese Association.

To the Editor:—It might be said that the Polk county butter and cheese makers, through their association, have accomplished a great deal of good during the eight years that they have been organized.

They meet once or twice a year for a discussion of various topics of interest to the men who make the butter and the cheese of the county. At the meeting held October 18th an extra effort was made to get the producers to attend. One of the speakers was requested to present their phase of the work and at future meetings the milk and cream producers will be invited to attend.

These local, or county meetings, are the means of getting the boys together for a friendly discussion of the problems in which they are interested. It also creates an interest in good butter and good cheese.

The men come to these meetings with a jar of butter or box of cheese under their arms and each has the opportunity of seeing the judges do the work. These men may be counted on for an exhibit at the state or national convention and the state fair as well. One out of every nine tubs entered at the Wisconsin State Fair in September came from Polk county, with nearly the same ratio for the Wisconsin exhibit at the recent Milwaukee national.

That the boys make good butter all the time is shown by the scores placed upon the butter from this county at four contests held during September and October. (See table.)

SCORES RECEIVED BY POLK COUNTY MEN.

Name	N. W. State Fair Chippewa Falls	Wisconsin State Fair	Mil. Nat. Conv.	Polk county
P. Kristensen, Cushing	95.25	94.66	94.50	94.50
B. Luidvig, Milltown	74.75	95.33	95.50	94.50
Albert Erickson, Amery, R. 4	94.37	95.33	94.33	95.00
C. Back, Luck	93.25	95.83	94.50	96.00
R. Butler, Amery	93.25	95.00	94.33	....
J. Vigen, Frederic	92.50	92.16	92.50	....
Elmer Erickson, R. 2, Luck	....	....	93.00	94.75
H. D. Harrison, Clear Lake	....	95.50	93.50	....
J. E. Mattson, St. Croix Falls	....	95.00	96.00	94.75
George Nelson, Atlas	....	95.33	....	94.50
Emil Holverson, Nye	....	92.50	....	....
L. Butler, Lewis	....	....	....	93.25
Average	93.89	94.66	94.24	94.63

A close study of these scores reveals the fact that the men consistently make good butter and the different judges were in tune. Not the same man came out on top each time. This is not to be expected when there are several high-scoring tubs entered. It is doubtful if another county in the state can show an equal record for total entries, number of scorings and an average score of 94.40 for thirty-three tubs.

It cannot be said that the good butter of Polk county is the result of any one line of activity, but a combination of several. Coöperation has done its share, not only because a large percentage of the factories are being operated on a coöperative basis, but also because of the coöperation existing between the buttermakers. A large number of the milk and cream producers are interested in the production of good raw material. This may be due to the demand made by the management of the various factories for good butter and standing by the makers in their efforts along these lines.

The county has a number of well-equipped factories, some of which may be classed among the best in the state.

Climatic conditions also favor the production of good milk and cream and the dairymen are beginning to realize that the best is none too good. The future will see better cows, well-equipped barns and a large number of the cow owners familiar with feed values; now the cows may be fed to secure greatest returns.

It is to be regretted that there are a few dairymen in the county who are not interested in the future welfare of the community in which they live. They do not patronize the local creamery and they are not inclined to take kindly to instruction pertaining to the production of clean, well-flavored milk and cream.

May the work of the Polk county association continue and the indifferent dairymen be reached.

Polk Co., Wis. Albert Erickson.

The Calf on the Way Up.

To the Editor:—Just now on our own farm we have some of the likeliest looking heifers coming on that we ever owned. One of them will soon begin to give milk and the rest will be along in a few weeks. These heifers are of the same breed we have had a good many years and from the same cows practically as in former years, but I am sure we never had finer stock than these are.

One reason why these heifers have made such growth is that it so happened that when they were young calves we could give them warm milk right from the separator. On account of the tie-up in the milk business the creamery at the village a couple of miles away did not do business, leaving it for the farmers to do as they could with their milk. We got a separator and made our own butter. That left us with the skim milk, and we gave it to the calves and the pigs, and some to the hens. Never did we get better return from skim milk than we did that year.

This proves to me the value of a good start. This year we have not been making butter, so we have not had the sweet skim milk and our calves show the difference, although we have done our best by the use of stock foods and other means to make up for the loss of this finest of calf foods.

Where one has not the milk it is harder work to start the calf well, but that it can be done I am sure. A few days ago I saw a calf that has not had any milk, but has been fed some grain, plenty of hay and what water it would drink, together with freedom from the pest of flies. This calf was born in the spring of 1917, but I have seen many calves nearly a year old that were not a bit larger. I ought to say, also, that this calf never has known what unkindness was, and this I know has had a good effect upon its growth.

On the way up the calf that gets acquainted with the feel of a brush and comb has a marked advantage over one that is left with rough hair and dirty skin. The condition of the hide has much to do with the health and so with the thriftiness of the calf. If the pores of the skin get stopped up, so that the calf cannot breathe through them, it will take more food to keep the animal growing. For this reason, grooming is worth money. It takes but a few minutes every day to go over the calf with comb and brush carefully, and, saying nothing about looks, we will surely find that the calf will grow faster.

The worth of good water and plenty of it daily is another good thing for the calf, no matter what else it may be getting in the way of feed or drink. There is something about water that neither milk nor stock food contains, something the calf needs, as well as all other living creatures. This ought to be fresh and given in a trough or bucket that is perfectly clean, for we must not forget that from unclean vessels come the germs which, taken into the body of the calf, are pretty sure to convey disease.

Then, too, the hay fed ought to be good hay, free from dust or any weeds that would injure the calf. It is a good plan to tuck away in some corner of the barn a little hay to be fed exclusively to the calves. Subscriber.

Save the Heifers.

To the Editor:—There seems to be in many parts of the country altogether too much discrimination against heifer calves where stock raising is carried on in connection with other lines of farming. How often do we hear the farmer say, "How fortunate that calf is a male. It means more money for me and more beef for the butcher."

Now, what I am driving at is that this is an entirely wrong way of looking at the matter. Every strong, promising heifer calf has its value.

And in these times of scarcity in live stock their value is of no small importance. It is this same discrimination against heifer calves that has, in large measure, led to a dearth in cows in many places; even in long drives it is impossible to find good cows for the dairy in very large numbers. The farmer is and has been feeding up his surplus stuff into steers for beef and sending his heifer product quite early to the block, through the avenue of young veal or yearlings. Really you cannot sell your surplus heifers to the average feeder, for he

wants the steers, and will hound the country over for this beef product.

It is this procedure that is having a telling effect upon the cattle industry and if some of us are not headed round soon and induced to give more attention to the production and preservation of heifers the dairy business of this country will sooner or later suffer a critical shortage. In fact, in many parts of the country the effects are already being felt, in the scarcity of females, shortage of cream and butter products and tendency towards higher prices to consumers. Now let's all get together and do with our heifer calves as the old miser does his dollars, "hold them till the eagle squalls" and raise more and the first thing we know we will be up early in the morning milking and separating the cream and by noon have the cream check in hand for our labors, and then see if you don't feel better. R. B. R.

Dairying on the Institute Program.

Dairying constitutes one of the most important fields of all the agricultural life of our nation. There is not a single person who is not interested in some manner or means in production or consumption of dairy products. Scarcely is there a man, woman or child who attends an institute in one of our well-established communities but is pleased to see dairying or some of its problems have a place on the program. There is probably no other line of farm work that secures such universal attention as does dairying. Such being the case, it is well to begin early to plan that this important business shall have its rightful place upon the institute programs of all our countries.

The war has brought serious problems to the dairyman. To some extent each must right his problems alone and he must meet them in a manner peculiar to his own situation. Yet there is some help to be gained by rubbing shoulders and swapping ideas with fellow dairymen who may have encountered the same troubles, but have met them in a different manner. The speakers furnished by the state come with a message of useful [illegible] gestions and [illegible] pos-

variety of topics that are available as subjects for talks or papers. However, in many cases the problem of feeding is paramount in its interest. This year it is perhaps more vital. Everyone is interested in keeping down the cost of feeding and in producing a maximum milk flow. Some good dairymen hesitate to pay the prevailingly high price for dairy feeds wondering whether or not the returns in milk will justify the enormous expenditure of money. On this topic there is unlimited opportunity to use home talent. Every dairyman is buying closely and has figured a great deal. Out of numerous suggestions which will be made there are certain to be some valuable ideas.

The war has struck the help problem almost as a torpedo strikes the helpless merchant ship. In this again can the state speaker or local talent speak to very attentive audiences. In this connection a talk on experiences with a milking machine or a visit to a farm where a machine is in operation will be very acceptable. Thousands and thousands of times men have said, "If it were not for the milking I should be able to handle the situation." Perhaps the milking machine offers a solution. At any rate, it deserves consideration pro and con relative to its merits and demerits. In this, as in other topics, there is no place superior to an institute for threshing the matter out. Women are substituting for men in the barns or upon delivery wagons. No more timely topic is available than the possibilities of women assisting in dairy operations.

Coöperation is ever coming to the forefront with dairymen. They are neighborly and realize that it pays to work together. Possibly they are able to get feed at a lower rate per ton by buying in car lots and by paying cash. This has been done and a talk by some man in charge of this kind of work will mean dollars and cents to assembled dairymen. Coöperative buying of dairy stock and coöperative selling never lose their interest and the dairying of many sections is rapidly coming to a basis of united effort in this respect. Cow-testing association work and herd records never lose interest. In some places the institute is made the annual occasion for a complete public report by the tester or by some man well acquainted with the work relative to the results secured from the herds of the county.

The judging of dairy stock or a demonstration in judging is always very acceptable. A great deal depends upon the community as to what will be most acceptable in this line. Where dairying is in its beginning a demonstration by a capable man who will point out the points that are required to make a good cow is doubtless best. Where dairying is well established it is often advisable to hold a contest in judging dairy cows. Often it is possible to visit some farm for this work and in most cases the farm visits add to the interest and zest of the occasion.

The future of the dairy business is always a subject of interest. All realize that the future can be nothing but bright, yet there is a question in every man's mind as to how best to prepare for the future. He is not quite certain as to how best to meet it. Here is a topic upon which a man with extensive experience, broad [illegible] e of great [illegible] unity or individual men [illegible] some of the great problems of the business.

An institute usually has upon its program topics in which the people have shown the greatest interest. Such being the case it is manifest that people who desire to have dairying upon the program must express their desires to the institute chairman or to the program committ e. Doubtless it is well to begin early as the program might be filled if those interested were to wait until near the date of the institute. It is possible in the event that not a sufficient amount of time on the regular program can be devoted to dairying to arrange for a special day devoted to that subject. In this a combination of state speakers and local talent can fill a day perfectly. Dairymen should see to it that their interests have the share of attention which they deserve. Some preliminary work done in arousing interest and enthusiasm will insure that the institute will be a big event for the community.

Grain for Calves.

Whole milk is "nature's balanced ration" for the calf. When skim or separated milk is fed, other feeds are used to supply the fat which has been removed. Proprietary calf feeds or meal, for feeding with separated milk, have been put on the market. Many of these have merit, but by using the feeds usually found on the farm or in markets near by the farmer can generally mix a grain ration which is as good and costs less.

Wheat bran is a grain which is readily taken by young calves. Inasmuch as one of the essential points is to induce the calf to eat grain as early as possible, bran in many cases is one of the ingredients in the mixtures. Corn, a feed very commonly found on the farm, has an excellent physiological effect upon cattle of all ages and to a great extent may take the place of the fat removed from the milk. It is, therefore, one of the very best grains to use with skim milk. Experiments in Virginia tend to show that corn fed to calves should be cracked rather than finely ground. Cracked corn and wheat bran, therefore, should be the basis of the feed mixture. Ground oats are very good for the purpose, but they are not grown on the farm so commonly as corn and in many cases cost much more per unit of feed than corn and bran. The following mixtures are recommended:

1. Three parts cracked corn and one part wheat bran.
2. Three parts cracked corn, one part wheat bran and one part ground oats.
3. Three parts cracked corn, one part wheat bran, one part ground oats and one part linseed meal.
5. Five parts cracked corn, one part wheat bran, one part ground oats, and one part blood meal.
5. Oats, ground.

When the calf is in its second week it should begin to receive grain, and when one month old it should eat about half a pound a day. After this time the quantity of grain may be gradually increased, feeding the calf all that it will take until three pounds a day is reached; this will probably be some time during the third month. Grain, when fed with separated milk, should never be put into the milk. It is questionable whether the preparation of grain in any way, such as soaking or boiling, is advisable under any circumstances. Grain should be furnished in separate feed boxes so placed that it cannot be soiled by the droppings of the calf, but at the same time where the calf can get at it readily. There should be no corners in which wet feeds may ferment, and the utmost care should be taken to keep the grain fresh and clean at all times. —[United States Bulletin.

Lost Money on Hogs.

To the Editor:—Can't you persuade Mr. Hoover to step in between the hog raisers and the packers before it is too late? I have just finished one year of hard work raising hogs to help feed the people, and kept account of everything. I have just sold $2,000 worth of hogs and the expense was $2,300 in round numbers besides my time which I got nothing for. Now I want to be patriotic, but that doesn't pay for hog feed.

If I had sold my feed during the year at market price I would not have had to work the whole year for $300 less than nothing. I am not the only one in the same boat. We have lots of men who have given up and will not breed their sows. It is too bad that something cannot be done in time to save us in time of need.

I see Mr. Pinchot and one other man were turned down on their report to Mr. Hoover and both resigned. This has got to come and the sooner the better. Every hog in this locality has gone to market or to soft cornfield farther south. We can't buy any more corn of the farmers for $1 and haul it fifteen miles, which I did at the last, and it was half soft at that. Oats are 64 cents. I am feeding them to my pigs for winter feed. I have to clean up yet this winter and go out of the business if I can't get over 20 cents for hogs here at home. Not one hog in ten that left our market this fall has been finished pork.

Edmunds Co., S. D. A. L. Jones.

A Better Feed than Your High Priced Grains

KRAUSE Dairy Feed is a money-maker because it takes the place of your high-priced home-grown grains—gives your cows exactly what they need for big milk production and keeps them healthy and vigorous.

A Scientifically Balanced Ration

Krause Dairy Feed is the result of long and successful experience in the manufacture of dairy feeds. It is a scientifically balanced ration containing ten ingredients combined in such proportions as to form a perfect mixture—highly nutritious, easily digested, and one which your cows will relish and respond to immediately.

The ten ingredients in Krause Dairy Feed are Distillers' grains, Gluten feed, Cotton seed meal, Wheat bran, Malt sprouts, Wheat middlings, Brewers' grains, Hominy feed, Linseed meal and a fraction of 1% of salt.

Each of these ingredients has distinct and specific value and their combination under a formula which has been approved by experts of two leading agricultural colleges insures a feed upon which you can always depend for big milk production with no danger of forcing.

Krause Dairy Feed is a good business proposition for you from every point of view. It will save time, labor and money if fed alone, or you can use it with any home grown product which does not bring a high market price.

Give "Krause" a trial and you will make it the standard ration for your herd. It is safe, sure and profitable.

Write at once for free sample of Krause Dairy Feed, also useful pocket record book which every farmer should have. Be sure to give the name of your dealer

DAIRY FEED

Do You Know—

How to get a horse from a burning barn?

How to raise an orphan colt?

How to pick a good brood sow?

How to feed your cows to give the right color to your butter?

How to prepare cattle for shipment to avoid heavy shrinkage?

How to get rid of worms quickly?

How to pick a good dairy cow?

How to tell when pregnant animals will drop their offspring?

These and many other valuable questions are answered in a new Live Stock Book we have just issued and which we will gladly mail, postpaid, to anyone who will write for a copy.

It also contains record forms for keeping track of service dates, due dates for mares, cows, ewes and sows. Gives causes, symptoms and treatment of diseases of animals. In fact, is a very useful and valuable book for live stock owners.

It is a thorough treatise on worms in live stock. Illustrates the various kinds of worms—tells how they rob the animals of their food nutrition—how they cause fatal diseases—why they are the direct and indirect cause of over $200,000,000 live stock losses annually and 90% of all live stock diseases.

It tells why no farm or farm animal is free from these costly pests unless regular treatment is practiced. Tells how to get rid of them at very little cost and practically no labor.

It tells about SAL-VET—that wonderful "Veterinary Salt"—a medicated salt which has saved thousands and thousands of dollars for American farmers. How quickly it gets rid of stomach and intestinal worms; how it tones the blood and aids the digestion; how it helps every animal to thrive better, look better, grow and fatten faster and costs so little that it really is not an expense but a big profit maker for live stock owners.

"When I received the SAL-VET last Fall, my hogs were very unthrifty. However, they did not remain in that condition very long after I began feeding SAL-VET, since which time I never had hogs do better. My horses also began to pick up when I fed it to them. It surely does get the worms."
D. P. COPP, Carroll, Iowa.

Now, when feed prices are so high, you should get the most return from what you feed, but that is impossible when your stock have worms. They do not always show the worm symptoms plainly, so don't fool yourself by thinking your animals not affected.

SAL-VET will more than pay its cost as a tonic and conditioner, and in addition get rid of the worms. Ask your dealer about our money-back offer and learn why. That proves that SAL-VET is the cheapest and best live stock remedy to buy.

Preserve Your Breeding Stock.

Breeders Are Assured Liberal Profits for Hogs, Cattle and Sheep—By Arthur Leonard, President of the Chicago Union Stockyards.

MANY American farmers are making a big mistake. They have marketed too many brood sows, and now they are marketing too many pigs.

The recent marked increase in average weight together with a marked decrease in numbers, has been followed by much lighter average weight and increasing receipts at market. These facts are significant to those who study the hog situation.

A similar mistake is being made in the marketing of cattle. Too many beef cows are being sacrificed, and too many young cattle and beef steers that are in no better than feeder condition.

To the average American farmer the world war is still a far-off event. He has been too busy since this country entered it to be fully aware of the meaning of that fact, or to clearly realize its tremendous bearing upon American agriculture.

Thus far he has thought of the war mainly as it affects the labor necessary to produce and gather the crops he has planted and their market value.

When he does wake up to the true significance of this great struggle, he will see that preservation of breeding stock on farms is one of the most vital factors to all the people of every nation, in order that the world's rapidly disappearing supply of meats, wool and leather may be replenished. Everything points to a continuance of the war for some time to come. The world's needs will increase as the war goes on. Is it not plain that the demands upon agriculture for food and clothing will grow greater and greater with each month of destruction; that it will be impossible to produce an adequate supply, especially of animal products, such as meats, leather and wool, unless breeding herds are maintained, and that such demands and the needs for breeding stock to replenish the wasted herds and flocks will continue long after the war ceases; that this country must be looked to mainly for such supplies and breeding stock, and that those American farmers who are wise enough to realize this fact and prepare for the world's coming greatest needs which are inevitable, will reap the greatest rewards for their foresight, in both money and the gratitude of their fellow men?

The short-sighted policy, which strangles the bird in hand and lets those in the bush fly away; which, for the sake of a few extra dollars now, sacrifices breeding stock and thereby destroys the foundation for supplying the world's future needs, not only deprives this nation of vital necessities in its struggle to help the world, but also takes away the foundation for the abundant profits that would otherwise be the sure reward for waiting and developing the opportunity which is thus afforded.

Without sufficient seed, there can be no adequate crop of any kind. A world scarcity and greatly increased needs everywhere for all animal products can have but one meaning, and that is sustained market prices for all kinds of live stock during the war and for years after.

In measuring the farmer's supposed advantage in selling his old corn and animals separately at present prices for both, the effects of this short-sighted policy upon the future corn market, as well as on future hog prices, should be given careful consideration.

All authorities agree that about 80 per cent of the total annual corn crop of the United States is fed to live stock, about 30 per cent being fed to hogs in the principal corn-belt states.

That leaves only about 20 per cent, or less than 600,000,000 bushels, to be marketed as corn.

Now, suppose that only 70 per cent of the entire corn crop were fed to live stock, which would leave 10 per cent of same, or about 300,000,000 bushels more corn to be sold as corn.

That would mean an increase of fifty per cent in the quantity of corn thrown upon the grain market.

Now if we take into consideration the further fact that there is an estimated yield this year in the United States of 3,210,000,000 bushels of corn, which is an increase of 627,000,000 bushels over the crop of 1916, or 456,000,000 bushels over the previous five-year average, and to this increase we add the above increase of some 300,000,000 bushels which would ordinarily be fed to live stock, to say nothing of the millions of bushels heretofore used for making whiskey, alcohol, etc., it is easily seen that the usual quantity of corn thrown upon the grain market and sold as corn will be more than doubled during the season just about to open.

The amount of corn consumed directly as human food is so small compared to that fed to live stock, that any probable increase in the former would scarcely affect the proportions of the entire crop; so that, notwithstanding any such increase, and in spite of the great world demand for cereals, there is more than likely through the coming year to be a large surplus of corn thrown upon the markets for grain, with resulting declines in market value, while the inevitable coming scarcity of live stock at market, as the result of the heavy marketing, both last year and this, which leaves the shortage in the country, together with the greatest demand ever known for meats, leather, wool and all animal products and by-products, gives a positive assurance of sustained prices for live stock of all kinds.

Of course, market prices will fluctuate temporarily, but the readiness with which prices quickly recover from the effects of every overcrowding of the markets attests the sound underlying basis of values.

If growers generally will only hold their animals, regardless of temporary fluctuations, until ready for market, instead of rushing them in on every break for fear the good prices will end, and thereby tending to break the market, there would be comparatively even and regular market values at well-sustained levels and violent fluctuations would be avoided.

While there is no doubt concerning a general shortage of hogs in the country, yet the owners of hogs have little confidence in the future of market prices for hogs, while the disposition to hold marketable corn for higher prices is strong, and these two tendencies together are likely to produce within the next sixty days a considerable rush to market with young hogs, causing a temporary decline of prices, with resulting great scarcity afterward and still higher prices than now prevail.

The logic of the whole situation points to liberal progts for those who study it broadly in the light of facts and hold onto their young and feeding stock until matured and ready for slaughter, and especially so for all who have good breeding stock of any kind.

The whole world will be clamoring at their doors for it at almost unprecedented prices, both during the period of the war and for sometime afterward.

Bacon sells at retail in London for a price equivalent to 60 cents, while the normal price is only about 18 cents. If this indicates the relation of supply to demand it doesn't seem that hog raising can be overdone for some time to come.

HOGS GRIND GRAIN

Saves Grain — Saves Labor

Grinder and Self-Feeder

With the Hog Motor the Hogs can grind their own grain while feeding themselves and save 25% of the grain. A 40-pound pig can operate it. It will feed 30 hogs on full feed.

60 Day's Trial Without Risk

We positively guarantee to refund all money and pay freight both ways if you are not absolutely satisfied.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Timely Advice to Poultry Breeders.

To the Editor:—The time is at hand to think of next year's poultry crop. In the first place, you should select your best and most vigorous birds, also those that are the nearest to standard variety of fowls. For instance, take about eight or ten of your best females and a good active cock or cockerel and pen them away from the rest of the flock. Begin right now, don't wait until March or even later. By penning them early in the winter they get better used to their quarters and better acquainted and you will have better results. If every farmer would do this, what a splendid flock of fowls he would have, and by getting a new pure-bred male or a good setting of eggs or two once in a while from a reliable breeder he would soon have as choice a flock of fowls as there is in the country.

Also, the hatching season is to be considered at this time of the year. If you use hens for hatching you must have a place separate from the other flock of fowls so that they will not be disturbed by other fowls or some other noise. A setting hen wants a rather dark place and she does not want to be disturbed any more than is necessary. The nest where the hen is to set should be made comfortable with plenty of short hay or straw. Put a china egg or two in the nest and then take old Biddy (always in the evening) and put her on the new nest. She will take more kindly to the new nest if she is changed in the [illegible] see that the [illegible] leaves the nest once a day until the nineteenth or twentieth day; after that leave her alone until the twenty-second or twenty-third day, at which time all the chicks should be hatched if the hen has set well during the entire twenty-one days. It is well to run your hand under the hen after the chicks begin to hatch and remove all the egg shells, otherwise the shells sometimes slip over another egg that has been picked or not picked and the chick in that egg smothers.

A good many poultry breeders and farmers use incubators. Now, here, dear reader, I want to warn you, buy the best incubator on the market; that is, one that is built right and will hatch good, strong, healthy chicks. I have found that the best place to run an incubator is in a good basement, one that is well ventilated and has good, pure air. Always follow the instructions that come with the machine. I find in order to be successful with an incubator you must have a good brooder. You should also have a good brooder house to put the brooder in. I find that a coal burner brooder produces a uniform heat and there is no danger of smothering the chicks.

W. F. Gernetzky.
Columbia Co., Wisconsin.

Hints on Line Breeding.

To the Editor:—Most poultry fanciers are much interested in line breeding. As a fancier I believe to get good show birds you must line breed, but it is a thing that you must be very careful about. I believe in line breeding you can easily breed out of a good laying strain. A few years ago when I had been line breeding I began to notice that I did not have as good a laying strain, so I got a change of blood and I could notice the next year that I had a better laying strain. Also in line breeding your birds will not be as vigorous or as large. I think that when they are so line bred it is hard to get the eggs fertile and if your eggs are fertile the chicks are generally weak.

To get good show birds, however, you must line breed some, but not too much. About two years ago I used one male of new blood and one of my stock of the line bred and the eggs were more fertile from the bird of the new blood and the chicks were stronger and grew better. The eggs from the pen of the old line-bred stock did not hatch well, the chicks were not strong and did not grow as they should.

Clyde H. Davis.
Waukesha Co., Wisconsin.

Breeding for Exhibition.

To the Editor:—I find that many farmers have the idea that exhibition poultry are not profitable producers. I have found it to be the opposite, at least, with Buff Orpingtons. The Standard-bred Buff Orpington is essentially a practical fowl. The Standard calls for a full-breasted, deep-bodied bird of good length and a long, level keel, broad back of good length and width carried to the tail. Standard weights are: Cock, ten pounds; cockerel, eight and one-half pounds; hen, eight pounds; pullet, seven pounds.

As long as we stick to the Standard in our selection of breeding birds we will have a most practical fowl. The Buff Orpington is a great winter layer, a first-class setter and mother, and as a market fowl is unsurpassed.

A great many breeders have made the mistake of breeding considerably over Standard weight. By doing this they lose on the egg yield, the mothers are too clumsy as mothers, and they are too coarse and apt to be too leggy to top the market as a table [illegible] has been that [illegible]gton birds have [illegible]able, from the [illegible]point, as well

The breeder that can combine with this Orpington type the proper shade of buff with strong undercolor and more of the inner fancy points, such as proper color of eye, beak and earlobes, combs of good shape and free from side sprigs, legs free from feathers, stubs, etc., than his fellow breeders, is the man that wins at the shows and the successful breeder of exhibition Buff Orpingtons. All of these last-named points have nothing to do with the practical side of the breed, but make them pleasing to the eye as well as profitable.

If I were about to start breeding exhibition Buff Orpingtons, I would take in a few of the largest shows in my vicinity and spend all my time studying the winners, thereby fixing in my mind the proper Orpington type and shade of buff to breed to, at the same time getting acquainted with as many of the breeders as possible and getting all the pointers possible from them. I would then go to the breeder I had the most confidence in and who breeds his winners, not buys them, and buy a trio of birds mated by him, or a couple of settings of eggs from his best hens for my foundation stock.

They will not be perfect birds, as the perfect bird has not yet been produced. But if they are mated properly the male will be strong, where the females are weak. For instance, if the male is a little long legged and short in the back with the tail carried too high, the females will be a little low down with nice, long backs and low-tail carriage. If the females are a little weak in color of eye and have gray in the wing the male should be especially strong in these points, etc. But when it comes to color, do not mate a dark bird with a light female and expect good results. Procure as near the proper shade of buff in both sexes as you can afford to buy.

You can perfect your strain better by line breeding than by introducing new blood in a haphazard way each year. Do not breed any closer than cousins. For a few years go back to the same breeder for new blood and tell him just what points your birds are weak in, so he can send you birds strong in those points. Then later on if you see another breeder's birds that you like especially well, that, as a strain, are strong where yours are weak, buy a bird or eggs from him and mate carefully with yours, keeping strict track of the progeny by marking the little chicks with a toe punch, so that when they are developed and should not come up to your expectations, you can discard the whole lot without damaging your strain. On the other hand, if they should develop the qualities you are looking for you can infuse the blood into your entire strain, thereby improving it.

It is a great game and the more you study it the more interested you become in the race to produce the perfect bird. At the same time, you are doing your share in the improving of the general utility flocks of the country.

Selling your big, husky cockerels that fall short on the exhibition points to farmers improves their flock, just as the pure-bred sire is doing in every branch of live stock breeding.

S. D. Seymour.
Milwaukee Co., Wisconsin.

Kitchen Waste for Hens.

When kitchen and table waste is to be fed to poultry it should be selected and prepared with a view to getting its full food value and at the same time making it entirely acceptable to the birds.

Not all of the refuse and scraps from the kitchen is suitable for poultry food. Some things, as vegetable peelings, may be used when they constitute only a small part of the scraps, but when they are in excessive quantities it is better to dispose of them separately.

The same is true of coffee grounds and tea leaves. Fat meat in large pieces should not be put with scraps for poultry, because a hen can swallow a much larger piece of fat than is good for her. But cutting waste fat meat in pieces no larger than one would cut for himself at the table, and by making sure that the fat does not exceed ten per cent of the scraps fed at one time the dangers in feeding fat are avoided.

The best way to save kitchen waste for poultry is to keep a one-gallon jar, of glazed or galvanized ware, with a cover in a convenient place, putting into this scraps of bread, cake and meat from the table, remnants of servings of vegetables, cereals, pies, puddings, etc., and whatever waste from the preparation of meals is suitable to combine with these things in a mash.

Once a day the contents of the jar should be turned into a pail of appropriate size and as much ground feedstuff mixed with them as can be stirred in with a strong iron spoon or a wooden stirring stick. The amount and kinds of ground feeds to be used will depend upon the quantity of water with the scraps and whether any particular article predominates.

For thickening a mixture of scraps of ordinary variety a mixed meal of equal parts by weight, of corn meal, bran and middlings is good. If there is an unusual proportion of very rich food in the scraps it may be desirable to use bran alone for thickening. The more meal that can be stirred in and still have all the meal moist the better. Mixing can be done much more easily and thoroughly by mixing in a pail having a capacity about three times the amount of the scraps mixed at one time.

If the mash with scraps makes more than one meal for the flock, the pail should be kept covered until the next feeding. As a rule, it is not advisable to feed such a mash oftener than twice a day, but if mixed quite dry it may be fed three times. The occasion for this will exist only where scraps are so abundant that when thickened with meal they may be made the exclusive diet. This is not as good a ration as one containing some hard grain, but it may be used a long time without any bad results.

Even at the highest prices recently paid for hogs, skim milk fed to them is worth not more than 1 cent a pound. Yet one cent a pound, or approximately one cent a pint, is very cheap for any human food, and particularly for food so high in nutritive value as skim milk.

Is Your Truss a Torture?

Are you suffering the discomforts of rupture without any hope of relief? Then get the Brooks Rupture Appliance on free trial and know again the comforts of a sound man.

The automatic air cushion of the Brooks Rupture Appliance is held against the ruptured spot by a heavy elastic band. This air cushion clings closely without slipping or chafing. Guaranteed to comfortably retain the hernia at all times. The appliance may be washed without any injury. Draws and binds together the parted tissue and gives nature a chance to knit them firmly.

You need suffer no longer the discomforts of a steel truss. As specialists of 30 years' experience we have perfected a comfortable, sure relief from hernia in the Brooks Rupture Appliance. Endorsed by thousands of physicians.

SENT ON TRIAL

The Brooks Appliance is sent on free trial to prove its worth—you are the sole judge of its merit. Made to your measure. Durable—cheap. U. S. War Dept. has bought our appliance for 9 years.

Don't suffer any longer. Write today for catalogue and measure blanks.

THOUSANDS OF
American Housewives
Helped Write This Wonderful Cook Book of

FAVORITE RECIPES

Edited by
MARION HARRIS NEIL

FOR years and years, THE PEOPLE'S HOME JOURNAL has advocated the "Conservation of Food." We have always encouraged our million readers to send us their favorite recipes which we published from time to time. Finally we gathered together the most wonderful collection of tried and tested home recipes and now present them in one massive volume of over a thousand practical recipes bound in sanitary, washable sanitas, a book of over 400 pages, size 5¼ x 7½ inches, comprising 33 departments covering every branch of culinary art. This excellent Cook Book is

Edited by Marion Harris Neil

the Famous Expert and Recognized Authority, who is also conducting in the columns of THE PEOPLE'S HOME JOURNAL

War-time Classes in Economics

Approved by the Food Administration

It stands to reason that a Cook Book compiled as this one has been with tried and tested recipes sent from every corner of the land, combining as it does the cream of a million kitchens, and the wisdom of a thousand cooks, edited by a famous expert, should surpass in usefulness and practicability any other cook book which may have preceded it. The Favorite Recipe Cook Book is without a peer and is undoubtedly the most complete and comprehensive ever offered to the public. Included in the list of subjects authoritatively covered are: Soups, Fish, Meat, Sauces, Entrees, Salads and Salad Dressings, Meat Substitutes, Cheese Dishes, Economical Dishes, Left Overs, Emergency Dishes, Sandwiches, Chafing Dish Recipes, Bread and Biscuits, Fireless Cookery, Invalid Dishes, Baby Dishes, Beverages, Desserts, Pudding Sauces, Pies and Pastries, Cakes, Icings and Fillings, Ice Cream and Ices, Fruits, Candies, Preserving and Canning, Table of Proportions, Table of Weights and Measures, Time Table of Cooking.

FOOD CONSERVATION DISHES

We have included in this very up-to-date Cook Book a complete collection of Meat Substitutes to save the expense of meat without missing it from the menu. Economical Dishes—pages of them—that will provide many a delightful meal, at exceedingly small cost. How to use whatever is left over, and make it a substantial and pleasing part of the next meal, is fully told. There are dozens of unique Emergency Dishes, giving ready advice upon how to "prepare something in a hurry"—and do it so well that unexpected guests will be delighted! If baby's food does not agree, turn to the chapter on Food for the Baby, and learn what will agree. There are many dishes intended for invalids and a common-sense chapter on Preserving and Canning.

GIVEN

This wonderful volume of "Favorite Recipes" may be had without expense and will be sent post-paid to any reader of THE LADIES' WORLD who will send us one new two-year subscription (24 copies) to THE PEOPLE'S HOME JOURNAL at $1.50 for two yearly subscriptions at 75 cents a year, each one of which may be your own. Act quickly, our Edition is limited.

THE PEOPLE'S HOME JOURNAL

"A magazine for every member of the family" is a welcome visitor in more than 900,000 homes because the editorial contents of every issue are of unsurpassed excellence, including intensely interesting feature articles and a powerful COMPLETE NOVELETTE and gripping serial and short stories by celebrated authors, artistically illustrated by famous artists. The advice and practical assistance of the experts who edit the departments devoted to household problems will be found invaluable. Particularly the Department on WAR-TIME CLASSES IN ECONOMICS conducted by Marion Harris Neil and approved by the Food Administration and the Department of Agriculture, Washington. The other departments cover a wide range of subjects, including, among others, Mother and Child Interest, Home Development and Decoration, Fashions, Needlework and The Green Meadow Club, which is admitted to be the best page for children that is published by any magazine today.

UPPER WISCONSIN

Why Have Meatless Days in 1918?

To the Editor:—For years the number of sheep raised in the United States has been decreasing, while the demand for woolen cloth and for mutton has been on the increase until the demand has far outrun the supply.

Even in Australia the number of sheep has fallen off greatly owing to the death of a great number of sheep caused by the drouth. They tell me that if all the wool grown in the United States last year was made into all-wool cloth, not half of Uncle Sam's daughters could have a new wool dress.

There are many places in this country of ours that are well adapted to sheep raising.

In the western states the sheep men have been driven out by the homesteaders. There are thousands of acres of unimproved land in Wisconsin where sheep could be raised on the native grass and at the same time clean up the land.

Here in Upper Wisconsin splendid crops of clover, alfalfa, oats, corn and wheat can be raised that will carry the sheep through the winter and fatten them for market. There are excellent shipping facilities here, too. In Marinette county there are some sheep raisers making it pay. One of these men, Mr. Hardiman, is splendidly equipped for taking care of the sheep. He has a sheep barn that accommodates hundreds of sheep and he has 700 acres of land. Mr. Hardiman began his married life in the hills of Kentucky on rented land. Mr. Hardiman has sixty beautiful young ewes that he will carry through the winter and then give to two of his children to start herds for the coming year. The sheep Mr. Hardiman sold this year brought him $12 each and he got an excellent price for his wool.

Yes, mutton chops are high priced and so is woolen goods. Why not get a home of your own, you renters, who are paying higher rents each year, and raise sheep? Nothing succeeds like success. Let there be no more "meatless days" and let us fear no "eatless days."

Mrs. Lucy L. Ferguson.
Marinette Co., Wisconsin.

Part of the Hardiman Sheep.

Mr. Hardiman's Picturesque Home in Upper Wisconsin.

County Agent's Work in Ashland County, Wisconsin.

County Agent C. B. Post, of Ashland county, has filed with the county clerk a statement summarizing his activities for the fiscal year recently closed. Mr. Post's activities for the past year have been much the same as those of other county agents in Upper Wisconsin and have been directed along the lines of greater production of foodstuffs. Field experiments were not tried, but all efforts were centered on increased acreage and increased production. Last winter's work was not affected by the war. Mr. Post tested 235 cows for tuberculosis and found one reactor, a remarkable record for a

An Upper Wisconsin Sheep Barn.

county which is developing the dairy business as rapidly as is Ashland county. Mr. Post tested the cows of four herds for contagious abortion and spent from one to two days on each of nine farms disinfecting the barns and giving advice relative to the care of cows affected with this disease. The county agent advised with veterinarians and farmers and assisted in establishing preventive measures, which helped to control three outbreaks of hog cholera and two of blackleg. He also dehorned 76 head of cattle last spring. Throughout the year Mr. Post has continued the work of testing milk; securing pure-bred bulls and exchanging bulls from one farm to another in the county. He has assisted farmers, and more particularly new settlers, in securing good grade cows and heifers and in a few cases, pure-bred cows. With the assistance of bankers in Ashland county Mr. Post was able to place 34,000 pounds of dynamite in the hands of farmers, at cost. The Farmers' Equity, of Butternut, assisted Mr. Post in securing two cars of lime, which was distributed at cost to farmers of that vicinity. Mr. Post finds that whitewash sprayers are being used in dairy barns of the county, frequently, and ventilation systems have been installed in several instances and old barns have been remodeled. The county agent helped to organize one community club and encourage the work of three others, which had already been started.

Since the war began Mr. Post has brought into the county three carloads of seed potatoes and distributed same to farmers and gardeners, at cost. He has also proved that pedigreed seed grain is better than the ordinary varieties and he was able to place all seed ordered in the county from grain grown in the county and ship out 1,300 bushels of seed oats and barley. Farmers in the southern part of Ashland county are growing Marquis spring wheat with good results. When the Wisconsin Advancement Association put on their pedigreed winter wheat campaign this fall they secured one-fifth of their seed wheat, 1,000 bush[illegible] from the farmers of A[illegible]

The [illegible] work was done under the supervision of Mr. Post on nineteen farms and four of these farms were putting in tile drains. Four orchards have been pruned and sprayed with Mr. Post's assistance. Good crops were produced in three of these orchards; the other was badly diseased, but is recuperating nicely. Mr. Post also assisted in spraying infected shade trees in Ashland, but was obliged to give up this work in order to spend most of his time in the country. In Ashland county 411 school gardens were planted. The work was carried on with the coöperation of County Superintendent Hagman and Mr. Hedges, of Northland College.

The report which Mr. Post makes is his second and our readers will recognize that it is a good one. The report emphasizes the importance of county agent work in Upper Wisconsin.

Langlade County Potato Show.

That Langlade county can raise large yields of potatoes as well as those of high-quality was proven at the fourth annual potato show recently held at Antigo.

According to the latest government reports, Langlade county produced the highest yield of potatoes, averaging 160 bushels per acre, for any county in Wisconsin this year. But the members of the local potato growers' association and others interested in raising potatoes showed that quality can be combined with quantity.

This year it was more difficult than usual to exhibit potatoes, for the period of dry weather injured the shape of tubers and rendered it hard to find correct types. The shortage of help which affected nearly every farm, with a late season and harvest, kept many growers from selecting show samples at digging time.

The display of Rural New Yorkers was the largest, for this variety is perhaps the most popular of the late white varieties grown in this county. The quality and type of several samples was exceptionally good and demonstrated what careful culture and seed selection will do. Chas. Beard, Elcho, won first on this variety, with Louis Winter, Antigo, and Schroeder Bros., Antigo, R. R. 3, next.

The Irish Cobblers were second in number of exhibits, but equally high in quality. Cobblers are becoming more popular every year, for many growers are abandoning the late varieties owing to the long season needed to properly ripen. The earlier varieties, such as Cobbler, seem to combine yield with many other desirable qualities, so they will be largely planted by growers who formerly raised late stock. The silver cup on Cobblers went to Oscar Nelson, second place to Pete Krier and third to Chris. Sorenson.

Selecting Certified Seed Potatoes on a Langlade County Farm.

On account of the higher prices now paid for Triumphs this variety was the center of great interest. An exceptionally fine sample was shown by J. W. Smith, of Kent, while Louis Winter, Antigo, and Mrs. Chas. Parsons, Antigo, were the second and third winners. Triumphs, they say, do [illegible] newly cleared land [illegible] are not planted by [illegible] have been very ex[illegible]ivation for some [illegible] there are a few grow[illegible] having very good success raising this variety on old land and are being well paid for their trouble. At the present market prices Triumphs are selling for 50 cents more per bushel than other varieties. The southern trade demands this variety and are willing to pay well for good seed stock.

Burbanks, Green Mountains, Early Ohio, Early Rose were represented by only a few samples of each variety, but they were of fairly good type and quality.

The exhibit as a whole was more free from disease than at past shows and shows that growers are learning the advantages of treating their seed before planting.

The exhibit in the young people's class was large and the samples exhibited show that the boys are quickly learning how to plant and pick out the correct types of the different varieties. Harry Winter, Antigo, won the cup offered for first place, with Leonard Parsons and Willie Winters close contenders, all with good samples of Rurals.

E. L. Luther, superintendent of farmers' institutes, with J. W. Brann, field inspector for the Wisconsin Potato Growers' Association, judged the exhibits. Mr. Luther spoke at the annual meeting of the local association on the value of hill selection for seed and told of the good results he had obtained in this way while he was county agircultural agent of Oneida county. Mr. Brann gave the growers an interesting talk on potato diseases and the preventive measures which should be used.

A special feature of the show was a class for the largest rutabaga grown in the county. The largest baga, weighing over twenty-five pounds, was entered by Joe Florian, of Antigo.

At the business meeting of the association the following officers were elected for the ensuing year: President, Oscar Nelson, Antigo; vice president; Chas. Beard, Elcho; secretary, J. J. Garland, Antigo; treasurer, Chris. Sorenson, Antigo.

It was decided to send to the state potato show at Madison the choicest samples from the show and also make a county exhibit of the seed stock grown here.

One-third of the grain ration by weight should be made up of bulky feeds.

Successful Crops

You may be certain of big profitable crops if you adopt the most up-to-date method of seed grain treatment as recommended by the U. S. Dept. of Agriculture—

FORMALDEHYDE
The Farmer's Friend

This powerful disinfectant destroys grain smuts, rust and fungus growth. It prevents flax wilt, also scab and black-leg diseases of potatoes. It rids stables and chicken houses of disease germs and flies. Formaldehyde is surely a great boon to the farmer. Our Formaldehyde at your dealer, 35 cents in pint bottles will treat 40 bushels of seed. Big illustrated Hand Book sent on request—free.

What 15c Will Bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve-center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of **15c** in stamps or coin will bring you the Pathfinder **13** weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 25th year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send **15c** to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us; we are glad to invest in new friends. **THE PATHFINDER, Box 70, Washington, D. C.**

Usefulness

—not the price you pay—is the quality that will appeal on Christmas morning to father, husband, brother and that boy in camp or at the front.

And the *daily* usefulness of a KEEN KUTTER Safety Razor will make daily grateful thoughts of you. *It costs but $1.00,* in a neat case with 6 blades.

For mother, wife, sister or sweetheart—a KEEN KUTTER Manicure Set will create long-lasting appreciation of your thoughtfulness.

How Shall We Spend Christmas?

There is a great deal of talk these days about the matter of celebrating Christmas in the usual way by an exchange of gifts. Some are of the opinion that the demands upon us all, by those less fortunate than ourselves, are so great this year that no money or time should be spent in the purchase or preparation of gifts. Others are equally insistent that giving is the spirit of Christmas and that we should this year, more than ever, when there is already so much suffering and so much sorrow to tax our minds and hearts, bring pleasure and happiness to those we love and to those whom we have always remembered in a charitable way.

There is much to be said on each side and clearly this is a question for each individual to decide for himself according to his own conscience. It goes without saying that none of us are going to be extravagant this year, indeed, we do not even believe that an expensive or useless gift would bring joy to the person who receives it. We are afraid that such a person might say, "My friend loves me and I am happy in her love, but why does she not love me enough to share my gift with the unfortunates? Does she not know that I would understand?" For we do all understand, don't we? We all know that the world is crying for food and clothing and love, and if we make our Christmas gifts with thought not only for our friends but for the others—the hungry and the cold and the neglected—there will be Christmas cheer for all. As said before, we must each decide for ourselves, for, after all, it is only a question of how we can best spread the spirit of Christmas.

But we want to make one plea for the little folks. The children will be looking forward to Christmas. Some of them are old enough to have the grown-up view of doing all for others, but the little baby folks will not—it is only the happiness and the lighted candles and the Christmas greens that appeal to them. Here, again, we must fit our actions to the needs of the case. Christmas is going to take more thought in every household this year than ever before, but the extra thought and the extra planning and the full measure of charity and love that we are all going to put into our preparations, whichever course we pursue, are going to make it a wonderful Christmas—one that the Christ Child will look upon as a beautiful gift day in His honor.

The Silverfish a Household Pest.

Perhaps you have pulled out a book or some old papers and have seen a glistening, silver or pearl-gray insect vanish quickly down a crevice. And perhaps you have thought no more about the insect, but have wondered why the gold lettering on a book had a worn look or the surface of the leaves were scraped and roughened. Or it may be that you have found fabrics that have been packed away, damaged, and have been unable to account for it.

If such damage has been done or you have caught sight of such an insect it is well to institute a program of investigation and eradication.

This insect, because of its glistening body, its quick, gliding movements, and its ability to appear and as quickly disappear, has received a number of popular names, among which are silverfish, slicker, silver louse, silver witch, sugarfish, woodfish and bristletail. The silverfish is a real pest in libraries, particularly in regard to book bindings. They feed upon the surfaces of heavily glazed paper and eat off gold lettering in order to get at the paste beneath.

Its activities among fabrics is confined to starched clothing, linens, lace or muslin curtains and silks which have been stiffened with sizing. Also, they often eat the paste from beneath wall paper, causing the paper to scale off. It has been known to feed upon carpets, plush coverings of furniture, and even upon certain vegetable drugs.

It is seldom that the silverfish causes damage except where such articles as it feeds upon have been stored away and left undisturbed for a considerable length of time. It is most active in the summer because it likes warmth. In storerooms or in the case of houses that are closed for some time they multiply rapidly and the damage done by them is correspondingly great.

Since the silverfish causes injury to clothing, books, etc., in its attempt to get at the starch or glue in them, advantage may be taken of this craving to poison the insects by slipping into all the crevices where they occur—in bookshelves and backs of mantels, under baseboards and in the bottoms of drawers—pieces of cardboard on which a thin boiled starch paste, poisoned with powdered white arsenic, has been spread and dried. The department of agriculture gives the following formula for making the paste: Flour, one pint; white arsenic, one-half to three-fourths ounce; water. The arsenic should be added to the flour and sufficient water used to make a thin paste by boiling. Complete relief has

THE SILVERFISH.

been secured by this measure. In giving this formula the department lays special emphasis on the fact that great care should be exercised to keep the arsenic, the poison paste, and the poisoned bits of cardboard where young children will not get hold of them.

There is a powder called pyrethrum that may be dusted upon bookshelves or in drawers which is quite effective in ridding the premises of the silverfish, the only drawback to this method being the fact that the powder loses its power as an insecticide after long exposure to the air and must be renewed at frequent intervals.

Stored objects and fabrics that are liable to damage from the silverfish should be aired frequently to guard against the pest.

Snipe the Sniper.

Somebody is trying to snipe the canned goods of the American housewife. Now when the German snipers get busy on the western front, the boys are sent out to snipe the snipers. The women might try their hands at sniping these snipers of home-canned fruits and vegetables. Reports have been steadily circulated that the government will take over all home-canned goods in excess of family needs or levy a special tax on it. The department of agriculture and the food administration have repeatedly denied the story. Newspapers and farm journals have contradicted it, and still it keeps bobbing up.

The latest form of this sniping of food supplies is the report that home-canned fruits and vegetables are causing food poisoning. None of these stories have any basis, in fact. The reports may be put out to cover the work of thieves who are trying to frighten the women into giving up their supplies, or they may have their origin in German propaganda, or both causes may help to circulate the story.

Surely no sensible woman will be frightened into emptying her shelves for thieves, nor will she doubt her ability to tell when a can of fruit is "working." The best answer the women can make to this ugly propaganda is to refill the jars and thus snipe the sniper. Many things are available for canning in small quantities—pumpkin, squash, carrots, parsnips, spinach, turnips and, in the far South, many summer vegetables.

The food situation grows more serious. If the home pantry is filled, start a neighborly shelf. There will be dire need of food among our own people before the winter is over. Many a soldier's family will need help. Hungry neighbors serve the enemies' cause. So fill up the jars and snipe the sniper.

Tuberculosis.

Tuberculosis is caused by bacteria that thrive within the different tissues of the body, most commonly those of the lungs. The tuberculosis bacteria are a good deal like weeds in a field. The crop that has been well put in and is growing on a rich soil will smother the weeds at first if the crop has a good start. Poorly nourished plants are less able to fight the weeds. Tuberculosis bacteria find it hard to get a start on well-nourished tissue and if they get a start on poorly nourished tissue they can often be driven out by good nourishment. This means that the body must be well supplied with such nourishing foods as milk, eggs, meat, butter, vegetables, fat, etc., and that the person live in fresh air, as the food cannot be properly used in the body without fresh air. Sleeping in the open is very important. The person should also have rest so that all the nourishment from the food can be used to build up the body. It is well to remember that poorly nourished tissue is the most apt to be attacked by tuberculosis germs and that plenty of fresh air is as necessary to nourishment as is food.—[Agr. Dex. Dept. North Dakota Agricultural College.

To Help the Housewife.

When soaking salt fish, see that the skin side is uppermost, otherwise the salt will settle in the fish instead of in the water.

Before cleaning polished furniture with oil or furniture polish rub it well with a cloth wet with vinegar. This will remove the dirt and finger marks and greatly improve the finished appearance.

Use the flour left on your bread board after making bread or cookies for thickening gravies.

Save the paraffin from your jelly and preserve glasses for next year. Wash and store away. It can be melted and used again.

To clean light furs mix together two cupfuls of flour, two cupfuls of bran and one-fourth cupful of fuller's earth. Brush and shake the furs well, lay them on a table and rub in the mixture with a coarse piece of flannel, rubbing the fur the wrong way. Shake out the cleaning powder and go over the furs the second time, using only bran. Shake the bran out and wipe the fur with a clean cheesecloth.

If figs or dates are cooked with the breakfast food it will not take so much sugar.

War-time economy suggests to many women the utilizing of their husbands' worn shirts in the making of feeding and play aprons for small boys and girls. The back of the shirt cuts a good bib apron, fastening at the back with a snapper at the neck and tapes lower down.

Recipes for the War-Time Table.

Oatmeal Raisin Bread.—Two cups boiling water, one cup rolled oats, one tablespoon shortening, one-half cup molasses, one-half tablespoon salt, one-half yeast cake dissolved in one-half cup lukewarm water, four cups white flour, one cup rye flour, one cup raisins. Add boiling water to oats and shortening and let stand one hour. Add molasses, salt, dissolved yeast cake and both kinds of flour. Beat thoroughly, let rise, add raisins (stoned), beat again, turn into greased bread pans, let rise again and bake fifty minutes in a moderate oven.

Creamy Omelet.—Three tablespoons fat, three tablespoons flour, three eggs, one-half teaspoon salt, one and one-half cups milk. Melt fat, add flour and cold milk, stirring constantly. Cook until smooth and thick, add seasoning, and cool. Add well beaten yolk and fold in stiffly beaten whites. Turn into hot, well-greased skillet, cook until slightly brown and firm on bottom, then place in oven to finish cooking. Serve immediately.

Apples En Casserole.—One-fourth peck apples, one and one-half cups brown sugar, a pinch of salt. Wash and quarter, pare and core the apples. Lay in a casserole dish, cut side up; cover with the brown sugar and salt. Bake in a hot oven until tender.

Oatmeal Macaroons.—One cup sugar, two eggs, two and one-half cups rolled oats, one tablespoon fat. Mix dry ingredients. Add the eggs and the melted butter. Bake fifteen or twenty minutes in a slow oven.

Molded Rice With Raspberry Sauce.—Cook one-third cup rice with one pint milk in double boiler until very soft. Remove from fire, add one-third cup sugar and one-half tablespoon granulated gelatin, softened in a little cold water. Pour into individual molds and allow to cool.

Raspberry Sauce.—One cup canned raspberries, one-half cup water, one-fourth cup sugar, one teaspoon lemon juice, one-half tablespoon cornstarch, one-half tablespoon fat. Add water to the raspberries and cook until the boiling point is reached; remove from fire and strain. Mix sugar and cornstarch; pour the hot raspberry mixture over this, stirring constantly. Cook until mixture thickens; remove from fire; add fat and lemon juice. Cool and serve on molded rice.

E YOUNG FOLKS.

he Young Folks Are Helping

The other day a little eleven-year-old girl told us that she had just finished knitting a muffler for the soldiers. She declared she "though she would never see the day she finished it," but just the same she asked the Red Cross for more yarn for wristlets and now her needles are flying as busily as ever.

It isn't easy for a little eleven year old to sit quietly and knit when she might be spending the time at play, but we are proud that there are such little girls in our country and we are proud to know them. There are thousands of other little girls doing just what this one is and they are real little patriots and are helping Uncle Sam win the war, just as truly as their big brothers over in the trenches in France.

We know of little boys, too, who have scoured the country for gloves and other bits of kid, and leather and fur to make wind-proof vests for the soldiers. Many of the boys are running errands and doing such odd jobs as they can find to do to earn money to give to the Y. M. C. A. and various other funds that grow only when each of us does his duty. Some of the little boys and girls have even bought their own Liberty Bonds. These little folks are not asking father or mother to do their share—they are doing it themselves, loyally and bravely and happily. We are proud of all our boys and girls and wish they would write and tell us what they are doing.

Mamma's Helper.

Dear Young Folks:—I am a little girl twelve years old. I have brown eyes and dark hair. I have one little brother whose name is Lawrence. We have great times together.

I help mamma with the house work. I help wash and dry dishes, make the beds, carry in wood, cook, and do many other things about the house.

The children and I have great times together at school. We play rabbit and ball. I am in the seventh grade.

We milk six cows. We live two and a quarter miles from our nearest town.
Lorene.

The Farm Is Best.

Dear Young Folks:—I thought I would write you another letter to see what success I would have this time. I am a girl ten years old and live on grandpa's farm of 400 acres.

This year I raised a little garden and sold my vegetables to mother. I raised beans, onions, radishes and popcorn. My brother raised some watermelons, but the frost killed the vines before they were ripe. The frost killed mother's tomatoes too. I like to live on a farm so we can raise gardens. I wouldn't give up farm life for anything.

During vacation we went down in the woods fishing and one day my brother caught a great big fish. We go berry picking, too, and nut gathering. We go after the cows. Oh, there are ever so many nice things we do during our summer vacation. We go for many trips in the car and I like that very much.

We live two miles from town, where we drive to school every day. We drive a horse named Doll. Catherine.

Going to Have a Big Garden.

Dear Young Folks:—I am nine years old. I have read your letters many times and like them very much.

My father has a 320-acre farm seven miles from town. Next spring I am going to have a pony and mamma is going to have chickens and a cow. We used to have a team but we sold it and we have a car now. We are going to make a tractor out of it.

Next summer I am going to have a big truck garden. Paul Kenneth.

International Sunday School Lesson.

Lesson for December 9, 1917.

Ezra and Nehemiah Teach the Law.

LESSON TEXT—Nehemiah 8:1, 4, 5, 6, 8-12. Read entire chapter.

GOLDEN TEXT—Thy word is a lamp unto my feet, and a light unto my path. —Ps. 119:105.

The first day of the seventh month (8:2) was about October 444 B. C. Seven days feast (vv. 15-18) was the feast of the Tabernacles beginning the 15th of the seventh month (October) and continuing for seven or eight days (Lev. 23). Nehemiah was the governor; Ezra the scribe, chief priest; and Artaxerxes, king of Persia, ruler over Palestine. It would be interesting to look up the sudden injection of Ezra's name into this discourse; also the special reasons for teaching the Bible. There is in this chapter a record of a full week and of the daily events of that week.

I. The Preparation. Go back to verse 70 of the preceding chapter, and you will find that the temple had just been receiving some large gifts. The task of finishing the wall was also completed, all of which gives point to verse one, where it says that the people gathered themselves together as one man. This was an ancient open-air meeting, one we do well to study. The people requested Ezra to "bring the book." It needed no catch-penny operations to draw the crowd together. The writer of Nehemiah calls the book "the law which the Lord hath commanded unto Moses." (See v. 1 cf. v. 14.) This, of course, would include Leviticus, Numbers and Deuteronomy, an indication as to the Mosaic authorship of the Pentateuch, which is in line with the statement that Jesus Christ made that it was God who had written it as he had commanded Moses. It was not a mob; there was organization and equipment. (See v. 3 and 4.) The Bible was also read so that the people could understand it (v. 2); certainly something that is in demand in our present day. Ezra opened the book in the sight of all the people, for he stood on an elevation above them (v. 5) and read "distinctly."

II. The Reading of the Word. They read the book, not from some commentary or quarterly, though these have value in their place. The reading began with reverence. Reverence for but not a worship of the book. The Bible is not a fetish or a charm against sickness or accident. The verse "caused the people to understand the law," (v. 7) probably means that it was translated into the vernacular, the language of the common people. While God's word is a plain book and easy to read, nevertheless men of spiritual understanding are needed to "rightly divide" it unto the people (v. 7). However, the great interpreter of the Bible given by the Father is the Holy Spirit himself (John 16:12-15; I John 2:20-27). This method of beginning the study of the word and its continuance as presented in these verses is a good suggestion for modern Sunday school workers.

III. The Hearing of the Word. (vv. 9-17). As Ezra and Nehemiah and their associates and Levites taught the people, there was a five-fold result. First: There was conviction and mourning. The word of God always convicts of sin, but the people were told not to mourn over the past, nor were they to weep, for all the people wept (v. 9). When men hear the words of the law there will be conviction of sin. (See Eph. 6:7; Heb. 4:12.) Weeping may not, however, be conviction (2 Cor. 7:10). Weeping weakens, but that was not designed, rather the exhilaration of joy. Moreover, they were to seek the refreshment of food and drink. Indeed, the joy of the Lord was to be their strength (v. 10). "And there was very great gladness." (v. 17). In verse 11 we are told that the Levites exhorted the people to hold their peace, that the day was holy and that they should be grieved. To this the people responded (v. 12), and made great mirth, because they had understood the declaration of the word of the Lord. Notice that joy and gladness came after

New KEROSENE LIGHT FREE
BEATS ELECTRIC or GASOLINE

Here's your opportunity to get the wonderful new Aladdin Kerosene Mantle light FREE. Write quick for particulars. This great free offer will be withdrawn as soon as some distributor starts work in your neighborhood. You only need show the Aladdin to a few friends and neighbors; they will want one. AUSTIN SCHOOL OF COMMERCE, Austin, Minn.

obedience, also that Nehemiah, the governor, had a part in the teaching. It is a great thing for any people when their civil rulers are genuine, intelligent, and spiritual leaders. The people were instructed to show their gratitude as well as their piety by remembering "those for whom nothing had been prepared" (v. 10). The fourth result was peace (v. 11)—the peace of right relation with God (Rom. 5:1; Phil. 4:7).

Fifth Result: Service.

Mourning can very easily be continued too long, and, therefore, it was necessary to employ the emotion of mirth and the exercise of work that the people might enter into this peace. The fifth result, therefore, was service (v. 12). Notice that their thanksgiving portions and their service were based upon an intelligent knowledge of God's word. If there is anything that present-day social service needs, it is the illumination which comes from a knowledge of God's word. Last of all, worship (vv. 13-18). Worship is a compound of "worth" and "ship."

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Enclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date fall and winter 1917-1918 catalog, containing 850 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating thirty of the various simple stitches), all valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

1922—A charmingly attractive frock for mother's girl. The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. It requires 3¾ yards of 36-inch material for an 8-year size. Price, 10 cents.

1977—Ladies' apron. The pattern is in 4 sizes: 34, 38, 42 and 46 inches bust measure. It requires 7¼ yards of 36-inch material for a 38-inch size. Price, 10 cents.

2297—A simple, one-piece model. The pattern is cut in 6 sizes. 34, 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 7 yards of 36-inch material. Price, 10 cents.

Waist 2303-Skirt 2299—A stylish costume. The waist pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. The skirt in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. It will require 6¼ yards of 44-inch material for the entire dress. Two separate patterns, 10 cents for each pattern.

2316—A smart dress for the growing girl. Pattern is cut in 3 sizes: 12, 14 and 16 years. Size 14 requires 5⅝ yards of 44-inch material. Price, 10 cents.

2320—Girls' dress with or without jumper and with sleeve in either of two lengths. The pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. Size 10 requires 2¾ yards of 44-inch material for the dress and 1⅝ yards for the jumper. Price, 10 cents.

The Self-feeder for Fattening Sheep.

To the Editor:—In fattening sheep the self-feeder is a time and labor-saver. Before I used the self-feeder I had mangers with tight bottoms. These had to be cleaned out twice a day before the sheep got their grain. That took some time. Then in addition the grain ration had to be measured out and mixed twice a day, and as soon as they had the grain cleaned up the roughage had to be hustled into them.

With the self-feeder it is an entirely different proposition. The feeders have to be filled two or three times a week, but then we take time enough off to do it right, and after the job is done we are all free to do something else. In the granary we have a floor above where all the mill feed is thrown and the corn and cob meal as it comes from the grinder. We have a large grain box holding nearly 100 bushels. All that there is to do is to throw down so many scoopfuls of this and so many of that. The oats are kept in bins just below. All the feed is then mixed in the wagon box and the horses do the carrying for us. In the sheep shed there are two feeders along the sills. Windows are cut in the sides of the shed. We drive alongside and the feed is scooped through the windows. When the shed is full of sheep we have to have more feeders than these, so some portable ones are kept at hand, but these are placed as near the doors as possible, so the matter of filling them becomes easy.

Many object to the self-feeder on the ground that the gains so made are not economical enough, but I have never been able to see any difference unless it has been in favor of the feeders. Of course, when the feeder attendant is at all careless he is likely to lose a few lambs when starting them, and again if he does not watch pretty carefully they are likely to go when they are on full feed. If the water is off for a day or two and then they get a chance to fill up on it all at once common sense tells you that something will be doing. You must watch to see that they are feeding down properly or they may be without feed for a day or so and then to have so much all at once will nearly always give trouble. Any man who is fattening lambs, wethers or old ewes, must be careful, and the man with the self-feeder need not be more careful than any ordinary feeder should be if he is out for the most profit.

That is what I keep sheep for—profit. To be sure, I like them, but my love for them is not strong enough to cause me to keep them unless there was profit for me in them.

When starting a bunch on the self-feeder one must not feed too much concentrates. We use oat hulls at the start to lighten up the ration, gradually lessening the amount and substituting some other feed as the time goes on. Of late years corn and cob meal combined with oats has been one of my principal feeds, but lately I have been adding a few sacks of this molasses feed since wheat bran and shorts have gone so high. It is very hard to get mill feed at a price which will return profits. Screenings and that sort of thing are now being utilized for fancy chicken feeds and cheap flour at prices that the farmer cannot afford to pay, so it is best to try to have feeds of your own growing and mix them yourself.

The self-feeder, as a rule, results in quicker gains than the other way of feeding, and, even though the gains are no greater, if they are quicker this often means much when the market gets fickle on your hands.

It also means just as much when you care to stock up again as soon as the first lot is off your hands, and if you are not careful you will be anxious to stock up again soon when you once try the self-feeders out thoroughly. During the summer when it is desirable to feed the sheep some, nothing is quite so handy as the self-feeders in the field so they can go at will when you are busy in the fields with the crops. I have made some good money fattening sheep by feeding them grain while on pasture during the summer, as no food is required to maintain heat, and thus everything goes to making weight, and gains are easily and quickly made and at very low cost. There is much in having the cost of gains as low as possible, and no time is equal to summer for that.

Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

A. W. Arnold Sells Short-horns December 20th.

A. W. (CAP) ARNOLD will hold a sale of registered Short-horns at his East Side Farm, adjoining the town of Galvesville, Wis., on Thursday, December 20th. For this, his first sale, Mr. Arnold has listed a very useful lot of cows, heifers and bulls. Of the 30 cows that sell, 15 of them have calves at their side and are in calf again. It is only natural to expect these cows that are raising large calves to be a little thin in flesh, but they are big, roomy matrons and every one has a good udder and capable of raising a good calf. The calves are sired by Village Coronet, a two-year-old Scotch bull by Village Omega, out of a straight Augusta cow. The cows and heifers are also in calf to him. One of the good cows in the sale is sired by Prince Imperial. One of the real producing cows of the herd is of the Janesville Champion Rose family. She is the dam of a heifer that Mr. Harding purchased for export to South America. Some of the good heifers in the sale are sired by The Governor 351958, he by Village Marshal 302358. A cow of exceptional merit is by Merry Robin and tracing to Imp. Mazurka. A white heifer that has been in the money wherever shown is sired by White Rock. She is a three year old and a grand individual. A roan, 1915, by Scotch Cumberland, is one of the attractions of this offering. She will please the most critical. The cows have excellent udders and are good milkers. There are five two-year-old heifers in calf that are choice. Ten yearlings sell open. Of the bulls there are three that are good enough for the best herds. Village Coronet is the Scotch bull that has been used in the herd and he will be sold. Dale's Star is a senior yearling that was first wherever shown this fall. He was sired by Dale's Clarion by Double Dale by Avondale out of a Victoria cow. There will also be a roan senior bull calf in the sale, a full brother to the bull mentioned above. These bulls are outstanding in every respect. Besides these Scotch bulls there will be a number of real choice Scotch-topped bulls from heavy milking dams. It will pay you to investigate this sale offering. Read the advertisement on page 29 of this issue. Note the location as described in the advertisement. The catalog is interesting—get one at once and when writing please say you saw the advertisement.

[illegible] recently our [illegible] a few hours on this farm. Rag Apple Pontiac is without doubt one of the best young bulls in the state and we doubt if there is a better bred one, he being by Rag Apple Korndyke out of a 30-pound daughter of King of the Pontiacs. We have analyzed his pedigree in previous issues. At this time we wish to say something of the cow herd. In the herd is a fine large daughter of Homestead Jr. De Kol, a bull that needs no comment as a sire. This cow has an A. R. O. junior three-year-old record of 21 pounds and she is out of a 30-pound daughter of Piebe De Kol Burke. Her grandam has an A. R. O. of 32.20. Uneeda Korndyke Bertina made 21 pounds as a junior two and she is by the noted Johanna McKinley Segis. She is out of a 25.75-pound dam. Howtje Calamity Vale has a 27-pound record and is a full sister to a 30-pound cow. Jiebe Ormsby has made two 24-pound records and her dam has just made 28 pounds at ten years. Miama Mink has a junior three-year-old record of 25 pounds and milked 94 pounds in a day. Space will not permit us mentioning all of the good A. R. O. cows in this herd. They are safe in calf to Rag Apple Pontiac. At this time the Tulloch Farms offer a few good heifers safe in calf to the excellent bull mentioned above. They are priced very reasonable and should be good property, in as much as they will soon freshen to the service of one of the best young Holstein bulls in the Northwest. If you are interested, write for tabulated pedigree of this bull and information relative to the heifers. See page 30.—Adv.

Matthes Buys Son of Giant Invincible.

THE Duroc fraternity has heard of the sensational Giant Invincible, the largest junior yearling boar shown this year for which $2,500 was paid. Fred G. Matthes, Viola, Wis., one of the younger Duroc breeders of the state, and by the way, a real hog man, has just purchased a son of this sire for use in his herd. Mr. Matthes has scoured the country for a boar and we think he made a wise selection in buying this good boar. This is new blood for Wisconsin, as he is the only pig sired by Giant Invincible at the head of a good herd, in the state. Mr. Matthes will breed him to Pathfinder, Cherry Chief Wonder and King the Col. bred sows and he will certainly have aristocracy to offer next spring. He advises that he has had good sales, having shipped several boars to different parts of the state. He ships on approval, which goes to show that he has raised boars that he feels satisfied will give satisfaction. If you want a big, rugged Duroc boar and want to see him before you pay, write Fred G. Matthes, Viola, Wis., and please mention The Wisconsin Farmer. See page 31.—Adv.

J. Warren Hoyt's Milking Short-horns.

WHILE looking over Mr. Hoyt's milking Short-horn herd the other evening we were much impressed with the uniformly good individuals, which Mr. Hoyt has gotten together by careful selection and painstaking care. There was a progressive atmosphere around the Hoyt Farm and we were much interested in going through the new barn to find out that he had introduced the most modern equipment and that he had taken advantage of many labor-saving devices, which would do much to make regular work of the barn agreeable and pleasant. The Kitty Clay is one of the prominent families in this herd. Kitty Clay 47th bred by Flora V. Spencer, was purchased by Mr. Hoyt several years ago at the E. H. Urtous sale, Springcreek, Pa. She is the dam of Kitty Clay's Duke, the present senior herd sire. This animal is a particularly good individual possessing a decided dairy temperament as well as having a fine top line and good handling qualities. In view of the fact that Mr. Hoyt has used this animal as long as it is possible for him to do so advantageously he has decided to offer him for sale. Judging from the uniformly good yearling heifers that we noticed running out in the lot this sire is an animal which milking Short-horn breeders would do well to keep in mind as a prospective herd sire. About 80 per cent of Mr. Hoyt's herd are eligible to the double standard herd books. Mr. Hoyt also has Champion Rose blood and Young Mary's quite well distributed through his herd, which seem to blend quite nicely with the Kitty Clay strain which he introduced quite a number of years ago. Mr. Hoyt will price one bull calf, one yearling bull and six yearling heifers sired by Kitty Clay's Duke. See advertisement on page 27.—Adv.

Constance Can Supply Your Wants.

F. R. CONSTANCE & SONS, Waupaca, Wis., have several, big, rugged, well-grown Duroc boars for sale at reasonable prices. The season is "ripe" now for good farmer boars. By the first of the year the boar crop will have changed hands. If you want to take the "leavings" all right, but if you want boars that will be the means of improving your spring crop, get one of these boars being offered by Messrs. Constance. They are reliable breeders and The Wisconsin Farmer is glad to recommend them. When writing please mention The Wisconsin Farmer. See page 31.—Adv.

Field Men for The Wisconsin Farmer.

[illegible] R. [illegible], eastern half of Wisconsin. Address Room 201, Washington Bldg., Madison, Wis.

T. P. Shreve, western half Wisconsin and eastern Minnesota. Address 115 S. Main St., Janesville, Wis.

W. S. Steele, northwest Iowa, South Dakota, western Minnesota. Address Box 109, Sioux City, Iowa.

Fred V. Johnson, Wisconsin, Illinois, Indiana, Ohio, Michigan and Kentucky. Address 924 Hearst Bldg., Chicago, Ill.

Carlos C. Palmer, eastern half of Iowa and Minnesota and swine division in Illinois. Address 2714 High St., Des Moines, Iowa.

A. T. Cole, Missouri. Address 3900 Holmes St., Kansas City, Mo.

M. T. White, western Iowa and northeastern Nebraska. Address 4015 Izard St., Omaha, Neb.

W. A. Lawson, Rosendale, Wis.

LAST week while visiting breeders in the vicinity of Rosendale we called upon W. A. Lawson and spent a half hour very pleasantly looking over his herd of Guernseys. Mr. Lawson has a number of excellent foundation cows in his herd as well as a number of their heifers coming on that give the appearance of being promising prospects. Mr. Lawson's junior herd sire is a grandson of Golden Secret out of Lina Bettina, one of the high record cows in the West, having a record of 740 pounds fat. While looking over the surplus of Mr. Lawson's herd we discovered two young bulls sired by a son of Glenwood Stranford that has 21 A. R. daughters. One of these calves is out of a 500-pound cow, whose record was made on two milkings a day under ordinary farm conditions. The other is out of an imported cow having a record of 400 pounds. It will probably be remembered that Mr. Lawson is in company with Mr. Wells and Mr. Hill that purchased the well-known senior and grand champion Guernsey bull at the state fair this year. May King Vrangue of Ingleside was formerly owned by Fruit Brothers, who have a number of his daughters that have made a wonderful showing in A. O. work. We were also interested in looking over Mr. Lawson's herd of Berkshires. Though not large in number they were of exceedingly high quality.—Adv.

Hoskins, of Dodgeville.

WE have just had a letter from Art G. Hoskins, Dodgeville, Wis., advising that he has ten Chester White boars that he wants to get in the hands of men that appreciate good boars. They were farrowed the fore part of April and weigh from 160 to over 200 pounds. Hoskins has a good herd of Chesters and he can send you a boar that will please you. He is not holding out for big prices, but wants to sell these on short notice. Here is a chance to get a good spring boar worth the money. See page 27.—Adv.

Charles A. Peterson, Rosendale, Wis.

IT probably is not known by all of the Jersey breeders of Wisconsin that Mr. Peterson has been appointed Jersey Extension man for the state of Wisconsin by the American Jersey Cattle Club of America. We feel that the club could not have made a better selection in view of the active manner in which Mr. Peterson has taken hold of the work of developing Jerseys, particularly his own herd. Those who watched the judging of Jerseys at the state fair this fall will recall distinctly the fact that Mr. Peterson's show herd gave an excellent account of itself amid the keenest competition of all the dairy judging at this fair. His two-year old, Glory's Pearline, was third at Iowa, shown as a dry cow, second at Minnesota when she was springing and was first and senior champion at Wisconsin, defeating grand champion cow at Minnesota. Ibsen's Pearl, a three-year-old cow, likewise gave a good account of herself at the fall shows, being first at Minnesota, in both the open and register of merit classes. His yearling and two-year-old bulls were also first at Minnesota. Ibsen's Chief was first-prize two year old and grand champion in the Jersey specials class, which means that this animal according to the A. J. C. C. ruling had to be owned at least one year by the exhibitor prior to the show. One of the most promising heifers in Mr. Peterson's herd at present is Glory's Autumn Sunshine by Ibsen's Glory and from a 700-pound dam. We cannot help but feel that the Jersey interests throughout the state should in every way possible coöperate with Mr. Peterson in giving him an opportunity to make his enthusiasm for the best interests of the breed felt throughout the state. Locate communities wishing assistance in conducting interesting meetings should get in touch with Mr. Peterson at once regarding such matters.—Adv.

Smiley Boars All Gone.

WM. SMILEY & SONS, Albany, Wis., advise that they are sold out of spring boars and change their advertisement accordingly. One of the sons lives at Rockton, Ill., and he is a breeder of Polled Durham cattle. Just at this time he has for sale a number of bulls of serviceable age that he is offering for quick sale. He has reds and roans and will gladly answer any inquiries. Write Jas. B. Smiley, Rockton, Ill., and mention The Wisconsin Farmer.—Adv.

Reese Has Gerstdale Jones Boar.

LOUIE L. REESE, Brooklyn, Wis., spent the price of a good boar in railroad fare during the past few months, looking for a herd boar. Not that he did not see good boars, but Reese is a critical buyer and will not buy until he finds what he wants, then he will pay the price. He visited McDonald's herd and saw the litter Mac had by Gerstdale Jones and Reese found what he was looking for. If you want to know what Gerstdale Jones boars are worth just read the reports of sales where boars of this breeding have been sold. Spring boars by this sire have sold as high as $2,500. Gerstdale Jones boars will add prestige to any herd. Mr. Reese has sows by Fessy's Timm, A Wonder, King of Wonders and others of popular breeding. They will be bred to this boar and he will certainly be able to make some "noise" when the pigs begin to come next spring. Don't forget that Louie L. Reese has a good herd of big-type Polands.—Adv.

Bates Short-horns.

B. W. LITTLE, Janesville, Wis., owns a strictly Bates bred herd of Short-horn cattle. Those that are interested in the milking Short-horns have read about the cow, Rose of Blackwood, the Minnesota Short-horn cow that just completed a yearly official record, giving in that length of time 17,656 pounds of milk. This was in competition with over 700 cows of all breeds. This cow is a descendant of the well-known Thos. Little herd and B. W. Little now has the herd made up of the same line of breeding as the cow that just made this record. A cow in the Little herd just completed her yearly record and gave 13,300 pounds. Her dam was by Dairyman, the sire of Dairyman Jr. Mr. Little has some bulls of serviceable age for sale. They come from the line of breeding that has made good for the past century. Write B. W. Little and please mention The Wisconsin Farmer. See page 27.—Adv.

What Wm. M. Knight Is Doing With Jerseys.

WM. M. KNIGHT, Eagle, Wis., has been engaged in breeding Jerseys for 12 years and has assembled a herd which in point of individuality will compare favorably with any in the state. Two years ago Mr. Knight was very successful in the show season and last year his herd took most of the blue ribbons at seven county fairs. Eminence Safety Belle 2d, first in her class at Milwaukee and at seven county fairs last year, is an outstanding individual in this show herd. Trial's Noble of Oaklands 2d also completed an unbroken record last year and his junior heifer calf, Trial's Pretty Maid, finished the circuit with the same distinction. Mr. Knight's herd sire, Trial's Noble of Oaklands, showed this year as a two year old and was first and champion at seven county fairs and second in class at state fair. Not only as a show herd, but also on records, Mr. Knight's herd has made a wonderful showing. The following is a partial list of some of the records which have been made on the Oak Grove Jersey Farm. Eminence Desirable at 15 years made 425 pounds of butter, 8,350 pounds milk in 248 days; Volunteer's Nellie has a record of 447 pounds of butter, 7,394 pounds of milk; Volunteer's Sally, 597 pounds butter, 9,540 pounds milk; Volunteer's Lottie, 443 pounds of butter, 7,911 pounds milk in 331 days; May of Oak Grove at two and a half made 621 pounds butter, 10,089 pounds milk; Sally of Oak Grove two years and two months made 594 pounds butter, 9,660 pounds milk, state record when made; The King Sons Girley, two years nine months, 392 pounds butter, 6,002 pounds of milk; Coffey of Oak Grove two years three months, 447 pounds butter, 7,207 pounds milk; Commander Sally, two years four months, 393 pounds butter, 7,349 pounds milk, and Fancy Lock, one year 11 months 346 pounds butter, 5,091 pounds milk. In addition to these records The breeding in Mr. Knight's herd consists mostly of Noble of Oaklands and Eminence strains and the present herd sire is Trial's Noble of Oaklands 2d, sired by the noted $15,000 bull, Noble of Oaklands and out of the splendid cow, Trial's Sweet Bread, that has a record of 563 pounds butter and 8,492 pounds milk in a year. A partial list of animals which Mr. Knight will sell at present is as follows: Trial's Noble of Oaklands 2d, the remarkable prize-winning calf previously referred to; a prize-winning yearling bull whose dam has 658 pounds butter; several other choice young bulls out of high record dams and several heifers. Most of these youngsters are sired by Trial's Noble of Oaklands 2d. See page 28.—Adv.

Special Price on Fall Pigs.

L. P. MARTINY, Chippewa Falls, Wis., advises that he has had a good trade in spring boars and is about sold out. The demand is for the get of his great breeding boar, Big Bone Wonder. Just now Mr. Martiny offers about 40 fall pigs of September farrow. If you will note the advertisement on page 31 of this issue you will see just what he has for sale. Don't forget that Martiny has the popular big types and is using three real outstanding herd boars. We are always glad to recommend Mr. Martiny and his stock. Every one knows about his high-class Guernsey herd and if you need a young bull, this is the time and place to write—get busy. Don't forget to mention The Wisconsin Farmer, please.—Adv.

O'Brien Buys Gerstdale Jones Boar.

J. J. O'BRIEN, Madison, Wis., is the man that owns the best junior yearling Poland China sow in the state. His sow herd throughout is of the most popular breeding, so he wanted to get a boar that would be in keeping with his sows. Gerstdale Jones is the big noise at the present time. Besides being a wonderful breeding boar, the fact that he recently sold for the record price of $6,600, has made him a by-word among Poland China breeders. Mr. O'Brien is to be congratulated on his good judgment. His advertisement appears in this issue. Keep O'Brien in mind when thinking of big-type Poland Chinas.—Adv.

Stump Puller for Land Clearing.

A STUMP puller that is admirably adapted to the needs of the farmer is the "K" hand-power stump puller, manufactured by W. J. Fitzpatrick, of San Francisco, Cal. It weighs but 171 pounds and can be wheeled about like a barn truck. With one of these outfits Thos. Cunningham, farm manager of the Western Fuel Company, pulled down a fir tree in eight minutes. Although the machine was purchased only recently, he has already cleared 30 acres of land with it, with no expense whatever for repairs.—Adv.

Charles L. Hill, Rosendale, Wis.

WHILE passing through Rosendale last week we ran across Mr. Hill coming in from his farm and indulged in a little chat on the latest news in the Guernsey world. Mr. Hill is generally recognized as being the best

informed man on Guernseys in this country. It was not surprising, therefore, that we should be able to obtain some interesting information with reference to the development of the Guernsey industry in Fond du Lac county. Mr. Hill stated that an importation of Guernseys had just left the quarantine in New York for Fond du Lac county the day of our visit. With a few exceptions these animals will be distributed in Fond du Lac county—the rest going to Winnebago county.—Adv.

Trutschell Bros., Sheboygan Falls, Wisconsin.

WHILE walking behind the cows of Trutschell Brothers' herd last week we were confronted by the following placards, which were printed in large letters and posted at the head of the respective cows entitled to these records. Our attention was first called to the grand old foundation cow, Bessie Wa Wa De Kol, a 26.93-pound cow that has by her side three outstanding daughters; one is Earl Rigtje Belle with 32.40 pounds in seven days; Eagle Rigtje Pearl, 29.26 pounds, and Eagle Rigtje Viola, 24.42 pounds as a senior two year old. Other cows, some of which have even greater records to their credit, that claimed our attention are as follows: Eagle Rigtje Jessie, 32.71; Rigtje Daisy De Kol, 33.70; Eagle Rigtje Yesletime, 29.50; Eagle Rigtje Queen, 29.20 and Eagle Rigtje Beauty, 29.15. Trutschell Bros. are now using at the head of this splendid herd, a 34.42-pound son of Pinehurst Piebe, the noted cow of the former Pinehurst Dairy herd. The sire of most of the cows, whose records have been given, was Sir Rigtje of Pinehurst, whose dam had 918 pounds butter, 23,000 pounds milk in a year. It is evident, therefore, that the five eight months old calves now owned by Trutschell Bros. have exceptional good yearly backing. Breeders looking for size, good individuality, large seven-day and semiofficial yearly backing should keep this herd in mind when looking for a good herd sire.—Adv.

Milford Meadows' Holstein Herd.

MR. BLAINE is just completing a large modern barn, 172x38 feet, which will contain eight stalls for test cows and a feed storage room accommodating six to eight carloads of feed. Those who have had an opportunity of visiting the Milford Meadows Stock Farm will remember that they were already well equipped before the erection of this new barn and that they are now in a better position than ever to develop the animals in their great herd. The last time we visited this farm they had on hand a number of choice young bulls from their best cows, which were strong in the breeding of Wisconsin's great herd sire, Homestead Junior De Kol. For size and uniformly good individuality we do not believe that this breeding can be beaten. In fact at the last Lake Mills Holstein sale, a young bull bred along these lines sold for $3,000, one of the best sales ever made by the Lake Mills Holstein Company. It would, therefore, pay farmers and breeders alike before selecting their herd sires to write to the Milford Meadows Stock Farm for a complete sale list of their young bulls, as in so doing they will be given a wide range of animals from which to make selections. These animals are not priced beyond the average farmer except in particular instances where their dams happen to have exceptional records. See advertisement on page 30.—Adv.

Madson Has Great Boar.

SOME time ago Madson & Sons, Madison, Wis., purchased a spring boar sired by Bill's Chief, a son of that good sire, Mouw's Chief. Bill's Chief is a half brother to Chief Defender the Illinois grand champion. This was one of the best big-type spring boars the writer saw this spring and we have been advised that he has made a wonderful growth since the Madsons began to grow him out. Good gilts are being bred to this boar and, as they will not hold a bred sow sale this winter, these gilts are for sale. They have a few spring boars yet for sale and they will guarantee to please you if you want a big quality boar. Write them and say you saw the advertisement in The Wisconsin Farmer. See page 31.—Adv.

Geo. Goelzer, Plymouth, Wisconsin.

MR. GOELZER, who has a splendid modern, up-to-date barn on his farm, has also seen to it that he has an up-to-date herd sire at the head of his herd. He is now using a 33-pound bull, which is from one of the best cows in the well-kown Trutschell herd. We feel that Mr. Goelzer has taken a correct step in selecting so worthy a herd sire, and the offspring from his good cows by this sire should be tripled in value. We were also impressed with a number of good aged cows in Mr. Goelzer's herd, which in no small degree are responsible for the good lines possessed by the young stock in this herd.—Adv.

A Saving in Feed Cost.

WHEN live stock drink ice cold water in winter time, the water takes a large amount of heat from their bodies which must be replaced by heavier feeding of expensive heat-producing foods. A Cowboy tank heater will temper the water and thereby save this expense of extra feeding. It's an investment that soon pays for itself. It is absolutely safe and so reasonable in cost that every stockman can afford to have one. Learn about the Cowboy heater at once by writing to The Willis Mfg. Co., 52 Seventh Street, Mendota, Ill. See page 18.—Adv.

Bloomington Horse Sale.

MGR. C. W. HURT, advises us that the annual sale of draft horses under the management of the Breeders' Sale Co. will be held in Bloomington, Ill., January 22d to 25th, inclusive. Particulars will appears later. Applications for entry blanks, etc., should be made to C. W. Hurt, Arrowsmith, Ill.—Adv.

A. L. Williams' Estate, Fond du Lac, Wisconsin.

WE were greatly pleased while visiting the A. L. Williams Estate last week to find that C. A. Williams, his son, and executor of the estate, is taking hold of things in such a way as to continue the splendid work started by his father. The breeding of the two herd sires now in use indicates the farsightedness of the one directing the breeding operations of this herd. The senior sire, Dutchland Colantha Belle Boy, is practically a 28-pound son of Colantha Johanna Lad, one of the most noted herd sires in the East. This animal is a handsome individual well marked, and is the sire of a number of very prominent animals that are used as herd headers throughout the state. Mr. W. H. Stiener is now using a 30-pound son of this bull. The junior herd sire now being used on the Williams herd is Colantha Sir Aaggie Rag Apple, a grandson of Colantha Johanna Lad and a 33-pound son of Colantha Sir Aaggie, another of the noted sires used in the D. W. Field herd. A great per cent of the cows in Mr. Williams, herd are daughters of the senior herd bull so that the young stock on hand at present are especially strong in the Colantha Johanna Lad breeding. We question if there is another herd in the state that contains a higher percentage of the blood of this noted sire. Mr. Williams is now offering for sale five young bulls, including a 25-pound son of the junior sire.—Adv.

Bonne Meade Stock Farm, Randolph, Wisconsin.

ONE THOUSAND DOLLARS will buy three exceptionally high-class cows bred to a full brother to Pietertje Maid Ormsby, generally known as one of the greatest cows in the Northwest. We have visited the Bonnie Mead Stock Farm several times during the last six months and have been much impressed with the get of the sire to which these cows are bred. At present they have as nice a lot of yearlings sired by this bull as you would wish to look at. Considering the individuality of the cows referred to and their ability to produce we feel that they are a good buy at the figure quoted. See advertisement on page 30.—Adv.

Emil Titel, Plymouth, Wis.

WE have always known that Mr. Titel has been doing some splendid yearly work, but were never so forcibly impressed with this fact as we were last week while looking over his splendid array of yearly record cows. It will be remembered that two years ago it was Mr. Titel's cow that stood first in the cow-testing asociation contest at the Wisconsin State Fair. She would have been also first this year had she not been barred from entry. The dam of this cow as well as her sister make a trio, which in the point of individuality and high yearly records have scarcely an equal in the breed.—Adv.

Anoka Champion Brings $17,000

All Short-horn Records Broken at the Anoka Farms Sale, Waukesha County, Wisconsin, December 1st.

SHORT-HORN public sale records went glimmering at the 16th annual sale at Anoka Farms, Waukesha, Wis., December 1st. A representative attendance of Short-horn breeders and admirers was on hand, every section of the United States and Canada being represented. They were there expecting to have an opportunity to place values upon a great lot of cattle, and they were not disappointed. The value of the offering is best evidenced by the fact that of the 45 head sold, 28 sold for $1,000 per head or better. It was a day for making Short-horn history, and the result of the sale is the best possible evidence of the present stable condition of the breeding business, and emphasizes more than ever the fact that Anoka Farms may well be considered the fountain head for all that is best in Short-horns. The main interest of the sale centered around the prize-winning Champion of Anoka, the yearling son of Sultan's Stamp, and out of a dam by Leader of Fashion, making him a double bred Whitehall Sultan. He was started at $5,000 by Harry Hopley, of the Hopley Stock Farm, Atlantic, Iowa, and was quickly carried up to $12,000, the bidders being Mr. Hopley, J. W. McDermott, Kahoka, Mo.; J. H. Degginger, Albany, Mo., and B. F. Hales, Chicago, Ill., who owns a large farm and herd of high-class Short-horns at Prairie View, Ill. At $16,000 Mr. Degginger dropped out, and the bull went to Mr. Hales on a bid of $17,000. This is the highest price ever paid in this country for a yearling Short-horn calf. Mr. Hales was a strong contender on most of the older females, his total purchases for the day amounting to $26,475, he buying seven females in addition to the bull. W. L. Smith, Utah, Ala., paid $5,000 for the yearling Royal Stamp by Crystal Stamp, and Carpenter & Carpenter, Baraboo, Wis., secured Masterpiece, a yearling Orange Blossom by Right Sort, for $4,000. The top for females was $2,600, paid by Mr. Hales for the January heifer calf, Augusta Anoka by Crystal Stamp. He also paid $1,650 for Augusta Anoka 6th by Rusper Champion, and Lespedeza Farm, Hickory Valley, Tenn., gave a like sum for Anoka Proud Lady, a yearling daughter of Collynie Mine. The detailed sale list makes interesting reading, showing as it does the very wide range of distribution of the cattle, they going to buyers from every corner and section of the country, and the remarkable uniform range of values. Eliminating the $17,000 paid for Anoka Champion leaves 44 cattle selling for $52,975, or the sensational average of $1,203 per head. Pres. Reid Carpenter, of the American Short-horn Breeders' Association, made a very pleasing talk at the opening of the sale, and Mr. Harding, while thanking the people for their attendance, said that any credit for the excellent condition of the cattle should go to Manager Sim and the other men who had them in charge. It was another demonstration of the prepotency of the Whitehall Sultan blood, as the majority of the animals in the sale were closely related to that champion sire. Like all events at Anoka Farms, every detail was carefully looked after and there was no hitch from start to finish. Another great success can be credited up to this progressive and creative breeding establishment, and the Short-horn fraternity generally can congratulate themselves on having to their credit so successful and clean a sale. Col. Carey M. Jones sold the cattle and certainly did his work in a most masterful way. He had the able assistance of Col. Fred Reppert. The detailed sale list follows:

FEMALES.

Fanny Anoka, calved 1916; Edellen Farms, Lake Forest, Ill.	$1,125
Columbia Anoka, calved 1916; McMillan & McMillan, Lodi, Wis.	1,100

Crimson Duchess 38th, calved [illegible]	[illegible]

SHORT-HORN CATTLE.

Short-horn Steers Break World's Record

FORTY SHORT-HORN STEERS, weighing 1,692 lbs., bred in North Dakota, fed in South Dakota, topped the Chicago market July 9th at $14 per cwt., averaging $236.88 per head. They were part of a shipment of eighteen loads of Short-horns, 263 head, which sold for $55,025.39, averaging slightly under $210 per head. Market authorities pronounce this performance without a parallel for all time and regardless of breed. The Short-horn is the breed for you.
AMERICAN SHORT-HORN BREEDERS' ASSOCIATION 13 Dexter Park Ave., Chicago, Ill.

Burbank—1st Leonard [illegible] tigo, R. R. 1; 2d [illegible]

Tractor Saved Two Teams.

To the Editor:—In regard to the tractor, we think it is a profitable investment. We have an 8-16 and have plowed with it in the last two years over 300 acres, pulling, most of the time, three fourteen-inch bottoms, and have double disked, pulling two fourteen-blade disks on the plowed ground. Besides, we have put in all our small grain, disked stalk ground, dragged roads (pulling two seven-foot drags with 150 pounds weight on each drag), and have graded roads with a large grader.

Up to date we have had less than $20 expense for repairs. In plowing, pulling three fourteen-inch bottoms, it takes 2.7 gallons of coal oil per acre, twenty-seven gallons for ten acres or one day's work. Doing other work it takes twenty-five gallons a day. Coal oil costs us on an average 8½ cents per gallon. We use on an average one gallon of lubricating oil per day, which costs us 26 to 28 cents a gallon in half-barrel lots.

We also use our tractor for stationary work, such as sawing wood, grinding fuel, shelling corn and other work.

In using our tractor we have saved two teams the year around and if we could plow corn with the tractor we would be able to do all the work to be done by horses with one team.

In our estimation, the tractor is a very profitable investment.

The Wisconsin Live Stock Breeders' Association has appointed a war committee composed of experienced feeders and handlers of live stock, who will appear with the agricultural committee in the State Council of Defense. The committee is composed of James Dillon, Mondovi, representing swine interests; Ralph Reynolds, of Lodi, representing the beef interests; Wm. F. Renk, of Sun Prairie, representing the sheep interests; Walter L. Houser, Mondovi, representing the horse interests, and S. H. Bird, of South Byron, representing dairy cattle interests.

Dairy cows must be kept quiet and never hurried or worried.

In Your Herd Means Dollars in Your Pocket

The Pabst Stock Farm Herd is of the famous King Pontiac Champion strain.

Progressive Breeders seek Blue Blooded Stock.

OAK GROVE JERSEY FARM

WM. M. KNIGHT, Proprietor, EAGLE, WISCONSIN

SHOW RING PERFORMANCE

Our herd has been shown at the leading fairs of the state since 1915 and has invariably taken the lion's share of the blues. This year our yearling heifer, **Eminent's Safety Belle 2d (390457)** was first at seven county fairs and the Wisconsin State Fair. Likewise our get of sire, two-year-old and senior bulls, aged cows and junior bull calf were first at all the county fairs and made a strong bid for first place at the state fair. **Trial's Noble of Oaklands 2d (155214)**, junior bull calf, in fact, was first everywhere he was shown. The consistency with which our herd has been winning should be a conclusive proof of the superb type and individuality of our herd.

REGISTER OF MERIT WORK

Every cow in our herd either has a creditable Register of Merit Record. a record not yet reported or is now on test. The following is a partial list of Register of Merit records we have made in our herd. **Eminent's Desirable (213887)** at 15 yrs. made 425 lbs. butter, 8,350 lbs. milk in 248 days; **Volunteer's Nellie (233554)**, 447 lbs. butter, 7,394 lbs. milk one year; **Volunteer's Sally**, 597 lbs. butter, 9,540 lbs. milk; **Volunteer's Lotty**, 433 lbs. butter, 7,911 lbs. milk; **Sally of Oak Grove**, at 2 yrs., 2 mo., 594 lbs. butter, 9,660 lbs. milk, state record when made; **May of Oak Grove**, 2 yrs., 6 mo., 628 lbs. butter, 10,089 lbs. milk; **The King's Son's Girlie**, 2 yrs., 9 mo., 392 lbs. butter, 6,268 lbs. milk; **Coffey of Oak Grove**, 2 yr., 3 mo., 447 lbs. buter, 7,207 lbs. milk; **Commander's Sally**, 2 yrs., 4 mo., 393 lbs. butter, 7,349 lbs. milk, 264 days, and **Fancy Lock**, 1 yr., 11 mos., 346 lbs. butter, 5,098 lbs. milk.

The best daughter of the great Oxford Majesty. Recently purchased at W. R. Spann's sale, for $700.00.

Trial's Noble of Oaklands (129365), our present herd sire and a prize-winning son of Noble of Oaklands.

Eminent's Safety Belle 2d (390457), first prize yearling heifer, Wisconsin State Fair, and seven county fairs.

BREEDING OF OUR HERD

According to a number of the best judges of the breed, we purchased recently at W. R. Spann's fifteenth semi-annual sale, the best daughter of the great **Oxford Majesty. Oxford Majesty's Jonquil (306608 Imp.)** is a grand individual, has a R. M. record of 529 lbs. butter, 8,253 lbs. milk, and is safely in calf to **Mabel's Raleigh Prince**, due to freshen January 30th. We intend to give this cow an opportunity to increase her present record. Most of our cows are of the **Noble of Oaklands and Eminent** breeding. Our present herd sire is Trial's Noble of Oakland, sired by **Noble of Oaklands**, that sold for $15,000.00, and is a consistent winner in the show ring. For twelve years we have given the subject of breeding Jerseys careful study and the quality of our young stock makes us feel as though our efforts have been rewarded.

ANIMALS FOR SALE

At present we are offering our **junior bull calf** for sale that was first prize at seven county fairs and the **Wisconsin State Fair**. He is out of a dam that has 594 lbs. butter in a year. Also a yearling bull that was a consistent prize winner and from a dam having 658 lbs. butter to her credit. In addition to these two bulls we have several others out of high record Register of Merit dams, as well as a limited number of heifers sired by a prize-winning son of Noble of Oaklands, that we will price. These youngsters are worthy of careful inspection. Let us send you a price list. Our farm si 2½ miles east of Eagle and 30 miles west of Milwaukee.

A. W. ARNOLD'S SHORT-HORN SALE

AT EAST SIDE FARM

GALESVILLE, WISCONSIN, THURSDAY, DECEMBER 20

30 COWS, 15 WITH CALVES AT FOOT; 5 TWO-YEAR-OLD HEIFERS IN CALF; 10 OPEN YEARLINGS; 15 SERVICEABLE BULLS

EVERY ANIMAL TUBERCULIN TESTED

For this, my first Short-horn sale, I will offer you a good, useful, clean lot of cows, heifers and bulls. This offering will not be fitted for sale, but are in working condition, much to your benefit. **15 cows sell with calves at foot** by Village Coronet by Village Omega out of a straight Augusta dam. This bull sells in the sale. Will sell five choice two-year-old heifers, all safe in calf. Also 10 yearling heifers, open.

BULLS—Besides Village Coronet, Dale's Victory is listed, he by Dale's Clarion by Double Dale, out of a Victoria cow. He is a senior calf and was shown the past season. Also Dale's Star, a full brother to Dale's Victory, a year older, first wherever shown this year as senior yearling. These three bulls are good enough to do service in any registered herd of Short-horns. You can afford to travel many miles to buy bulls of this caliber. The balance of the bull offering consists of good topped bulls, the type that the good farmer wants.

LOCATION—Galesville is on the Wisconsin side of the Mississippi river between La Crosse and Winona, Minnesota. No matter where you live, if you get to La Crosse or Winona you can get to this sale. Good train service so that you can get away the evening of the sale.

Tuberculin Tested

Every male and female in this sale has been tested and a clean bill of sale goes with every animal. All bulls and females guaranteed breeders.

I WANT YOU AT THE SALE
A CATALOG FOR THE ASKING

You can't afford to miss this sale if you want a few Short-horns that will make money for you. Good heifers, cows and calves and in calf again. Serviceable bulls.

G. D. GILBERT Lake Geneva, Wis.

JERSEY BULL FOR SALE
DROPPED NOV. 22, 1915. His dam is in Register of Merit, class AA, 701.8 lbs. butter as a junior four year old. Her dam made 447 lbs. butter when 13 years old. His sire is a grandson of Boutillier, the highest record cow on the island. Three of his daughters have already qualified for R. O. M. One of them, three-fourths of the same blood as the bull I am offering for sale, has made in 9 months 487 lbs. butter, age 2 years, 1 month, and will make over 600 lbs. at the rate she is going. Write for price and particulars.
P. G. WARMINGTON Honey Creek, Wis.

GERSTDALE JONES ($6,600)

Have four good spring boars for sale by Gerstdale Jones—litter mates to one I am going to use. Buy one of these boars and get in the "front row." Let me quote prices.
Wisconsin's Greatest Poland Herd. :: :: Bred Sow Sale February 6th.

O. C. OLSON, STRUM, WIS.

IF YOU WANT TO BUY ANYTHING in big-type POLAND CHINAS write me. Have a large herd and can supply you with boars or gilts or matured sows. The pigs are sired by BIG TYPE JIM; a son of Jim Crow, and many of them are out of MAC'S CHIEF dams, the boar that was twice grand champion at Milwaukee.

Big-Type POLANDS

I RAISED 27 BOARS by eight different herd sires, and have a few choice ones left. Several by CHIEF PRICE 256331, who sired the first prize boar pig at Minnesota and the largest pig at Omaha. Some by Mc'S BIG BONE 257809, and such noted boars as ORANGE WONDER, BIG BEN JR., BLUE VALLEY KING, JUMBO WONDER and SUNRISE PRICE, out of sows that were sale toppers and state fair winners. Act quick if you want a boar. No gilts for sale until after January 1st. They will be in pig to my $500 OAKWOOD BIG MODEL, first prize senior yearling at Minnesota, Wisconsin and LaCrosse. Weighed 870 pounds in August. Correspondence invited.
W. W. QUACKENBUSH (Jackson Co.) Melrose, Wis.

P. N. COLLINS RIVER FALLS WISCONSIN

MY EARLY POLAND boars and gilts are all sold. Have a nice lot of August pigs, that will go cheap, by CHIEF PRICE and SMOOTH JUMBO. Yearling rams sold, some good Oxford lambs. A nice Short-horn bull calf from a heavy-milking dam. Write and tell me what you want—we can do business.

30 YEARS BREEDING POLANDS

THIS FACT ALONE should prove that I have bred and sold POLANDS that have given satisfaction. Have choice BOARS and GILTS to ship this year at prices that you cannot turn down. Send your order

POLANDS

Winchester Model 94

Why Sportsmen choose the "94"

Strong, smooth action, few working parts of the Model 94

The Winchester Model 94 repeating rifle is chosen by more sportsmen than any other because of its wide variety of uses.

The Model 94, as nearly as any rifle on the market, is an all-'round rifle.

Deer hunters choose it because it is a sure game-getter within the range that most shots at deer come.

Campers and canoe hunters take it because it is accurate even for birds, makes very little noise, and will stand all sorts of rough handling.

New shooters prefer it because of its lightness and very slight recoil.

Farmers demand it because they can get it in the exact caliber they need, at a low price, and can buy the ammunition for it anywhere that firearms are sold.

Because of this wide adaptability the Winchester Model 94 is the gun for the one-gun hunter; but for the same reason it is also a great favorite with sportsmen who own many guns.

The Winchester Model 94 is furnished in a great variety of styles, in five different popular calibers, (.25-35 and .30 Winchester, .32 Winchester Special, .32-40 and .38-55 cartridges), and in an extra light-weight model (weight about 7½ lbs.). For the high power cartridges this rifle is fitted with a nickel steel barrel.

The barrel *is* the gun

Men who know guns realize that the accuracy and durability of a rifle lie in the barrel. On the quality of the barrel depends the quality of the gun. There is absolutely no difference in the standard of quality of the barrels on the highest and lowest priced Winchester guns. With Winchester the barrel *is* the gun and the single standard of quality has been attained only by the most unremitting attention to the boring, finishing and testing of the barrel.

The Winchester barrel

The barrel of the Winchester Model 94 has been bored to micrometer measurements for the cartridge it is meant to shoot. In rifling the barrel, the exact twist that is necessary to produce the best results with a given cartridge has been mathematically calculated and is verified by exhaustive practical tests before leaving the factory.

A bullet fired from a Winchester barrel spins point on with unerring accuracy to the limit of its range. The Bennett Process, used exclusively by Winchester, gives the Winchester barrel a distinctive blue finish that, with proper care, will last a lifetime.

What (P/W) means

This mark on the barrel means *Viewed and Proved Winchester.* This stamp stands for Winchester's guarantee of quality, with 50 years of the best gun-making reputation behind it.

Every rifle that bears the name "Winchester" and that is marked with the Winchester Viewed and Proved stamp has been fired many times for accuracy and smooth action, and with excess loads for strength. At every stage of Winchester manufacture, machine production is supplemented by human craftsmanship. It is a *test and adjustment process.*

It is this thoughtful care in manufacturing that has produced in the Model 94 a rifle of unsurpassed game-getting qualities and that has made it the favorite with hunters the world over.

Write for details of Winchester rifles, shotguns and ammunition

The Winchester catalog is an encyclopedia on rifles, shotguns and ammunition. Every hunter should have one. It gives detailed specifications of the Model 94 and describes at length the principles on which every one of the world famous Winchester rifles and shotguns is built. Write today. We will mail you a copy free, postpaid.

WINCHESTER REPEATING ARMS CO.
Dept. WX-S New Haven, Conn.

MODEL 95—Lever Action Repeating Rifle, solid frame or take-down. The first box magazine lever action gun ever put on the market and still the standard of its type. Shoots heavy cartridges and delivers a bullet with tremendous force at long range. Calibers .30 Army, .30 Government models 1903 and 1906, .303 British and .35 and .405 Winchester.

MODEL 92—Lever Action Repeating Rifle, solid frame or take-down, 24-inch barrel. Made for .44, .38, .32 and .25/20 Winchester cartridges.

MODEL 10—Hammerless Take-down Self-loading rifle. Shoots only its own Winchester .401 caliber cartridge. No rifle made equals the Model 10 for delivering five as powerful blows in as few seconds.

MODEL 07—This is the world-famous .351 Hammerless, Take-down Self-loader, shooting only its own .351 caliber Winchester cartridge.

VOL. XLVI. NO. 50. THURSDAY, DECEMBER 13, 1917. WHOLE NO. 1872

International A Food Training Camp

The Drafters in Harness Proved to Be One of the Attractive Features of the International.

DESIGNATED by the Department of Agriculture as a special food production and conservation agency—a food training camp—the International Live Stock Exposition, Chicago, which closed its gates December 8th, made a record that in many respects surpassed former achievements. While the 1917 state fair circuit was fairly successful, it is nevertheless true that live stock entries showed a marked falling off in a number of instances. This falling off by no means indicated a lessened interest in pure-bred live stock production. Indeed, on the contrary, there never has been a more lively concern shown regarding the great value of pure-bred animals as a basis of the meat industry as has existed during the greater part of the present year. Possibly the real explanation of the decrease in the number of state fair entries was the high price of feed, many breeders preferring to conserve their grain and roughage rather than to use it in fitting animals for the show ring. On the other hand, the International, which is the great closing event of the show circuit, had the largest entry list of its entire history. Not only was the list large, but it was a well-balanced one, there being a superb showing of horses, cattle, sheep and swine.

One of the unique features of the International this year was under the supervision of the Domestic Science Department of the Iowa Agricultural College. A staff of experts was engaged during the entire week in a most important kind of instructional work designed especially to show ways and means of conserving those food products that are especially needed by our allies. Much was accomplished during the week to arouse visitors to the necessity of using what might be called perishable foods, thereby conserving those that are transported with the least loss. The four things that must be saved are wheat, meats, fat and sugar, and the International Live Stock Exposition last week did an important part in getting into the minds of those interested in these matters practical methods so that each one shall become in the future a food conserver. The instructors in charge of this department made a special plea for breaking down sectional lines that have existed in the past in the matter of cookery, and this school of instruction accomplished much by way of bringing together the best recipes obtained in the north, in the south, in the east and in the west. The visitor who was privileged to hear the lectures and see the practical demonstrations was convinced that food might be conserved without the daily diet becoming monotonous, and to this end much valuable literature was distributed. The keen interest shown in this kind of work was a most satisfying omen as to the attitude of our people toward the whole problem of conservation. Special emphasis was placed on the request of Mr. Hoover that we reduce our present consumption of wheat at least 25 per cent, using in its place other products, of which corn meal must be an important factor. The management of the International is to be congratulated because of the success that attended this feature of the exposition last week.

The Grand Champion Steer, Merry Monarch,
A 1,600-pound Pure-bred Short-horn shown by Purdue University.

The Experiment Stations have always taken an important part in exhibiting live stock, particularly in the fat classes, but Superintendent Heide has been working diligently to extend the educational influences of these institutions. This year a considerable number of the stations installed educational exhibits that attracted a large number of visitors. The exhibit of the Iowa Station was designed to show the practicability of eliminating tuberculosis from the breeding herd by a system of quarantine that made it possible to retain valuable breeding animals even when they were diseased. By taking the calves away from their dams at birth it was found that very few proved to be reactors, and in this way good breeding animals were utilized year after year even though they are diseased sufficiently to react to the tuberculin test. The Iowa Station also made a special exhibit designed to show that self-fed hogs will make more rapid gains and more economical gains than can be made by hand-feeding, thus eliminating an important labor item. The Nebraska Station, by a series of charts, brought vividly to the minds of visitors the nature of rations designed to give the best results in feeding steers. It was shown that the use of a small proportion of cottonseed meal in conjunction with corn will make more rapid gains and more economical gains than a straight corn ration. Exceedingly instructive charts were also exhibited by the Ohio, Pennsylvania and Texas Stations, and the International is to be commended for the foresight displayed in obtaining these exhibits. Many

(Continued on page 8.)

CURRENT EVENTS

PRESIDENT WILSON delivered his message to congress, on its convening for the long winter session, last week; the major part of the message being devoted to war problems and to the necessity of the United States declaring war upon Austria, as it did upon Germany last April. The president asserted that it was not necessary to include Bulgarian and Turkey (other allies of Germany) in the war declaration as yet, that this can be left to a future date, but that a declaration of war with Austria is absolutely necessary now. The president also asserted that this is no time for premature peace talk, but that the war must be fought through until Germany is made a real democracy and will never dare again to assail the liberty of the world. The peace which the president will be willing to accept will accomplish the following things: "It must deliver the once fair lands and happy peoples of Belgium and northern France from the Prussian conquest and the Prussian menace, but it must also deliver the peoples of Austria-Hungary, the peoples of the Balkans, and the peoples of Turkey, alike in Europe and in Asia, from the imprudent and alien domination of the Prussian military and commercial autocracy." In many respects the president's last message is the strongest of any he ever sent to congress and will undoubtedly rank among the great state papers of the nation. The president concluded with these ringing words: "The purposes of the central powers strike straight at the very heart of everything we believe in; their methods of warfare outrage every principle of humanity and of knightly honor; their intrigue has corrupted the very thought and spirit of many of our people; their sinister and secret diplomacy has sought to take our very territory away from us and disrupt the union of the states. Our safety would be at an end, our honor forever sullied and brought into contempt were we to permit their triumph. They are striking at the very existence of democracy and liberty. It is because it is for us a war of high, disinterested purposes, in which all the free peoples of the world are banded together for the vindication of right, a war for the preservation of our nation and of all that it has held dear of principle and of purpose, that we feel ourselves doubly constrained to propose for its outcome only that which is righteous and of irreproachable intention, for our foes as well as for our friends. The cause being just and holy, the settlement must be of like motive and quality. For this we can fight, but for nothing less noble or less worthy of our traditions. For this cause we entered the war and for this cause will we battle until the last gun is fired."

CONGRESS lost no time in acting upon President Wilson's suggestion for a declaration of war against Austria. The very day after it listened to the president's message, resolutions declaring war were introduced in both houses, the resolution reading in this manner: "Whereas the imperial and royal Austro-Hungarian government has severed diplomatic relations with the government of the United States of America and has committed acts of war against the government and the people of the United States of America, among which are its adherence to the policy of ruthless submarine warfare adopted by its ally, the imperial German government with which the United States of America is at war, and by giving to its ally active support and aid on both land and sea in the prosecution of war against the government and the people of the United States of America, therefore, be it resolved, by the senate and house of representatives of the United States of America in congress assembled, that a state of war be and is hereby declared to exist, and to have existed since noon of the fifth day of December, 1917, between the United States of America and the imperial and royal Austro-Hungarian government; and that the president be, and he is hereby, authorized and directed to employ the entire naval and military forces of the United States and the resources of the government to carry on war against the imperial and royal Austro-Hungarian government, and to bring the conflict to a successful termination all the resources of the country are hereby pledged by the congress of the United States." It is confidently expected that congress will pass this, or a similar resolution, with but few opposing votes, probably before these words are read. There is a general disposition in congress to back up the president in his war policy. American troops can hardly be rushed to the aid of the Italians, hard pressed by the Austrians, until such a war declaration is passed; hence the haste with which the powers at Washington are working.

DECLARATION of war on Austria-Hungary automatically will make enemy aliens of 1,174,973 Austrians and 495,609 Hungarians in the United States, according to the last census. The number is doubtless much greater now. Scores of them will be arrested within a few hours after a declaration of war. Many of these men have been under surveillance by department of justice agents for months, but have not been taken into custody because of lack of definite evidence against them. A serious shortage in mine labor is feared as one of the eventualities of the declaration of war on Austria-Hungary. The number of Austro-Hungarians employed in the mines of the country will run into the tens of thousands. There are other thousands of Austro-Hungarians employed in munitions plants. Under the president's proclamation they would be discharged immediately from such employment. The president pointed out in his message to congress that Austria has become merely a vassal of Germany and is no longer an independent nation; hence the necessity of including it with Germany in the declaration of war. Had it not been for the success of the recent drive against the Italians, Austria might by this time be in a position to consider peace, or even to ask for it, but now that Germany has bolstered up the Austrian forces, Austria will probably be content to let the war proceed until it meets with heavier reverses than it has yet suffered.

NOTWITHSTANDING the most severe fighting, at an immense cost in human lives, the Germans have been unable to break through the line which the English troops recently drove through their lines in northern France. Last week saw some of the most desperate and deadly fighting of the entire war, but at its conclusion the British forces were intact, though the Germans lay dead in rows. The English have been unable to take the town of Cambrai, which they had surrounded and which is an important railroad junction, but they were not obliged to retire to any considerable distance and were holding their ground well. It is expected that another English drive will be made in the near future, the English policy apparently being to keep up the fighting all winter, regardless of weather conditions. It has been announced that American engineers were quite a factor in the recent great English advance and that they bore themselves extremely well.

A WAR budget of more than eleven billion dollars to pay army and navy costs during the fiscal year 1919 faced congress when the government's estimates were presented. The sum represents only the strictly military expenses that can be estimated so far in advance and is more than two and a half billion larger than similar appropriations made for the years 1917-1918. So far as the estimates show it provides only for raising and maintaining an army of 1,500,000 men and carrying out naval and coast fortification increase projects already authorized. The chief item in the budget is for the military establishment of the army, to cost $6,615,936,553, an increase of $1,365,907,609 over the total of army appropriations made at the last session. The only means of determining the size of the army provided for is in the estimates of $1,003,933,676 for pay. This is $159,294,558 greater than appropriations obtained last session for the pay of 62,000 officers and 1,208,300 enlisted men of the line and 398,000 enlisted men of the various auxiliary corps.

AN interallied war conference was held in Paris last week, participated in by the United States, France, England and the other leading nations engaged in the war against Germany. Probably the greatest result of the conference was the decision to create an international organization to coördinate the utilization of transport facilities. In this way, without hampering the employment of the various nations' resources, it is planned for them to restrict their imports to permit as much tonnage as possible to be released for the carrying of American troops. The conference provided for an interallied committee to carry out the decisions of the body with regard to unity of action in the production of war manufactures, such as armaments and airplanes, by way of avoiding duplications and for specialization by the the various nations in the branches of production for which they are best fitted. This means that all the countries fighting Germany and Austria will provide transports for the conveyance of American troops to France and not make the United States depend entirely upon its own shipping facilities; also that the whole business of war will be put upon a systematic basis. The conference is deemed to be a long step toward the more efficient coöperation of the allies and ultimate victory.

THE collision, in Halifax harbor last week, of a French ship loaded with munitions and a Norwegian ship in the Belgian relief service caused the death of over 2,000 residents of Halifax and resulted in what has already been called "the worst disaster on the American continent." The Norwegian ship rammed the French munition ship and in seventeen minutes the entire cargo of munitions had exploded with such force that one-half of the town of Halifax was blown up or set on fire and the explosion was heard and felt sixty to seventy-five miles away. The relief work started at once, but it was an almost helpless task at first. Men, women and children were literally blown to pieces by the thousands. Canadian officers who have seen two and three years' service on the battlefields of Europe declare that they never saw such awful widespread destruction. Children were killed when their bodies were hurled against telephone poles and whole schools were done away with in a twinkling. An investigation will be made, but at first reports the catastrophe seemed to be only an accident, with no German plotting visible. Relief is being rushed from other towns in Nova Scotia, from the United States and from all parts of the world.

IN ordering an investigation of complaints of alleged discrimination against negro men in the national army, Secretary Baker made it plain that he considers most of the complaints unwarranted and due to German propaganda. The inquiry is to determine whether the war department's instructions have been carried out that the negroes be not required to do an unfair share of the manual labor of the army. The complaints are held by the secretary to be unwarranted in view of the fact that more than 626 graduates of the negro officers' training camp have been commissioned in the medical corps and that a full fighting division—the Ninety-second national army division—of 30,000 negro troops is being organized "for duty in France under Gen. Pershing."

Somewhere in America

Laying submarine cable, hundreds of miles of it, to scores of isolated lighthouses is one of the telephone tasks made necessary by the war. The Bell System has also built lines connecting some two hundred coast guard stations.

It has built complete telephone systems for fifteen National Army cantonments and fifteen National Guard camps, each a city in size, and also at many naval, officer's reserve, mobilization and embarkation camps and at army and navy stations.

It has provided an enormous increase in long distance facilities throughout the country, that satisfactory service may be maintained between cantonments, training camps, guard outposts, military supply stations, war industries, the National Capital and other centers of Government activity.

The Government facilities at the National Capital have already been increased three-fold and there has been a tremendous increase in local and toll facilities.

Fifteen thousand miles of telephone wire have been taken from other use for the exclusive service of the Government and some 20,000 miles of telegraph facilities also provided.

Meanwhile the Bell System has given generously of its man power, until over seven thousand men are in service or recruited for military duty.

Members of the Bell System whether they have already gone to France or whether they have stayed at their posts to help mobilize the country for victory, are equally in the service of the Nation.

The Private Lighting Plant.

The introduction of electricity into the farm home has done much toward solving the back-to-the-farm or rather the stay-on-the-farm problem, in the opinion of Clarence E. Reid, professor of electrical engineering in the Kansas State Agricultural College.

Modern conveniences which electricity makes possible, combined with the good, clean living that cannot be duplicated in any town, tend to make the country compete successfully with the bright lights of the city streets for both the boy and the girl.

It is now generally recognized that electricity furnishes the cleanest, safest, most effective and mose convenient system of artificial lighting. It is especially valuable for use on the farm—in the house, stables, and barns where there is always danger of fire when oil, acetylene, or gas lamps are used. Many of the farm chores must necessarily be done in the early morning or late evening and as a safe, convenient, and time saving light the electric lamp far surpasses any other form of lighting.

A large percentage of fire losses in rural communities are due to the use of oil lamps and other dangerous illuminants. A fire once started in the country is certain to be more destructive than in town because of the lack of help and fire fighting facilities

Probably the most common motor driven device for the home is one of the many types of washing machines. The introduction of one of these into the home not only eliminates the greater part of the labor of washday but saves a great deal of the wear and tear on the clothes.

The sewing machine, the churn, and in fact all motor-driven devices for the home, use a surprisingly small amount of power—not more than that used by two or three incandescent lamps. The other useful and labor saving machines are the motor-driven separator and grindstone. When the monotonous tasks may be quickly and easily finished farm life becomes a real pleasure.

"However much the farmer has appreciated the desirability of having electric lights, he has lived too far from any source of power to be able to buy it at a reasonable cost," said Professor Reid. "The private lighting plant has for the most part been regarded as a luxury even for the wealthy city farmer."

FAMILY CIRCLE TALKS BY THE PUBLISHER

TRAINING CITY BOYS FOR FARM LABOR.

EVEN before the war began I printed frequent articles to show that farm labor is among the most skillful and technical of any; that farming requires not only a particular gift or aptitude, but also the closest study of changing conditions and an open-minded acceptance of new discoveries and inventions. Since the war began I have continued these articles every little while. My purpose in the last three years has been twofold: First, to continuously and consistently impress upon the farmer the necessity of using only the most efficient labor and of realizing the nobility and usefulness of his calling; second, to open the eyes of our public officials to the fact that trained labor can poorly be spared from the farm even for our armies and that its place cannot possibly be filled by unskilled labor from the towns and cities, no matter how willing that labor may be.

I have had far too much experience myself with untrained farm help ever to concede that a man, however strong, can be taken from the city and made into an efficient farm hand in a short time. Farming is a calling to which men are born rather than made. Even when they are made, the process is a long and tedious one. Farming requires a knowledge not only of agricultural fundamentals, but likewise of chemistry, physics, engineering, electricity and such a host of other things as precludes its being adopted and practiced in any haphazard manner. I have had hopes, every little while, of convincing certain of our public officials of the truth of this statement, but they seem impervious to conviction and continue the even tenor of their way, unhearing, unseeing and unheeding. I refer, in particular, to certain of our army exemption boards, concerning whose stand in regard to the exemption of farm labor I have already written at length.

Having such firm convictions, it is gratifying to me to find corroboration given so conclusively by a New York farmer, writing in a recent issue of the New York Sun. This eastern farmer sought the assistance of the great city editor in an attempt to secure the help necessary to bring his crops through to the harvest. He heard from all sorts and conditions of people—invalids in need of a country vacation; drunkards, whose wives believed they could be cured on a farm; "jokers, who wanted to get a rise out of a hayseed;" slackers, who hoped to avoid the draft; and so on and on. As to the result, let the New York farmer speak for himself. These are his exact words, as printed in the Sun:

> Out of twenty to whom was accorded an interview, seven showed up, two who knew nothing of farming, but were "willing to learn," one whose reference acknowledged his ability, but added that he would need watching and was "wanted" in his home town for thieving.
>
> From among the remaining applicants one was chosen for the farm; he was to come out with his wife and begin haying—a kind and decent couple nearing the half century mark. Clean, kind, intelligent, the man yet was a disappointment to himself and to us.
>
> Plunged into the midst of haying, he could not harness a team, could not manage a mowing machine, did not know how to pitch, load or mow away hay. Willing he was, and did all he could; but was swept off his feet by the hustle. Things did not "go;" there was no time and there was no one at leisure to impart proper instruction; also a man of that age does not take kindly to instruction—and that is natural enough.
>
> We parted good friends, and shorthanded and harassed we got in the hay alone—all a little too ripe, all a little too dry and many tons short of what there would have been if all had been cut, dried and hauled in season with the requisite number of hands.
>
> We sowed no grains, we did not dare to; so have to buy what we use. The result is we cannot run the number of cows normal to the farm, nor provide adequately for those we have. We shall get through the winter, but only "by the skin of our teeth"—an uncomfortable and an eminently unprofitable method.

Even in the face of such convincing testimony, the idea persists in the minds of some members of some of our exemption boards that labor can be supplied the farmer overnight, that the riffraff of the town pool halls can be herded out to the farms and production can thereby be continued undiminished. Nothing could be further from the truth.

It is a positive relief, in such a crisis and with so much ignorance prevalent, to find a sensible and feasible solution of the farm labor problem presented by the director of the extension department of one of our grain-belt agricultural colleges. I have the honor to be a member of the State Council of Defense in the state where this particular agricultural college is located. In the course of my duties on this council there came to me a letter from this college man, setting forth the details of a plan for recruiting city boy labor for farm work. I can do no better than to quote a few sentences from the letter, which I have before me as I write:

> The plan I have in mind is, briefly, to give instruction to the city boys who desire work on the farms, along the line of haltering, bridling, harnessing, hitching and driving one, two three and four-horse teams to farm implements. City boys get in bad with farmers in nine cases out of ten because they don't know how to handle a team. They unbuckle the hames at the tops and let the tongue down before unhooking the tugs and do other foolish things.
>
> It would be very easy to put a ten weeks' course of instruction in handling horses in all of our high schools in this state that have city boys and it would be comparatively easy to find some keen, intelligent, retired farmer or other person who would be willing to do the teaching.

Here is the most feasible plan I have yet seen presented for solving the farm labor problem of the future. I shall do what I can to induce the State Council of Defense, of which I am a member, to approve the plan and to put it into early active operation. Every day that we lose is a day wasted. There are thousands of eager city boys who would be willing and glad to come out to our farms next summer, but unless they have some preliminary training they are worse than useless. A ten weeks' course this winter will give them the fundamentals necessary, so that by next spring or summer they will be material which the farmer can shape into at least a passable farm hand for the emergency.

This much is certain: We must have skilled labor if our farm production is to continue, and skilled farm labor is not to be had by the mere waving of a magic wand, even when held in the hand of an ambitious or designing politician. Two duties present themselves to us: First, to allow the present labor to remain on the farm until it can be supplanted by labor equally efficient; second, to train new labor into efficiency without a moment's delay. Unless both of these things are done our production will suffer, our prosperity will diminish and our chances of victory on the field of battle will wane. Must we be forever blind to the truth, when so much is at stake?

WHERE HEROISM IS FOUND

LAST week I printed a letter from Mrs. George Smart, of North Prairie, Wis., in which she pointed out that the father of the soldier boy, who leaves his comfortable farm home for the uncertainties and dangers of army life, is entitled to fully as much sympathy as the mother. I find her letter supplemented, most interestingly, by one received about the same time from a farm father, who has given his four boys to fight for Uncle Sam and who now finds it necessary to leave the new home and return to the old, where he knows he can get along better until the boys come back from the war. This farm father (George W. Scott is his name) shows such a spirit as the embattled farmers at Lexington showed when they fired the shot that was heard around the world and gave the British redcoats their first touch of battle. He has given all four sons to the cause of freedom, but is ready to go himself should his country need him. I cannot say how proud I am of the opportunity to print such a splendid letter as this one from Mr. Scott:

> Dear Mr. Pierce: I note your very excellent articles regarding the war and the general condition of our country and I am sure proud of your able arguments. The war has taken all four of the boys, and of course we feel very lonesome at times, and proud, too. We are going to have to give up our new home and go back to the old home and wait patiently the return of the boys.
>
> The government is calling for production and how am I, or any other farmer, going to do this when they take away all of our help? Well, I am proud we had four good, red-blooded boys to give to the service of our country, and they did not wait for the draft, either. So my good wife and myself can go back over the hill and sing the songs we used to sing and do all in our power to win the fight. You can imagine the feeling of my good wife, but she never shed a tear or broke down, until they were all gone, and then she said: "Daddy, did you tell the boys never to give up? I hope you did." But you can read a world in her face.
>
> I myself have joined the special service reserve, and it may be I may yet join the boys. I am willing to do anything or go anywhere to win the fight, so here's hoping you may keep up the good fight, and let's all join hands and show a solid, united front. If my subscription should expire in the meantime keep the paper coming and if I am not at home, mother will send you your money. May God bless you and keep you long, long years in your grand, good work.

Do you catch the significance of these two letters, the one last week from Mrs. Smart, the one this week from Mr. Scott? Each gives praise for unselfish loyalty to the other; the woman to the man, the man to the woman. The truth is, father's heart and mother's heart beat equally strong for the red, white and blue these days. We are in the midst of the greatest war the world has ever known. Sorrow has already come to many a farm home, as a result of this war. It will stalk into many another farm home before it is ended. Yet father and mother sit in the twilight, hand in hand, singing the old songs which the youthful voices used to carry, dreaming of the boy who has quit the old home place and may, at that very moment, be lying face upward in No Man's Land, his life blood oozing away. And as the winter night settles down upon the farm home and the rafters creak and crackle in the snappy cold, a quavering voice is raised in prayer, or perhaps "My Country, 'Tis of Thee" is sung falteringly, but through to the very last line; then silence and darkness—and dreams of the days when war shall be over and The Boy shall come back.

Believe me, my friends, not all the heroism is on the field of battle these days. You can find it, too, in many and many a farm home, thousands of miles from the battle line.

WHEN THE R. F. D. CARRIER ENLISTS.

I AM quite interested in the word which comes to me from Washington, to the effect that whenever a rural free delivery carrier enters the army or navy, it will be permissible to appoint any member of his family to his post without reference to civil service rules. The ruling was made in the case of a grain-belt girl, Miss Edith Strand, of Princeton, Ill., who asked permission to continue carrying mail on a rural route in place of her brother, who had enlisted for service as an aviator. Permission was at first refused, but the president's wife is said to have interceded for the plucky grain-belt girl, with the result that the president made an order in her favor. Similar privileges will be extended in similar cases, which undoubtedly means that the way is now open for other women to take over R. F. D. routes when the male members of their family are drafted or voluntarily enlist in Uncle Sam's fighting forces.

In this connection, my attention has recently been called to the fact that Mrs. Hettie Rankin, of Bates City, Mo., lays claim to the honor of being the oldest woman R. F. D. carrier, in point of continuous service, among all the 264 women whom Uncle Sam employs to haul mail to his farmer patrons. Mrs. Rankin drives a rural mail route daily, out of Bates City, twenty-five miles in length. She serves eighty-four rural mail boxes and handles on an average 7,284 pieces of mail a month. She has been driving the route continuously since November 1, 1903.

In the fourteen years which Mrs. Rankin has been driving for Uncle Sam she has failed to make her daily trip but twice. Once was when the bridges were washed away by a storm and the other time was when the roads were blockaded with snow. It is estimated that she has traveled 103,200 miles. She uses a buggy and two horses, and until the last few years she fed and groomed the horses herself. "Mail carrying is hard work, much too hard for most women, especially in winter," says Mrs. Rankin. "I entered the service because I had loved ones dependent upon me and I wanted to make steady money and be sure of my job. I was as happy as a kid when I passed the examination and got regular work at $33 a month." Mrs. Rankin has proved so faithful and efficient that today she receives $100 a month and an annual vacation of fifteen days on full pay.

If any of my readers know of a case of longer or more efficient service than this, I would be delighted if they would write me. In the meantime, the honor belongs to Mrs. Rankin.

VICTORY DEPENDS ON FARMS.

EVER since the war began I have contended that the man who raises a full crop of foodstuffs is every bit as patriotic and as necessary as the man who bears arms against the enemy; that production must keep pace with destruction. For a time I was practically alone in this contention. But now, I rejoice to say, the tide of public opinion is turning. Men are beginning to realize that the farmer is as necessary, is as vital a factor in ultimate defeat or victory, as the soldier. All over the country—not alone here in the grain belt, where the centers of food production are located—this idea is being expressed over and over again,

(Concluded on page 25.)

THE WISCONSIN FARMER, Madison, Wisconsin

Expanding Wisconsin Dairy Cattle Market.

Wisconsin farmers with plenty of good breeding stock for sale are rejoicing with their southern friends over the emancipation of 65,520 square miles in nine states from the cattle tick quarantine regulations.

The first day of December was the red-letter day set by order of Secretary Houston for the release of this great territory from the clutch of the dreaded cattle tick, the parasite which made shipments of improved stock into the territory an impossibility, and which greatly hindered the free interchange of trade relations to the mutual benefit of both southern and northern farmers.

It further tended to check the South's usefulness to the national war commissary department, and meant an appalling annual waste of grain and geedstuffs given to sick cattle.

Wisconsin is interested in this change for the better because since March 1st there have been nearly 200 carloads of dairy cattle, grades and pure breds, sent out of the state to sections of the South and Southwest which were less well provided with foundation stock with which to maintain the nation's maximum production in dairy products. Milk, butter, cheese, condensed milk—all these vital army needs must be increased immeasureably as speedily as possible.

The release of this vast southern territory to more northern breeding stock with good dairy records behind them means much. The South has the feed to give the cows, which the North in many cases lacks.

Further, it has been observed by men connected with these notable transfers of breeding stock southward that the trade has been checked and many favorable openings closed simply because of cattle tick quarantine.

Commissioners of agriculture, county agents, secretaries of commercial clubs and leading bankers of Arkansas, Texas, Louisiana and Mississippi have written to the Wisconsin breeders to the effect that they would be anxious to coöperate in getting some northern stock imported into their regions were it not for the cattle tick menace.

The governor of Mississippi declared December 1st a special state holiday. He desired all to join in celebrating the release of twenty-eight counties in the state, and at his office in the capital he received congratulations from the United States Department of Agriculture and several adjoining state executives.

The order releases large areas in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma and Texas. That the campaign will wax stronger against the tick next year is promised as certain, and it is believed that by 1921 the tick will have been dipped out of existence in the South.

The Rock Island Railroad, which taps a considerable area in the southwestern states, is allied with the Wisconsin interests which desire to establish a secure breeding stock market in the newly opening dairy lands of the country.

Most of the outside buyers who have come to the Badger state since last spring in search of dairy breeding stock have generally been accompanied by county agents or state live stock specialists of some sort. Local licensed veterinarians did the tuberculosis testing and all details were taken care of without friction. To date not a single complaint has been received from buyers.

As a means of quickly shifting valuable animals from centers having a surplus to places of scarcity, and thus adding much to the food-producing capacity of the country the plan offers great possibilities. The emancipated tick area makes these possibilities still more permanent and reassuring.

Direct trade between outside buyer and Wisconsin breeder means a considerable saving of time and money; besides, it also tends to restore confidence and make sales more satisfactory. As most of the local deals have been consummated through county agricultural representatives the plan is placed on a broader, less personal foundation, and assures the buyer fair treatment.

However, the greatest effect for good which the interstate breeding stock trade will bring out is that Wisconsin live stock centers will gain new vigor, and places which have hitherto been listless in the matter will awake to their position. When outsiders come in after stock they tell plainly and unmistakably what they want. They want calves of a certain age and a certain breed. Unless Wisconsin dairy communities get together with better purpose and plan to handle this trade right, buyers are bound to look elsewhere for stock.

Organization for standardization of production, although pretty long words, make a phrase which sums up the thing to be desired, and the new freedom of the South's tick territory will help to bring it about.

Potato Silage for Wisconsin

Further tests in the making and feeding of potato silage will be undertaken by the United States Department of Agriculture in coöperation with the animal husbandry department of the college of agriculture, University of Wisconsin.

The experiments were introduced to Wisconsin people by Dr. L. A. Rounds, of the United States Department of Agriculture, in a special exhibit and demonstration at the State Potato Growers' convention held here this week.

Potato silage as feed for hogs is being advocated by Dr. Rounds and others, following careful trials. Tanks of relatively small dimensions will be used in the Wisconsin tests. No attempt will be made to put the potato silage into silos.

The object of the work is to seek a possible aid to the corn ration and also to utilize the cull potatoes as well as to work up those injured for commercial use by frost or bin damage.

Potato silage has been made in Germany, but there a special culture medium was used to start active fermentation in the chopped potatoes. Dr. Rounds has originated a plan whereby the potatoes after grinding are put at once into water-tight receptacles, such as barrels or tanks, along with about 2 per cent of corn meal sprinkled in among the material. A weighted covering then is put over the top of the "potato silo." The mixture is then tamped down and covered for several inches with cornstalks or leaves.

Fermentation starts at once, and if the weather is warm gas bubbles appear in twenty-four hours. Considerable pressure is developed, which requires additional weights on the cover. After a few days this movement subsides, but fermentation is not completed until the end of three weeks, depending on the temperature.

"By the use of the corn meal to provide a lactic acid fermentation in the potatoes the Americans have improved on the German plan," said Dr. Rounds in explanation. "The use of from 2 to 5 per cent of corn meal mixed with the crushed potatoes will insure a true acid fermentation which will convert potatoes into silage."

It is claimed that the work may be done upon any scale and that losses should be small where reasonable care is used. The resulting potato silage, according to some specialists, is acid in flavor, free from putrid odors and has the consistency and appearance of the original crushed potato.

The machine which Dr. Rounds used for his exhibition at the state potato show in Madison crushed the tubers by passing them through an apple grater which has been modified by substituting rows of blunt spikes in place of the grater knives.

The Live Stock Situation.

In the annual report of the secretary of agriculture, David F. Houston, which has recently come from the press, special attention is called to the fact that our population has increased about 13,000,000 in the last ten years, whereas there has been an actual decrease in the live stock for the same period. In some respects, however, according to the secretary, the situation is encouraging because there has been an increase in the number of milk cows in the last four or five years. At the present time there are 23,906,000 milk cows as against 22,768,000 a year ago and 20,497,000 in 1913 before the European war began. Four years ago there were 51,482,000 sheep in the United States, but in 1917 this was reduced to 46,059,000. Hogs have decreased in numbers more than 4,000,000 head, although hog production is greater now than at the beginning of the European war.

The department proposes to expend a good deal of energy to the end that greater returns are forthcoming from hogs and poultry. These give the quickest returns and funds have been appropriated to employ a considerable number of specialists to give their entire time to the task of increasing the number of hogs. There will be thirty-nine specialists who will devote their energies to giving instruction in poultry raising, so that in this way the department hopes to greatly enhance meat production. Already field agents of the department have assisted in the transfer of 100,000 cattle from localities where there is a shortage of feed into those regions where feedstuffs are relatively abundant. This in itself is an important factor, considered from the standpoint of the welfare of the nation and the part this country shall play in the great conflict now under way.

In connection with the campaign to increase meat production the bureau of animal industry is prepared to deal with live stock diseases that are now causing heavy losses in a more effective manner than ever before. Forty-six workers have been added to the force now engaged in combating cattle ticks in the South and it is reported that 51 per cent of the original infested territory has now been cleared of the tick. It is reported that hog cholera losses have decreased 30 per cent during the last year and sixty-five additional veterinarians have been assigned to the work of controling this disease during the coming year. Some nineteen specialists have also been detailed to assist in combating tuberculosis of cattle and swine as well as abortion in cattle, while other specialists are engaged in the work of controlling blackleg of cattle and anthrax of domestic animals.

Shall Wisconsin Increase Hemp Acreage?

Unless hemp seed prices take a decided downward trend it is doubtful if Wisconsin farmers will invest very heavily in this great fiber crop another season. They will, at least, not extend the present acreage should high prices prevail for seed. The demand for food crops and live stock products will also tend to keep hemp enthusiasm from spreading.

Andrew H. Wright, of the Wisconsin station, who is helping to promote the state's hemp growing along safe and sane lines, made a plain statement this week from his headquarters at the college of agriculture. He declared that unless Wisconsin can feel sure that net returns from hemp will be large the growers cannot afford to develop new sections for the production of the crop. Present quotations from seed-producing centers warrant the assumption on the part of Wisconsin growers that the price level will be kept rather beyond the safety point.

Should Wisconsin be able to get seed at about $6 a bushel (forty-four pounds in a bushel of hemp) and lay it down in the state for $7, a fairly good acreage could be planted next spring, with the possibility of opening some new centers. Six dollars is said to be a liberal price for Kentucky seed growers to get, and one which is entirely fair considering production costs, interest rates and other items.

Kentucky growers may be laboring under a false impression as to the exact demands for hemp seed, Mr. Wright says. Instead of the demand being greater than the supply, the reverse is true.

The total amount of hemp seed available this year will be larger than usual. The amount raised in Kentucky will be practically the same as last year; several thousand bushels of old seed were held over; and over 5,000 bushels of seed were grown this year in Kansas and California.

It is estimated that there will be about 60,000 bushels of seed produced. Last year the total acreage in the United States was estimated at less than 43,000 acres.

The rate of seeding usually advocated is one bushel to the acre, so this means that there will be about 60,000 acres planted if all the seed is used. This would mean, however, an increase of about 17,000 acres in the principal hemp-raising states. Will there be as large an increase as this? This is the doubtful point at issue.

Wisconsin will do well to equal its 7,000-acre point made in 1917. Of these, 1,000 acres were sown at a contract price of a stated sum for each ton of cured stalks. It is not expected that this contract will be renewed again—at least, not for so large an area.

Under existing conditions Wisconsin will do well to get out an acreage of hemp large enough to protect the capital already invested in machinery and breaking plants. Demand for seed is also on the wane in California, where a smaller acreage is anticipated for next year. In the Dakotas and Minnesota and other northwestern states where over 8,000 acres were grown last year, the crop was unsuccessful, and it is doubtful if any seed will be used in that region next spring. The chief hemp increase will be in Ohio, Indiana and Michigan, where the crop is grown on muck land and there is plenty of machinery to care for the crop.

Whether or not Wisconsin can progress in hemp culture this year, then, depends on conditions beyond the control of its growers. The result will be awaited with interest.

The Farmer's Interest in the Village Library.

Are the librarians in the small towns of Wisconsin really alive to the rural population, or do they cater almost exclusively to town readers or country folks solely interested in literature, music or art?

How about farm journals and agricultural experiment station bulletins and reports? Would it be an easy matter to obtain a copy of such publications in the average small-town Wisconsin library?

After visiting a few such libraries and talking with farm folks in a number of places it seems evident that there is a strong case against the small-town library in this respect, namely, that it has failed to get the true perspective on economic conditions and has failed to fill a real demand for service on the part of country readers who help support it.

First, let it be understood that, although the farmer does not directly pay a tax to support the small-town library, yet as a constant trader and patron of the town in which it is located he is indirectly responsible for much of the wealth which is taxed to pay for the library. No one can deny that fact.

Therefore, why are not the needs of the farmer given more consideration in selecting lists of books and periodicals for small-town libraries and reference shelves?

Take the experience of a county agent in Kentucky, who told the writer that he had a group of boys nicely started on the preparation of programs and debates for winter club meetings,

but they lacked enthusiasm for the subject because of a dearth of ready reference books and magazines. The subjects were all of direct farm application, yet the town library contained nothing to aid them in outlining their papers and preparing arguments.

For instance, should a debater wish to seek the records of sales for a certain breed of stock, or data on feeding trials, milk production statistics or other proof with which to arm himself against attack by his rivals, where would he go?

Some might answer that the average farmer receives all sorts of publications and bulletins and doesn't need a library. This is true enough, but overlooks one important fact—the real reason why libraries were created and are maintained at public expense.

Libraries are kept to file, index, cross-index, catalog and otherwise tabulate facts for the benefits of those who need facts in a hurry and without lost motion. They are the time savers of a busy public—or should be. Hence if they do not keep accurate and careful index of farm publications and have farm journals of sectional value bound for constant reference what is their service? It amounts to little for the farmer and the farmer's family.

At home the bulletins and magazines become piled up hodge-podge and finally become lost at house-cleaning time, if not sooner. The library must keep the official files for the farmers of its bailiwick. It is not only a privilege, but a duty.

Does your own home town library keep bound volumes of farm papers, at least those applicable to this field? Does it afford ready reference and up-to-date help in farm problems? For the good of yourself and community we hope it does.

Cold Weather Tips for Tractor Owners.

A special kind of care should be given the tractor during the winter whether it is idle or in use, and to this end the Avery Manufacturing Company has recently sent out to the owners of Avery tractors some instructions involving the principal points to be kept in mind. Doubtless these will apply equally well to all tractors and we, therefore, quote from this circular:

As cold weather approaches one cannot be too careful about letting a motor freeze up. Hundreds of motors are frozen up every year by the first cold weather that comes, because the owners neglect to drain them out and think, "Oh well, it won't freeze hard enough tonight to do any harm." If a tractor must be run after freezing weather sets in, it must be drained every night immediately upon stopping the motor, or an anti-freezing solution used in the radiator.

In very cold weather we find that kerosene can be used very successfully as a cooling agent, also a solution of 33 1-3 per cent of denatured alcohol and water. If about 10 per cent of glycerine is used in this solution it will prevent the alcohol from evaporating so fast.

Also as cold weather comes on, it is generally necessary to use a lighter oil in your motor, as instructed in the instruction book; otherwise, the motor will get so stiff nights that it will be practically impossible to start in the morning.

It is also necessary to prime heavier and in some cases use a higher test gasoline for priming than in warm weather.

It is also necessary to keep the plugs perfectly clean for starting, as moisture is much more apt to form on the plug and short circuit it in cold weather than in warm weather.

If you are going to lay the tractor away for a while, you should, when stopping the tractor on its last run, pour in a pint or more of oil into each priming cup and then shut the motor down immediately afterward. This oil will be drawn into the cylinders and will coat the valves and valve stems with an oil film which will protect them from rust.

In putting a tractor away, it should be looked over very carefully to see that all parts of the cooling system are drained thoroughly. If the tractor sits high at one end or the other, water may lodge in certain places and if freezing does not damage it, it will rust the parts and in time cause trouble.

The user of a tractor will find it a paying proposition to house the tractor at all times when it is not in service. However, if it is not housed, there should be something placed over the stack of the radiator which will prevent snow and rain getting in, and a tarpaulin or canvas large enough to cover the motor complete used, as the motor should not stand out and take the weather.

The fuel tanks should be drained and protected so that it will be impossible for water to get into them. If the last time the tanks are filled with fuel a pint of cylinder oil to each five of fuel is put into the fuel tanks, it will leave an oil film on the inside of the tanks which will be very beneficial in prolonging the life of same.

Also in putting away a tractor the user should make a note of all parts that will be needed to put on the tractor when it is put into service again in the spring, for if you wait until time to use the tractor in the spring, you are not only liable to overlook some of these parts, but there may be a delay in getting them promptly.

In addition to these suggestions, attention is called to the fact that little oversights in caring for the tractor during the winter are often expensive in the end and cause long delays when it is necessary to put the tractor into use. Naturally, manufacturing companies are in a better position during the winter months than at any other time to attend to the needs of their customers and no man can afford to enter upon his spring work without having his tractor in tip-top condition. The life of the tractor depends not only upon the kind of care given to it when it is in operation, but also upon the attention to details that it receives when idle. In any event, considerable of an investment is involved and no man can afford to give his tractor anything but the best of care.

Save Calves From Beef Cows.

The hue and cry about the marketing of veal calves and a continuation of the practice because of its effect on the future meat supply is often entirely uncalled for. Certain types of calves from the dairy breeds can be dealt with at a profit only in one way, and that is to convert them into veal. If they are kept until they are two or three years old they will eat their heads off several times over and never make satisfactory beef. On the other hand, something should be done to stem the tide of marketing vealers of the beef breeds. Attention is called to this matter by an Illinois subscriber who writes:

There are several reasons why beef cattle are scarce, but one of the foremost is that farmers are selling so many of their veal calves at the age of six weeks or even younger, at times. They do not seem to consider how much loss is incurred by so doing. These calves can be placed on pasture and before the owner realizes it they are old and large enough to be put on dry feed and be fattened for market. This is one reason for the scarcity of feeding cattle, but most of the farmers who sell calves at such a tender age do it simple because they do not care to feed a steer for market.

As I am a frequent visitor at our local stock pens, where a large amount of stock is shipped weekly, I cannot but notice the number of small calves that are brought in daily by the farmers of this as well as other communities. One day last week, one man with whom I was well acquainted and who is a large stock breeder, brought in four calves, all of which were small, but were good Short-horn stock. I asked him why he was selling these calves of such good quality when he was prepared to feed and grow them. He replied that he wanted to get them out of the way so that he could sell his milk. This farmer could have easily raised these calves until they would have brought him upwards or perhaps better than $100, and a good part of that would have been profit.

There is the proposition, many farmers have never tried keeping their young stock and do not know the real value of it. A calf that is born, reared and fattened on the same farm is the one that pays best. Not only is it a better feeder, but it is a quiet and hearty animal. Not every farmer, of course, is prepared to feed cattle, but if he wishes he can be, without a great deal of expense. Not every farmer on the other hand, knows how to feed and fatten cattle, but this can be learned by beginning with a small number and gaining experience little by little. Ask other farmers and read of other feeder's experience and then apply their methods to your own herd.

It is poor economy to underfeed, however expensive feeding materials may be. If a herd of cattle are on the farm to be fattened the corncrib must not be nailed solid nor contents spared. When cattle are being finished a variety of feeds must be given and if it is not grown on the owners farm it must be bought, for it is a good investment to buy feed when cattle are high and like they are apt to stay.

We feed only what will be cleaned up between feeding times. Regularity is an important point. Good, fresh water is another real necessity. We allow the feeders to have free access to an open shed and a large straw stack that is in the feeding pen. I feed corn stover, clover hay, crushed corn, cottonseed meal, and balance with silage.

I find that cattle cannot be fed at so much profit unless hogs are allowed to follow them. Much corn is thrown from the feeding troughs by the indifferent steer, and this scattered grain, including the droppings, makes a fattening ration for a number of good-sized shoats.

Those who can get cattle and hogs to feed should not question the advisability of feeding the corn rather than selling it. The price for good beef is most likely to hold. I usually have a bunch to sell during February thus giving ample time to clean the pens of all manure before the spring crops demand attention.

Now that there is an actual shortage in the meat supply and the price is correspondingly high, every stockman should undertake to solve this problem for himself and save, wherever it is possible, the calves that have a cross or two of beef blood in them. Whether desirable or not, we are nevertheless going rapidly in the direction of producing specialized stock, whether along beef or dairy lines, but in spite of this an important place is occupied by the grade animal of mixed breeding. One Short-horn, Angus or Hereford cross even on a dairy animal effects a tremendous change in the progeny and all animals of such breeding should in these times not be marketed before they weigh 1,000 or 1,200 pounds.

THE WORST OF THEM ALL
The Firebrand Who Fights the Farmer and the Food Supply.

Splitting Potato Eyes.

Seed potatoes were high in price last spring and growers were using every possible means to obtain a crop by the use of as little seed as possible. In some instances potato parings were planted and in other cases men were so economical in the use of their seed as to split the eye. Men could be found who have no faith in the latter plan, but believe that this results in destroying the eye absolutely.

In order to test the matter out the experimental department of the Emerson-Brantingham Implement Company conducted an experiment during the present season by planting severed eyes. One eye was divided into two parts and each part planted in a hill by itself. Soil conditions were exceedingly unfavorable, but one of these half eyes produced three potatoes and the other four, or an average of three and one-half potatoes per hill. When an eye was cut into four parts and each part planted in a hill by itself two and three-fourths tubers per hill were produced. The matter was even carried further and one eye cut into six parts, the result being that each hill from these six parts produced an average of one and one-half tubers. There was but little variation in the size of the potatoes from the different cuttings, but it will be observed that the smaller the cutting the less the yield in the number of tubers. The two hills from the one eye produced seven potatoes, while the four hills from one eye produced eleven potatoes and on the other hand the six hills from the one eye produced nine normal potatoes in addition to two that were so small as to be unfit for use. In the latter case there was one blighted hill that produced nothing.

The conclusion to be drawn from this little experiment is simply this, that split potato eyes will grow. On the other hand, the reduction in the number of tubers per hill when the division becomes too fine would indicate that the practice of cutting the eyes is not on the whole a profitable one. The matter is of special interest to those who use the fork or cylinder type of potato planter, because it shows that eyes pierced or split by the planter forks which catch and drop the pieces into the furrow are not necessarily destroyed, but may perhaps grow almost as well as whole eyes. This is important in these times when so much is being said and done in favor of utilizing machine instead of hand power in every possible way.

Salting soft corn as it is being put into the crib has proved to be an effective measure against heating and rotting. After each load of corn goes into the crib, about a peck of common salt or ground rock salt is scattered over the top. The salt draws out the moisture, which then evaporates. The brine on the grain prevents molding before evaporation is completed. Farmers who have tried the method say the salt does not seem to injure the corn in any way.

BADGER FARMER'S MAIL BAG

FARM EXPERIENCES

Beds and Bedding for Swine.

To the Editor:—Hogs of all ages and sizes require comfortable sleeping quarters to realize for their owners full benefit for food consumed. This applies more especially to their accommodations from fall until spring. Stock of all kinds are more sensitive to cold wind and wet surroundings than many persons realize. Hogs, when on pasture, during cold nights will root a deep hole and bury themselves, or will pile one on top of another for warmth. This is unhealthy for them if practiced any length of time. All hog pastures should have portable sleeping pens. They are convenient and not expensive, and can be removed quickly with a pair of horses from one place to another. Fill these huts with corn stover, straw or leaves, nail a piece of heavy sacking or carpet across the top of the door, letting the sides and the bottom hang loose. This will keep out the wind and will not prevent the hogs going in or out. With this arrangement, and with the nests kept dry, hogs will be comfortable on pasture or in wood lots until real cold weather sets in. In very cold weather the most convenient and best place to winter pigs is in the barn. Provide for them dry sleeping quarters, free from wind currents; have all sleeping quarters well ventilated, however. A room that on a cold morning is filled with particles of frost adhering to the side walls and ceiling, caused by steam rising from the pigs, is not properly ventilated. It is unhealthy for man or beast to live in such an atmosphere.

Shredded cornstalks make good bedding, and the hogs will eat considerable of it. Oat and buckwheat straw are both bad for hogs to sleep in; they cause scurf, cracked skin and continued itching. Dry leaves make good bedding, but they lack lasting qualities; they break into small pieces and get damp quickly. Baled shavings and sawdust make nice bedding for warm weather; they absorb moisture and impart a pleasant odor, but are too cold and uncomfortable for winter use. I consider rye and wheat straw the best of all materials, given in quantities sufficient for them to burrow into during cold weather, and they will be dry and comfortable.

It is imperative that all beds, of whatever material they are made, be changed when they become damp, never waiting for them to get real wet and nasty, because dampness causes rheumatism and pneumonia.

Neither should the bedding get broken fine and dusty; then it is very injurious to the lungs. Prevention is better than a prescription for a cure.

All our sleeping rooms have wooden floors, but they accumulate more or less moisture and necessitate a change of bedding often. In order to economize on straw we build a portable bunk for each pen, made by placing on edge five strips of 2x4 scantling, four feet three inches long, and to these nailed four boards, one foot wide and nine feet long, leaving one inch space between the boards for drainage. Around the four sides of this floor are nailed boards one foot wide with a 2x4 eight-inch-long piece in each corner to strengthen them. This makes a strong, substantial bunk, eight inches deep, with bottom raised four inches above the floor, making the hogs dry and warm. These bunks can be made any size to accommodate the pen, etc. The size mentioned fits our rooms. Place the bunk in the corner of the pen and round it up full of straw and it will accommodate ten to fifteen shoats weighing upwards of a hundred pounds each. I have never used a more economical scheme for utilizing straw. By shaking it up, removing when wet and adding a little more straw when necessary, the beds will last a couple of weeks before getting broken and dusty; then clean out entirely and replenish. Pigs after eating will crawl into these ideal beds and will be comfortable and contented, and the contented pigs are the profitable ones for the farmer to grow.

When to Cut Tobacco.

To the Editor:—Forty-nine years ago I began growing tobacco. A few years later I decided that there were certain days better than others on which to cut tobacco for it to cure up nicely and have a rich, "waxy" and heavy body. To find out the way to tell these dates, and to tell them ahead, has been a hard job, but I was finally successful. To explain, let me say that tobacco has an oily substance which is its natural possession. It has a sap (water) like other vegetation. When the sap rises it runs the oil out through the pores of the leaves, on the principle that oil and water won't mix, and the oil, being the lighter, is pushed out by the sap. Tobacco cut in this state will be light and "chaffy." You see, there is nothing but sap in the tobacco and when cured this sap is gone. It evaporates and leaves the tobacco light and worthless, but to cut tobacco when the sap is down and the oil has full sway, you can cure it up nicely and with a heavy body; it will be rich and "waxy." This happens because the tobacco is full of oil, instead of sap, and the oil can't evaporate and remains in the tobacco to make it rich and heavy. It has been my experience that we must cut tobacco when there is oil in it if we expect to have oil in it when cured. For instance, you have experiences cutting one week and having excellent luck, and then cut a few days later, probably off the same piece of ground, and with riper tobacco and have no luck at all.

I shall be pleased to answer any correspondence from tobacco growers who may want to write me, provided postage is sent for reply.

Wisconsin Corn for Illinois.

To the Editor:—I was very much interested in the recent article in your paper by Mr. Chas. Hull, of Shawano county, Wisconsin. Now it happens that I was born and raised in the good old state of Wisconsin and when I want something extra good I send back to Wisconsin to get it. I saw Mr. Hull's corn at Madison last year at the corn show and it strikes me that it is what we need here in Illinois to be certain to mature a crop. If Mr. Hull has a quantity of seed corn, he evidently will have no trouble in disposing of it. F. W. Siperly.

Whiteside Co., Illinois.

[Editor's Note.—We are not at all surprised at the way our readers have grabbed at Mr. Hull's suggestion that he might have some seed corn to dispose of. Seed corn is scarce not only in Wisconsin, but also in sections farther south and we have had so much soft corn in the last few years that there is likely to be a slight tendency toward getting northern-grown seed if it is obtainable.]

Good Seed is Essential.

To the Editor:—I will say that I do not consider myself an expert in raising barley as yet, but will be glad to say something to the "Mail Bag" readers regarding my experience. The most important things are, first, good soil; second, good seed and, third, good, dry seed bed. I generally plow clover sod for corn in the fall and spread fertilizer on over winter and plant with corn in the spring. And then in the fall I plow up the corn ground early and again in the spring when the soil is nice and dry, I work it with a spring-tooth harrow and then I sow it with a drill, using about one and one-half bushels to the acre. This barley is drilled in about one inch deep in heavy clay soil. Then I drag the ground very thoroughly. It must be remembered this is Pedigreed No. 6 barley and the best seed I can find. I usually pick some of the largest heads so I have about one-half bushel of the very best seed. A very important thing is getting good seed. It is not possible to raise first-class grain from anything else but good seed.

Peter Dengel.

La Crosse Co., Wisconsin.

Crop Rotation With Oats.

To the Editor:—I have seen quite a few letters in The Wisconsin Farmer Mail Bag department in regard to raising corn, wheat, oats and barley. Will say that I have had some experience in raising a better grade of oats and have been quite successful inasmuch as my oats have been awarded first prize in their class for two years at the grain show held at Madison. This show is under the auspices of the Wisconsin Experiment Association. In addition to this I scored sweepstakes prize last year over all oats at the show. Of course, these things please me very much and it is a great gratification to a man to be successful after he has tried hard. For the benefit of the readers of The Wisconsin Farmer I will briefly outline what I consider the most important factors in getting a large yield of a good quality oats.

My soil is a gravel and sandy loam. I have the Swedish Select, also known as Wisconsin No. 5 oats. This latter oat has a very large, plump kernel well adapted to the medium and light soil, grows a large straw, not so well adapted to the real heavy clay or loam soil on account of the straw getting too large and has a tendency to lodge. To raise a good crop of any kind we should not forget that unless we keep our soil in a fertile state we should not expect a large yield even with favorable weather conditions.

This can be accomplished even on light soil by keeping all the live stock that can be pastured and fed during the winter months and by proper rotations of crops with clover. I use a three-year rotation. Clover first crop cut for hay, second crop may be pastured or turned under and followed next year with potatoes, third year, oats and seeded to clover. If potatoes are not raised, corn or some other cultivated crop should be substituted. The year the cultivated crop is raised the ground should be well prepared before planting and thoroughly worked as late in the summer as the crop would permit in order to kill quack grass and other noxious weeds. This is not only important for the cultivated crop, but it will be of immense benefit to the oat crop the following year.

Plowing should be done in the fall, during winter or early spring. I apply about five to six loads of barnyard manure per acre. Oats should be seeded early in the spring soon as the frost is out of the ground and it is in shape to work.

The ground should be thoroughly disked before seeding. The seeding is done with a single disk drill six inches apart with grass seed attachment. I seed about three bushels of oats per acre. The oats should be well cleaned and graded and only the best seed should be used.

I also treat my seed with a formaldehyde solution to prevent smut. After the seeding is done the land is rolled. Under favorable weather conditions a yield of from fifty to seventy-five bushels per acre should be realized. Chris Michelson.

Oneida Co., Wisconsin.

Varieties of Alfalfa.

To the Editor:—We sowed two different varieties of alfalfa last spring, one being Cossack Baltic and the other Grimm, and so far as I can see there is not any difference. However, I have one and one-fourth acres of the ordinary alfalfa, which I cut three times this year and which yielded five tons for the three cuttings. The last cutting was on the third day of September and as I write this on November 30th, the alfalfa is two and one-half inches tall, nice, thick and green.

Henry Ruhnke.

Kewaunee Co., Wisconsin.

Two Handy Farm Devices.

To the Editor:—Though only a hired man, I read your paper and find it very interesting and get lots of valuable hints out of it that the boss and I can talk over and try. Have not even a common school education and all I do know has been gained through reading papers and I believe that if a person has anything of value to save time and labor, he should pass it on, especially in these times of need. Now I have two things that we have tried and found to save labor and time, and I will try and explain them to you, and if you think they are worth publishing, do. If not, no harm done anyway.

The first is in regard to hanging seed corn. We take a piece of binder twine about twelve feet long, tie a loop in one end, hang loop on a nail overhead. Start and lay one ear in the bight about four feet from the loop and then half stitch with the loose end, and then keep laying ears on top of each other and keep on half stitching each one. Your ears will all lay parallel to each other, and can then be hung in a very small space. After curing, pull out your ears, cut off loop and pull out your twine when you can roll up and put away for next year.

My second idea is in regard to returning hayfork in barn. We tie a small rope to carrier, then run rope through small pulley on opposite side of barn floor from mow. Then run rope through pulley attached to sufficient weight and then up again and tied to rafter. We have the weight in a slide. Of course, the horses have to pull up the weight, after load is on track. After load has got to desired place unhook from evener and fork and carrier will return to stop block. It is helping us and if we could get anybody else to get any benefit from it, they are welcome. If anyone is interested and don't understand it fully, write. Our outfit cost 75 cents outside our own labor.

Chas. H. Yandry.

Jefferson Co., Wisconsin.

Why More Sheep in Wisconsin.

To the Editor:—To the question, "Why Wisconsin farmers should have sheep?" my answer is as follows: It would be a patriotic move for our country. It would help to clothe our soldiers and also feed them. Also the farmer will make more clear profit on a small flock than any other animal on the farm without exception. It takes very little to winter a sheep. Wild hay or clover will do it and they pick good living until the pastures are well covered with snow and in spring will find good living two weeks earlier than any other animal in pasture. A flock of Cotswold sheep will average between twelve to fifteen pounds of wool in spring, which will more than pay for the trouble of feeding and also feed and hay. Now your crop of lambs is about all clear profit. I mention a small flock because I know if a farmer only tries it he will soon increase it to a larger one when he sees for himself the easy money come in his pocketbook and also be patriotic to his country in time of war. As I said before, the soldiers are in great need of our wool and mutton, so let us help to win the war and also swell our pocketbook. G. Marco.

La Crosse Co., Wisconsin.

WISCONSIN FARMERS' CLUBS

Federation of Clubs in Rock County.

To the Editor:—On Friday, November 30th, a meeting for the purpose of federating all the farmers' clubs of Rock county into a county organization was held at Fulton.

All the farmers' clubs of Rock county were invited to meet with the Fulton Social Center and perfect the county organization. A meeting was held in the hall at 2 o'clock at which time Prof. C. J. Galpin, of Madison, spoke on the subject, "The Farmers' Clubs of Wisconsin." Following this was a speech by Assistant Dean Otis, of the agricultural college at Madison, on "The Purpose and Results of Cooperation." Our county agent, L. A. Markham, then gave the purpose of the meeting. We already have a county organization called the "Rock County Farmers' Improvement Association." This association now includes the Farm Management Society and the Stock Breeders' Society. These societies have been doing a good deal along their lines, but there are many other interests in the county that need developing and it was thought a wise plan to gather together into the present county organization all the organized societies, working under different names, but all working along the same kind of lines of community uplift, so the twelve farmers' clubs of Rock county were called together to consider the advisability of thus federating themselves together for united efforts in all practical farm and rural matters and especially a united effort to increase farm production in Rock county for war needs. Owing to the unpleasant weather and bad roads delegates from only four societies besides our own were present. Practically all twelve clubs sent word of their willingness to join the movement. A committee was appointed at the afternoon meeting to draft a set of resolutions and make suggestions towards this end and report at the evening meeting.

Supper was served at the hall from 5:30 to 7:30. Somewhere about 125 people were served.

The evening meeting which was held in the church was opened by singing "America."

Reports from delegates from the visiting societies were given and the resolutions formulated by the committee were read and adopted. These resolutions were as follows:

Whereas the organized Rural Clubs of Rock county need the help of each other

Be it resolved that these clubs federate, and at the invitation of the Rock County Farmers' Improvement Association affiliate themselves with that organization

Further be it resolved that clubs not represented here may become members of the federation by applying to the acting secretary of the association

Further be it resolved that the clubs here recommend the organization of committees and recommend chairmen of the committees who shall be members of the executive committee of the Rock County Farmers' Improvement Association.

The chairmen of these committees to be as follows:

Chairman of rural clubs committee, J. E. Wallin; chairman boys' and girls' committee, Clayton Stoney; chairman soils committee, R. J. Clark; chairman live stock committee, E. H. Parker; chairman farm management committee, W. J. Dougan; chairman women's work committee, Cora Thorsen; chairman crops committee, E. L. Bingham.

Be it further resolved that these clubs recommend that the county agent be the acting secretary of the Rock County Farmers' Improvement Association until the next annual meeting.

Signed by committee
J. E. Wallin
Chas. Shumead
A. M. Batang

A piano solo by Miss Etta Hubbell and a song by C. W. Raymond preceded the illustrated lecture given by Prof. C. J. Galpin on farm conditions in Norway and Denmark as contrasted with Rock county. The beautiful pictures were taken by Professor Galpin during a recent trip to those countries.

While the crowd was not as large as could be desired, owing to the condition of the roads and the damp weather, yet it was very enthusiastic and much interested in the program and especially in the accomplishment of the real object of the meeting—the federation of the farmers' clubs of the county into a practical, workable organization through which any line of work looking to the betterment of farm life and farm conditions in the county can be carried out. The county agent now has an organization through which he can work to accomplish practical results. Much credit is due our efficient county agent, Mr. L. A. Markham, for his efforts in bringing this about.

These are times when loyalty to our country means much. Loyalty to our country means loyalty to our own community right here at home. To help make our community more efficient as a helpful factor in our country's production, to help in its general uplift in all ways possible and especially to join and work through any organization which has for its object the betterment of conditions right here at home is one of the highest hopes of patriotism.

A patriotism that says much about helping our country in times of war and yet refuses to lift a hand to help the community uplift, but rather stands outside and criticises and scoffs at such efforts in a cheap kind of patriotism and is not taken seriously at such times as these.

To foster a patriotism that will serve our country's interests in times of war and in times of peace by serving our own community's best interests is one of the objects of this federation of farmers' clubs.

The first annual meeting of the association will be held at Janesville some time in January. It is hoped by that time all the farmers' clubs will have become members of this county association. J. E. Wallin,

President Fulton Social Center, Edgerton, Rock county, Wis.

Farmers' Courses.

Farmers' courses are already started in Wisconsin, and much loyalty and enthusiasm for home defense measures and increased food production along all lines is evident.

Many applications for these community meetings have been received to date; in fact, far more than could well be taken care of by the state agricultural extension workers. The list as scheduled now is as follows: December 12th-13th, Green Lake; January 8th-9th, Vesper and Black Creek; January 10th-11th, New London; January 11th-12th, Portage ,and Mauston; January 15th-16th, Algoma; January 16th-18th, Sturgeon Bay; January 20th-22d, Amherst; January 24th-25th, Ogdensburg; January 31st-February 1st, Onalaska; March 12th-13th; Mondovi; March 14th-15th, Roberts.

As fast as other towns get into line and file petitions for the meetings the list will contain them. The meetings have been shortened to two days.

How Long Will a Battery Last?

That depends to a tremendous extent on the quality of the insulation between the plates.

It is the insulation that protects the plates from contact with one another—and consequently ruining the battery.

In perfecting Threaded Rubber Insulation, Willard has developed the sturdiest, most durable battery insulation made—one which greatly reduces the chances of "broken down" insulation.

This important factor in long battery life is backed up by Willard Service, which will test and fill your battery regularly, give you good advice in battery care, and offers expert work when you need repairs or recharging.

Write us for booklet A-1, "196,000 Little Threads" and list of Willard Service Station addresses.

International a Food Training Camp.

(Continued from page 1.)

a stockman could be found, pencil in hand, jotting down items of instruction from those charts thereby obtaining specific and direct information.

Owing to the heavy loss that annually occurs among hogs and cattle because of the presence of tuberculosis, a successful attempt was made this year by the Chicago Live Stock Exchange to inaugurate a movement designed to eventually eliminate this disease. The loss from tuberculosis at the seven principal live stock markets during a twelve-month period amounts to fifty trainloads composed of forty cars each. At present prices this amounts to $50,000,000, and the food administration has called attention to the importance of inaugurating some system of stamping out the disease that will check at least part of this loss. Mr. H. R. Smith, commissioner of the Live Stock Exchange, succeeded in bringing together a large number of stockmen and sanitarians to launch a movement designed to lessen this loss. It was the consensus of opinion among those present that it will be advisable in the firt place to work out some sort of system with pure-bred herds by which breeders would be given a certificate indicating that they have an accredited or a disease-free herd after complying with certain requirements. At the present time the requirements of the different states are not similar and it was urged at this meeting that a special attempt be made to make them similar. Congressman Sloan, of Nebraska, has in charge a bill that will be presented at the coming session that will call for an appropriation of $1,000,000 to be used by the animal husbandry division of the department of agriculture for the purpose of stamping out the disease which is causing the enormous loss above referred to. The general plan is to place the burden partly on the federal government, partly on the individual states and very lightly on the breeder of pure-bred stock. Loss in hogs from tuberculosis shows up invariably where they follow diseased cattle, there being very little disease propagated through inheritance. Instances have been known where half the hogs following a diseased dairy herd were unfit for human food. The movement that was started last week by the Live Stock Exchange is one that should receive the endorsement of every man who is giving his support to the policy of sensible conservation. Nothing can be more short-sighted than to work heroically in the saving of small amounts when at the same time we are allowing this tremendous annual waste from disease.

Special interest always centers around the grand champion steer of the show and this year, as has become quite the custom, the prize was landed by one of the experiment stations. The foreign judge, Mr. Cridlan, was unable to be present and the task allotted to him fell to T. E. Robson, the well-known Canadian judge and stockman. To Purdue University, or, rather, to the Indiana Experiment Station, belongs the honor of breeding and fitting the grand champion steer, Merry Monarch, a 1,600-pound two-year-old pure-bred Short-horn of the richest breeding, being a grandson of the great Whitehall Sultan, of show yard fame. The winner in this case, according to J. S. Douglas, superintendent of live stock at the Indiana station under Prof. J. H. Skinner, the chief of the department, was never a pampered steer and was never tided over the hard periods of life by a nurse cow. He has been carried along since babyhood on the milk of his dam, plenty of good grass and an abundance of ensilage along with cracked corn, ground oats and oil meal. During the last six months he has been fed three times daily on cracked corn and ground oats with a little barley, and beginning September 1st one meal of cooked rye was fed daily with the amount of corn gradually reduced. The grain ration consisted of from six to eight pounds of cracked corn, three to five pounds of ground oats, and, as said before, a light ration of cooked rye along with ten pounds of corn ensilage fed in two feeds daily, together with all the clover hay that he would consume. Merry Monarch was presented to the judge in an absolutely ripe condition, being a notably smooth-fleshed steer, a deep-bodied fellow with character showing all over him, and if one could overlook the "heifer type" characteristic of the hind quarters, as indicating wasty cutting, there and then his defects ended. The winning of this prize brings great renown to the Short-horn breed and reflects remarkable credit upon the feeding methods employed at the Indiana station. The selling price of this steer, namely, $2.10 a pound, was a record breaker. Merry Monarch first sold for $2.05 per pound to the American Short-horn Breeders' Association and afterwards sold at $2.10 to Armour & Co., and the proceeds donated to the Red Cross Society.

There was lively interest shown in the educational exhibit installed by the bureau of animal industry of the department of agriculture in the form of a sheep movie. This was nothing more nor less than a display of the details involved in the process of transforming raw wool into the finished product. Beginning with the sheep, every detail of the operation was shown, including cleaning, scouring, grading, carding, spinning and weaving. Of special importance to the visitor was the apparent large percentage of waste due to dirt and foreign materials in wools, this running all the way from 5 to 20 per cent. Never before has so much interest in mutton and wool production been shown as at the present time and the endeavor of the department of agriculture to give special attention to this important subject met with hearty commendation from exposition visitors last week. According to statistics presented by the department, it requires the product of twenty-one sheep to maintain a single soldier under arms, and, this being the case, it becomes apparent at once that production must be increased if we are in the near future to take care of our army and supply our home markets.

No feature of the International was of greater interest than the draft horse classes, considering the fact that most of the entries were American bred. There were thirty and even forty horses in some of the younger classes, every one of which was bred on an American farm, and there was in evidence plenty of scale, substance and quality. Those who have been pessimistic over the possibilities of American horsemen attaining the high standards reached in Europe were most agreeably surprised last week by the character of the entries in the leading draft breeds. More and more we are settling down to deal with the drafter, as the automobile has practically eliminated the road horse. There is a brisk demand for good draft geldings and a look into the future reveals the fact that there is an important place yet in the industries for good, big, active work horses. In no single department of the International has greater progress been made than in the class of American-bred horses, and there were hundreds of men present last week who can recall periods in the early days of the International when scarcely a single creditable American-bred horse was shown. While it is true that the stoppage in the importation of drafters has been made a necessity, yet it is also true that the management of the International has been endeavoring to encourage in every possible way the breeding of pure-bred draft horses in this country, and it looks now as if we had at last firmly established this important industry.

There were twelve entries in the stock judging contest this year, that is, students were entered from twelve educational institutions. Prof. J. H. Shepard, of the North Dakota Experiment Station, was in charge and everything was carried through according to program. The International since the beginning has favored the holding of these contests, the management believing that they tend to stimulate interest in better live stock. Many individuals now occupying a high place in the animal husbandry world have in the past been on these judging teams. The list includes Chas. Gray, secretary American Aberdeen Angus Breeders' Association; Wayne Dinsmore, secretary of the American Percheron Society of America; R. J. Kinzer, secretary American Hereford Breeders' Association; H. J. Gramlich, professor of animal husbandry at the University of Nebraska, and many others. In this year's contest the students from Nebraska carried away first honors, their rating being 3,972 points. Kansas was second, with 3,651 points, while third place was allotted to the students from the Texas Agricultural College, with a rating of 3,644 points. Then followed the University of Minnesota, with a rating of 3,618 points, while the students from the Iowa Agricultural College won fifth place with 3,579 points. In this connection it is interesting to note that a member of the judging team from the Iowa agricultural College was Miss Edith Curtiss, a daughter of Prof. C. F. Curtiss, dean of agriculture. Miss Curtiss stood fifth as an individual among the sixty students who entered the contest. The remaining institutions in the order of their winnings were University of Missouri, 3,578 points; Purdue University, 3,542 points; Pennsylvania State College, 3,537 points; Ohio State University, 3,520 points; Ontario Agricultural College, 3,433 points; North Dakota Agricultural College, 3,419 points; South Dakota Agricultural College, 3,343 points.

Although official figures of the attendance are not available, it is a safe assertion to say that it was a "near" record breaker, if, indeed, a new record was not established. As many as 45,000 persons passed through the turnstiles in one day and when one considers that the fair was under full steam for seven days it may safely be concluded that the great exhibits installed this year were inspected by 150,000 or 200,000 persons. True it is that the amphitheater was filled at each evening performance, but previous to the performance those in attendance fairly lined the stalls and pens, all being more or less directly or indirectly interested in animal husbandry. Sightseeing at the International never was so favorable as this year. Stalls and pens had been provided for the large increase in entries and every visitor had clear sailing in the pleasurable task of inspection. The visitors to the show included a considerable number of Canadian stock men, while, in addition, many officials of the Canadian government were present to study the details of this great American exposition. Canada has used the provincial and Dominion fair system to a very large extent in building up her live stock industry and a most commendable interest was manifest by those who officially represented Canada.

Irvine's Grand Champion Belgian Mare, Lista.

BREEDING CATTLE.

Short-horns.—The wonderfully fine display of Short-horns was one of the features of this show. Never before have the classes been so large or so full of high quality animals. The judging, which was done by W. A. Dryden, Brooklyn, Ontario, was an exceedingly hard job. Several times Mr. Dryden called on the consulting judge, Robert Miller, Stouffville, Ontario, for help in deciding the cases that were most difficult to place. In spite of the larger classes the judging was done apparently to the satisfaction of everyone, for not a word of complaint from the ringside was heard. The aged bull class, consisting of ten entries, was a magnificent one, as it stood with Maxwalton Commander, owned by Gillespie & Son, of Oklahoma, at its head. This bull later was made grand champion. This was the first show of any consequence at which Maxwalton Commander had been exhibited this year and his superior quality was a surprise to many breeders. He was shown at the International last year and at that time stood very well in his class. Maxwalton Commander is a little over four years old, a handsome roan, and of great prepotency. He was sired by the great champion of champions, Avondale and is out of Imp. Roan Lady 36th. But this bull was by no means the whole show in the aged class, and noted sires as Lespedeza Sultan, Revolution and King Cumberland 3d showed against him with six others of great merit. The grand champion of the Des Moines fair at the opening of the show season had to be contented with eighth place in this class.

The two-year-old class, headed by Imperial Mistletoe, of Lespedeza Farm, was also a very fine one. The senior and junior yearling classes each had 10 head in the ring. The senior and junior bull calf classes were very large, containing 31 and 32 entries each. Nothing, perhaps, created greater interest than the senior calf class, as it contained Anoka Champion, the calf which was sold at the Anoka Farms sale just prior to the Chicago show, for over $17,000. "Will he head his class?" was in the minds of every Short-horn man at the show. He was in fine show condition and admittedly a superior calf. But there was a better one in the ring—Sunrise by Cornerstone, owned by Eliason, of Minnesota. It took both judges a long time to decide between the two, but they finally gave the honors to the Minnesota calf. After the judging was all completed Carpenter & Ross tried to buy Sunrise, but didn't succeed, though they offered Mr. Eliason $30,000 for the bull. Mr. Eliason had promised not to sell the bull at any price before he left for the show. Royal Stamp, the senior bull calf that stood third in this class sold for $5,000 at the Anoka sale. The junior calf class was headed by a splendid entry of H. C. Lookabaugh, which later became a close contender for junior championship honors.

Twelve aged cows with calves at foot presented an imposing sight when brought together in their class. Maxwalton Queen by the great, Avondale, owned by B. F. Hale, was awarded first place. The two-year-old class was headed by the Carpenter & Ross cow, Imp. Lady Dorothy, that has been a consistent winner of grand championships at leading shows this fall. She was later made grand champion cow, a well-deserved honor. Second place in this class was won by the Rose Hedger entry, Viola by Maxwalton Prime, the grand champion of the American Royal this fall. The senior yearling class had an outstanding winner in Lady Clara 9th, owned by Eliason, though the heifer that took second was the grand champion female at the Hamline fair early in the show season. Purdy Bros., of Harris, Mo., were awarded fifth in

this class on their Lady Victoria, the junior champion at the Missouri State Fair.

The junior yearling heifers were headed by the splendid entry of Bellows Bros., Parkdale Victoria 8th, the junior champion female at the recent American Royal. This heifer was an outstanding winner in her class of 23 head, and it didn't take Judge Dryden long to find her. The senior calf class was the largest in the whole show; it numbered 44 head and it took a good one to hold first place. This was accomplished by the Lookabaugh calf, Pleasant Acres Belle, the grand champin female of the Oklahoma State Fair. The Uppermill entry, Villager's Clara, headed the junior calf class of 33 head, closely followed in quality by two most worthy entries. The contest for the junior championship was an interesting one, for though the Bellows Bros. heifer, Parkdale Victoria 8th, was an outstanding individual, she had strong competition in the three first prize winners against which she was shown. The judge's decision in favor of this Missouri heifer, however, was popular. The awards follow in detail:

Exhibitors—Allen Cattle Co., Colorado Springs, Colo.; Anoka Farms, Waukesha, Wis.; Bellows Bros., Maryville, Mo.; H. G. Bowers, Elmwood, Ill.; L. F. Boyle, Hennepin, Ill; James Brown, Dundee, Ill.; Carpenter & Ross, Mansfield, Ohio; Frank Edwards, Tiffin, Ohio; S. G. Eliason, Montevideo, Minn.; Robert Failon, Neponset, Ill.; A. R. Fennern, Avoca, Ia.; I. M. Forbes & Son, Henry, Ill.; F. A. Gillespie & Sons, N. Muskogee, Okla.; B. F. Hale, Prairie View, Ill.; Wm. Henn, Kansas City, Mo.; Wm. Herkelman, Elwood, Ia.; Jackson & White, Hurley, S. D.; Eben E. Jones, Rockland, Wis.; J. E. Kennedy, Janesville, Wis.; J. A. Kilgour, Sterling, Ill.; James P. Lanaghan, Charlotte, Ia.; H. M. Lee, Highgate, Ont.; Lespedeza Farm, Hickory Valley, Tenn.; H. C. Lookabaugh, Watonga, Okla.; O. C. Lower, Atlantic, Ind.; Theo. Martin, Bellevue, Ia.; Maxwell-Miller Cattle Co., Steamboat Springs, Colo.; Jos. Miller & Sons, Granger, Mo.; E. W. Monnier, Elizabeth, Ill.; John McCord, Palos Park, Ill.; J. W. McDermott, Kahoka, Mo.; Ohio State University, Columbus, Ohio; H. H. Powell & Son, Linn Grove, Ia.; J. F. Prather, Williamsville, Ill.; H. Pritchard & Son, Walnut, Ia.; Purdy Bros., Harris, Mo.; Pine Run Farm, Penllyn, Pa.; Howell Rees & Sons, Pilger, Neb.; Reynolds Bros., Lodi, Wis.; W C. Rosenberger, Tiffin, Ohio; Park E. Salter, Wichita, Kan.; Silver Brook Farm, Inc., Muncie, Ind.; Tom Stanton, Wheaton, Ill.; E. J. Thompson & Son, Hurley, S. D.; Frank Toyne & Son, Lanesboro, Ia.; University of Illinois, Urbana, Ill.; Uppermill Farm, Wapello, Ia.; Robert R. Ward & Sons, Benton, Ill.; D. Warnock & Sons, Loveland, Colo.; R. E. Watts & Sons, Miles, Ia.; Williams Bros., Bangor, Wis. Judge, W. A. Dryden, Brooklyn, Ontario.

Bull 3 years or over (10 shown), 1st Gillespie & Son on Maxwalton Commander, 2d Lespedeza Farm on Lespedeza Sultan, 3d Carpenter & Ross on Revolution, 4th Powell & Sons on King Cumberland 2d, 5th Toyne & Son on Eastlawn's Champion, 6th Rosenberger on Maxwalton Pride, 7th Herkelman on Cumberland Standard, 8th Fennern on Choice Cumberland, 9th Bellows Bros. on Parkdale Baron, 10th Henn on Snowstorm; 2 years and under 3 (10 shown), 1st Lespedeza Farm on Imperial Mistletoe, 2d Hales on Field Marshal, 3d Ward & Sons on Senator, 4th Forbes on O. K., 5th Bellows Bros. on Parkdale Rex, 6th Stanton on King's Heir (Imp.), 7th Failon on White Gloster 2d, 8th Warnock & Son on Model Type, 9th Reynolds Bros. on Royal Choice 2d, 10th Pine Run Farm on Red Memory; senior yearling (10 shown), 1st Uppermill Farm on Villager's Coronet, 2d Thompson & Son on Ford Sultan, 3d Watts & Sons on Mysie Champion, 4th Crain on Mount Victoria Type, 5th Jackson & White on Dale Villager, 6th Reynolds Bros. on Ruby's Knight, 7th Gillespie & Son on Nonpareil Scott, 8th Miller & Son on Dale Cumberland, 9th Williams Bros. on Collynie Stamp, 10th Carpenter & Ross on Clan Avondale; junior yearling (21 shown), 1st Lespedeza Farm on Sultan's Beau, 2d Carpenter & Ross on Maxwalton Dower, 3d Bellows Bros. on King Baron, 4th Rosenberger on Sultan Lord, 5th McDermott on Cumberland Marshal 4th, 6th Purdy Bros. on Count Victory, 7th Maxwell Miller Cattle Co. on Princely Stamp, 8th Lookabaugh on Pleasant Dale 4th, 9th Toyne & Son on Crescent Dale, 10th Carpenter & Ross on Maxwalton Landmark; senior calf (31 shown), 1st Eliason on Sunrise, 2d Anoka Farms on Anoka Champion, 3d Anoka Farms on Royal Stamp, 4th Pritchard & Son on Dale Reliance, 5th Brown on Thaxton's Model, 6th Lespedeza Farm on Marshal's Gloster, 7th McDermott on Cumberland Marshal 5th, 8th Bellows Bros. on Supreme Choice, 9th Prather on Village President, 10th Purdy Bros. on Double Victor; junior calf (32 shown), 1st Lookabaugh on Fair Acres Sultan Jr., 2d Pritchard & Son on Dale Viscount, 3d Lespedeza Farm on Sultan's Memory, 4th Uppermill Farm on Villager's King, 5th Uppermill Farm on Villager's Signet, 6th Ward & Sons on Senator's Master, 7th Lespedeza Farm on Lespedeza Collynie, 8th Eliason on Cumberland's Seal, 9th Toyne & Son on Eastlawn's Champion Jr., 10th Carpenter & Ross on Maxwalton Mainstay.

Gillespie & Son's Grand Champion Short-horn Bull, Maxwalton Commander.

Cow 3 years or over (12 shown), 1st Hale on Maxwalton Queen, 2d Gillespie & Sons on Lavina Cumberland 3d, 3d Carpenter & Ross on Max Mina 8th, 4th Jones on Verbena of Oakdale, 5th McCord on Villager Rose, 6th Toyne & Son on Bonnie Belle 14th, 7th Lespedeza Farm on Violet Queen 2d, 8th Boyle on Sultana, 9th Kennedy on Baroness Lady 7th, 10th Toyne & Son on Village Lassie 2d; 2 years and under 3 (11 shown), 1st Carpenter & Ross on Lady Dorothy (Imp.), 2d Rosenberger on Viola, 3d Gillespie & Sons on Lucile, 4th Edwards on Hampton Queen, 5th Carpenter & Ross on Carrie's Last, 6th Kennedy on Windsor Belle 23d, 7th Martin on Woodlawn Ruby, 8th Toyne & Son on Lovely Goods 2d, 9th Edwards on Winifred 9th, 10th Maxwell, Miller Cattle Co. on Silver Blythesome; senior yearling (18 shown), 1st Eliason on Lady Clara 9th, 2d Eliason on Violet Maid 8th, 3d Herkelman on Northcote Gypsy Maid, 4th Jackson & White on Lustris Lass, 5th Purdy Bros. on Lady Victoria, 6th Hale on Anoka Clipper 3d, 7th Carpenter & Ross on Max Damsel, 8th Jones on Victoria Cumberland, 9th Carpenter & Ross on Cumberland Queen; 10th Prather on Village Blossom 8th; junior yearling (23 shown), 1st Bellows Bros. on Parkdale Victoria 8th, 2d Gillespie & Sons on Duchess of Gloster 80th, 3d Rosenberger on Village Gwynne, 4th Rosenberger on Village Gem, 5th Miller & Sons on Choice Mayflower, 6th Uppermill Farm on Villager's Graceful 2d, 7th Lookabaugh on Pleasant Princess, 8th Edwards on Hampton Queen 2d, 9th Bellows Bros. on Clara 70th, 10th Pritchard & Son on Victoria 73d; senior calf (44 shown), 1st Lookabaugh on Pleasant Acres Belle, 2d Bellows Bros. on Lovely of Parkdale 15th, 3d Forbes & Son on Linwood Clara 9th, 4th Anoka Farms on Fanny Anoka, 5th Carpenter & Carpenter on Mysie's Diamond, 6th Uppermill Farm on Villager's Maurine, 7th University of Illinois on Illini Sultana, 8th Anoka Farms on Columbia Anoka, 9th Bellows Bros. on Queen of Beauty 36th, 10th Edwards on Oakdale Mary Ann; junior calf (33 shown), 1st Uppermill Farm on Villager's Clara, 2d Rosenberger on Cloverleaf Gloster, 3d Uppermill Farm on Villager's Lassie, 4th Warnock & Son on Model Lady, 5th Hale on Rosewood Lady 2d, 6th Anoka Farms on Augusta Anoka 5th, 7th Boyle on Gloster Lady 7th, 8th Pritchard & Son on Victoria 74th, 9th Anoka Farms on Augusta Anoka 6th, 10th Jones on Hillshade Beauty.

Senior champion bull, Gillespie & Son on Maxwalton Commander; junior champion bull, Eliason on Sunrise; grand champion bull, Gillespie & Son on Maxwalton Commander; senior champion cow, Carpenter & Ross on Lady Dorothy; junior champion heifer, Bellows Bros. on Parkdale Victoria 8th; grand champion cow, Carpenter & Ross on Lady Dorothy.

Young herd (11 shown), 1st Eliason, 2d Bellows Bros., 3d Uppermill Farm, 4th Rosenberger, 5th Carpenter & Ross, 6th Lookabaugh, 7th Lespedeza Farm, 8th Allen Cattle Co.; calf herd (13 shown), 1st Lookabaugh, 2d Anoka Farms, 3d Uppermill Farm, 4th Eliason, 5th Bellows Bros., 6th Pritchard & Son, 7th Lespedeza Farm, 8th Rosenberger, 9th Forbes & Son, 10th Allen Cattle Co.; get of sire (11 shown), 1st Anoka Farms, 2d Carpenter & Ross, 3d Uppermill Farm, 4th Lookabaugh, 5th Eliason, 6th Bellows Bros., 7th Pritchard & Son, 8th Lespedeza Farm, 9th Edwards; Celedonia Pereda trophy for best 3 Short-horn bulls, F. W. Harding; won last year by Bellows Bros.; Pedro T. Pages trophy for best 3 Short-horn bulls, Uppermill Farm; Carlos M. Duggan trophy for best 2 head, bull and female, Eliason.

Milking Short-horns.—Exhibitors: A. T. Cole, Wheaton, Ill.; Robert Crane, Mt. Victoria, Md.; Findley McMartin & Sons, Claremont, Minn.; Otis Herd, Willoughby, Ohio; D. B. Smith, Mission Hill, S. D.; J. E. & C. B. Wade, Orangeville, Ohio. Judge, Robert Miller, Stouffville, Ontario.

Bull 3 years or over (5 shown), 1st Wade on Queenston Duke, 2d Smith on Penn Johnson, 3d Wade on Glenside Cyrus, 4th McMartin & Sons on Hartford Welfare, 5th Otis Herd on Knight of the Glen; 2 years and under 3 (1 shown), Otis herd on British Prince; 1 year and under 2 (2 shown), 1st Wade on Fairfield King, 2d Otis Herd on Corporal Peach; under 1 year (6 shown), 1st and 2d McMartin & Sons on Welfare Champion and Royal Welfare, 3d and 4th Smith on Sultan Clay and Glenside Lee, 5th and 6th Wade on Master of the Glenn and Edgewood Prince.

Cow 5 years or over, in milk (9 shown), 1st, 2d, 3d, 4th and 5th Otis Herd on White Rose, Braemar Beauty, Nugget's Pride 8th, Bright Lilly (Imp.) and Christmas Rose (Imp.); 3 years and under 5, in milk (5 shown), 1st McMartin & Sons on Roan Lily, 2d Wade on Glenside Honora, 3d Cole on Charming Daughter, 4th Otis Herd on Model "T" 2d, 5th Wade on Bouncing Maid 2d; 2 years and under 3 (7 shown), 1st, 2d and 3d Otis Herd on Rose Clyde, Princess Royal and Glenside Lass, 4th Wade on Glen Laura, 5th Otis Herd on Peach Blossom, 6th Wade on Daisy Washington; senior yearling (5 shown), 1st Otis Herd on Lady of the Glen, 2d Cole on Charming Mille, 3d Wade on Queenston Lady, 4th Otis Herd on Princess Jewel, 5th McMartin & Sons on Christobel; junior yearling (7 shown), 1st and 2d Otis Herd on Blanche's Jewel and Soobagh Darling, 3d McMartin & Sons on Snow Drop, 4th Wade on Regal Duchess, 5th and 6th Otis Herd on Lady Princess and Hopeful Lady; senior calf (8 shown), 1st Wade on Glenwood Marjorie, 2d, 3d and 4th Otis Herd on Roan Maud 5th, Lady Ruby and Lady Maggie, 5th McMartin & Sons on Roan Maud 4th, 6th Wade on Lady Eleanor; junior calf (6 shown), 1st and 2d McMartin & Sons on Red Bud 2d and Snowball 2d, 3d Wade on Glenwood Dairymaid, 4th McMartin &

A useful gift from a thoughtful giver

President Suspenders for comfort

and for Christmas

The universal favorite—3,000,000 pairs sold last year—so free and easy and great for wear—the best suspender quality at any price. A Safe purchase because we Guarantee Satisfaction

Buy of any dealer anywhere. Look for the name on the buckle. If the ones you buy are not satisfactory, in every way, mail them to us. We will repair, replace, or (if requested) refund your money.

The Three Champion Steers of the Show.

On the left, Merry Monarch, grand champion over all breeds; in the center, Kershaw's champion Angus steer, Muskogee, and on the right, the champion Hereford steer, Standard Lad 4th, shown by the University of Missouri.

Sons on Merry Maid 2d, 5th and 6th Otis Herd on Roan Mabel and Lady Rose.

Senior champion bull, Wade on Queenston Duke; junior champion bull, McMartin & Sons on Welfare Champion; grand champion bull, Wade on Queenston Duke; senior champion cow, Otis Herd on White Rose; junior champion heifer, Otis Herd on Lady of the Glen; grand champion cow, Otis Herd on White Rose; aged herd (2 shown), 1st May, 2d McMartin & Sons; young herd (3 shown), 1st Otis Herd, 2d Wade, 3d McMartin & Sons; calf herd (5 shown), 1st and 2d McMartin & Sons, 3d Wade, 4th Otis Herd, 5th Wade; get of sire (5 shown), 1st Otis Herd, 2d McMartin & Sons, 3d Otis Herd, 4th Wade, 5th Otis Herd.

Produce of cow (5 shown), 1st Otis Herd, 2d Wade, 3d Cole, 4th Otis Herd, 5th Wade.

Herefords.—The Hereford show was by all odds the largest that has ever been seen at the International and there is no question but that it was also the best show of individual merit this breed has ever presented. In watching such an array of superb bulls as the Hereford men brought out one thought is driven home to stay and that is the value of the registered sire for building up not only pure-bred, but also the common herds throughout the country. If more cattle raisers would attend this great International show from year to year it would become a most powerful institution in the improvement of live stock throughout the country, for it is simply out of the question to see the superb cattle at this great exhibition without becoming an enthusiast for better stock and there is perhaps no breed that is so impressive in that respect as the Hereford.

When the sixteen aged bulls lined up in their class to be placed by Judge J. F. Green, of Gregory, Texas, it looked as though it might take him hours to pick the winners, and it did take a lot of conscientious work. First place, however, was easily filled by Ardmore, the undefeated winner at this year's shows. This great bull, owned by W. L. Yost, of Kansas City, Mo., is very low set, exceedingly thick-fleshed, and a typical Hereford. He is a dark cherry in color and almost a perfect specimen of bovine excellence. In competition with the other first prize winners he won the grand championship without half trying, and what is more, everybody expected him to win the minute he appeared in the show ring. He was never in better form than he was at this show and that is saying a good deal. Second place was awarded to Prince Brummel, from the Taylor herd in Kentucky, another thick bull of popular type. The Wisconsin bull of J. C. Robinson & Son, Maple's Lad 61st, was placed third in this class.

The two-year-old class, consisting of twelve entries, was another strong one. It was headed by Golden Lad 9th, a J. Crouch & Son entry. He was followed by Woodford 1st, another Yost entry, while third place was won by a Canadian bull, Beau Perfection 48th. Tippecanoe Ideal, owned by Van Natta, of Indiana, stood first in the senior yearling class and Woodford 9th, another Taylor entry, first in the junior yearling class. This young bull is a splendid individual and one of great promise for the future. Later he became the winner of junior championship honors, but had to give way to Ardmore in the contest for grand championship. The calf classes were both large—the seniors having thirty-two and the juniors twenty-seven entries. In the former, Cavalier, owned by E. F. Swinney, of Kansas City, stood first, and to Larry Perfect, another Swinney entry, first place was awarded in the latter class. Both were outstanding individuals.

There was no lack of quality in the aged cow class, fifteen strong. Here the judge found an easy winner in Clive Iris 3d, a low-down, heavy-set, thick-meated cow belonging to Taylor of Kentucky. This cow was not only an easy winner in her class, but she had no more difficulty in carrying away both senior and grand championship honors as the show progressed. There were many splendid specimens in the aged cow class, notable among which were Bonnie Dee, owned by Robinson & Son, and Dorothy Donald 6th, a Yost entry. The two-year-old class had seventeen contestants, first among which stood Taylor's Woodford Lady 5th. Next to her the judge placed a Montana heifer, Lady Perfection 3d, owned by A. B. Cook, of Townsend. Shadeland Jewel 2d, owned by B. T. Bartlett, of Greencastle, Mo., occupied first place in the senior yearling class. Yerba Santa, owned by Robt. H. Hazlett, of Eldorado, Kan., was an outstanding winner in the junior yearling class. This heifer later became junior champion, although the competition for this honor was strongly contested by the first prize winner in the senior calf class, Princess H, a Taylor entry. The winner in the yearling calf class, another Taylor entry, Madam Donald 2d, was also a splendid individual, as she had to be to win in a class of twenty-eight.

Donald, 7th Mousel Bros. on Capitola Mischief, 8th Mousel Bros on Bell Mischief 4th, 9th Cook on Lady Joy, 10th Engle & Sons on Belle Blanchard 49th.

Senior champion bull, Yost on Ardmore; junior champion bull, Taylor on Woodford 9th; grand champion bull, Yost on Ardmore; senior champion cow, Taylor on Woodford Lady 5th; junior champion heifer, Hazlett on Yerba Santa; grand champion cow, Taylor on Woodford Lady 5th; aged herd (8 shown), 1st Taylor, 2d Yost, 3d Cook, 4th Robinson, 5th Crouch & Son, 6th Enochs Farm; young herd (16 shown), 1st Dallmeyer, 2d Hazlett, 3d Swinney, 4th Yost, 5th Cook, 6th Robinson & Son, 7th Velie, 8th Engle & Sons, 9th Andrews & Sons, 10th Van Natta; calf herd (20 shown), 1st Hazlett, 2d Taylor, 3d Swinney, 4th Cook, 5th Engle & Sons, 6th Dallmeyer, 7th Velie, 8th Robinson & Son, 9th Yost, 10th Mousel Bros.; produce of cow (9 shown), 1st Cook, 2d Yost, 3d Taylor, 4th Crouch & Son, 5th Engle & Sons, 6th Robinson & Son, 7th Swinney, 8th Andrews & Sons.

Get of sire (15 shown), 1st Yost, 2d Robinson & Son, 3d Swinney, 4th Dallmeyer, 5th Cook, 6th Engle & Son, 7th Dallmeyer, 8th Swinney.

Aberdeen Angus.—The Angus show was somewhat smaller than usual, but the cattle entered were from the best herds in the country. They were the seasoned winners at this year's shows—the very cream of the Doddy breed. Dr. H. M. Brown, of Hillsboro, Ohio, did the judging and did it to the satisfaction of everyone concerned. The aged bull class consisted of only three entries, but they were exceedingly fine and it was no small job for the judge to decide between them, but he finally placed Broadus Norwood 3d, owned by Cecil & Sons, in first place. The veteran Blackcap Bertram of show yard fame, owned by the Caldwells, of Burlington Junction, Mo., was placed second. In the three-year-old class nine entries were lined up for the judge's decision. The Eckardt bull of New York, Imp. Evenest of Bleaton, headed the class with an Ames entry from Tennessee 2d. To Beginner, owned by Escher & Ryan, third place was given. When the two first bull classes had been placed one began to hear guesses made as to which would become senior and grand champion male, with everyone guessing that Broadus Norwood 3d would be the lucky one and so he proved to be. Empson, one of the Tennessee entries, headed the class of ten senior yearling bulls with Enlate, from the herd of Escher & Ryan, second. The junior yearlings were nicely topped by Ames Plantation Beau, a splendid entry from Tennessee. Next to him stood a youngster from Washington, owned by Congdon & Battles. Escher & Ryan furnished the first in the senior calf class in Bar Marshall, while the Caldwells, of Missouri, contributed first in the junior calf classes with Entian. In selecting the junior champion the judge had no difficulty in deciding in favor of the junior yearling, Ames Plantation Beau.

The aged cow class was an exceedingly strong one. In the first place there were eleven matrons in the ring and all were of the big, smooth, well-fitted kind, so typical of the breed. The Cecil cow, Hillsdale Pride, was placed at the head of her class. The Caldwells' entry, Queen Molly of Sun Dance 3d, was a mighty close competitor for this place, but finally had to be satisfied with second. In the two-year-old class Blackbird Velvet, belonging to the Missouri Caldwells, became winner of first without any difficulty. While Blackbird Velvet is a splendid individual and was in good form, she was beat for senior championship honors by the winner in the aged class, Hillsdale Pride, which later also was pronounced the grand champion. Escher & Ryan furnished the head for the senior yearling classes, Blackbird Gift 13th. The junior yearlings were headed by Queen of Rosemere from the herd of Congdon & Battles, North Yakima, Wash. This heifer later became the junior champion of the breed. In the senior calf class Hillsdale Pride 13th, an Ohio Caldwell entry, stood first, while the corresponding place in the junior calf class was given to the Missouri Caldwell entry, Eritus 5th.

Cow 3 years or over (11 shown), 1st Cecil & Sons on Hillsdale Pride, 2d C. D. & E. F. Caldwell on Queen Molly of Sun Dance 3d, 3d Congdon & Battles on Quissy of Meadowbrook, 4th Cutler

Fertilizers Pay Better Than Ever

TODAY a bushel of corn or wheat buys more fertilizer (potash excepted, of course) than at any time during the past three years. Note how much cheaper you can buy a 2-10 fertilizer now than before the war.

In 1914 would buy

Today will buy

In terms of farm products, fertilizers cost less today than in 1914.

Fertilizers paid you *then*—they will pay you better *now*.

Fertilizers are today more profitable and more necessary to efficient production than before the war. Boost crop production, grow more per acre and increase your profits by using fertilizer.

Help both the railroads and yourself by ordering Spring Fertilizers NOW.

Caldwell, 5th Congdon & Battles.

Galloways.—The Galloway show was only moderate in size, though the cattle were well finished for exhibition purposes. A Carnot, the aged bull of H. & G. Croft, Bluff City, Kan., won first in class and senior championship, making him an undefeated winner in the 1917 shows. Junior championship was won by R. W. Brown, of Carrollton, Mo., on his senior yearling, Picador 2d.

The female classes, like those of the bulls, were all small. A good many breeders who had entered stock, for some reason or other, failed to bring their herds. In several cases this was due to transportation difficulties. Croft won first in the aged cow class on Carlotta of L. F. and later on was awarded the senior championship on her. This cow has been a consistent winner at the leading shows this fall and was in fine form at the International. Junior championship honors were taken by Isaac Lincoln, of Aberdeen, S. D., on his senior yearling heifer, Lady Florence 5th.

Exhibtiors—R. W. Brown, Carrollton, Mo.; H. & G. Croft, Bluff City, Kan.; Isaac Lincoln, Aberdeen, S. D.; Simmons & Eager, Hicksville, Ohio; Straub Bros., Avoca, Neb.

Bull 3 years old or over (3 shown), 1st Croft on A. Carnot, 2d Simmons & Eager on Mutineer, 3d Lincoln on Emperor of Drumlaurig; bull 2 years old and under 3 (2 shown), 1st Lincoln on General, 2d Simmons & Eager on Choice Hope; senior yearling (2 shown), 1st Brown on Picador 2d, 2d Croft on Rex of Greenbush; junior yearling (4 shown), 1st Lincoln on Bruseloff, 2d Straub Bros. on Varsity Scotty, 3d Brown on The Quaker, 4th Simmons & Eager on Coast Guard; senior calf (5 shown), 1st Lincoln on Milford L., 2d Brown on Quintilian, 3d Brown on Quibbler, 4th Simmons & Eager on Scotty of Windfall, 5th Simmons & Eager on Nick of Windfall; junior calf (2 shown), 1st Simmons & Eager on Jack of Windfall, 2d Croft on Elrod of Greenbush.

Cow 3 years old or over (4 shown), 1st Croft on Carlotta of L. F., 2d Croft on Little Mary of L. F., 3d Lincoln on Fatima, 4th Simmons & Eager on Mary Leslie; cow or heifer 2 years old and under 3 (4 shown), 1st Lincoln on Mandy, 2d Croft on Meadow Quen, 3d Brown on Our Dainty, 4th Brown on Oak Lass; senior yearling (4 shown), 1st Lincoln on Lady Florence 5th, 2d Lincoln on Maude 5th, 3d Croft on Evelyn of Greenbush, 4th Simmons & Eager on Grace of Windfall; junior yearling (4 shown), 1st Croft on Gwendoline 3d, 2d Lincoln on Florence 6th of L. F., 3d Simmons & Eager on Malmo, 4th Simmons & Eager on Worthy Dimple; senior calf (6 shown), 1st Lincoln on Meta May L. 6th, 2d Lincoln on Martha L. 6th, 3d Simmons & Eager on Meg of Windfall, 4th Simmons & Eager on Dainty of Windfall, 5th Croft on Vina 2d of Greenbush; junior calf (3 shown), 1st Croft on Silvia of Greenbush, 2d Lincoln on Betty I., 3d Brown on Rosalind.

Aged herd (3 shown), 1st Croft, 2d Lincoln, 3d Simmons & Eager; young herd (3 shown), 1st Lincoln, 2d Simmons & Eager, 3d Croft; get of sire (4 shown), 1st Lincoln, 2d Brown, 3d Simmons & Eager, 4th Croft; produce of cow (5 shown), 1st Lincoln, 2d Brown, 3d Lincoln, 4th Croft, 5th Simmons & Eager.

Red Polls.—With the present keen interest in dairying as well as in beef production, the Red Polled show at the International attracted unusual interest this year. This valuable breed of cattle has been steadily growing in popularity in recent years, due principally to the fact that it is in the hands of a large number of constructive breeders who seem to understand how to get a maximum of milk without sacrificing too much in beef-producing qualities. On the other hand, as one looked over the various classes as they were lined up before Judge E. R. Davis, of the University of Nebraska, one could not help but notice that there is a decided approach, particularly among the cows, toward the well-established dairy form which, of course, means loss in beef-making qualities. The bull classes were much smaller than the cow and heifer classes, but there was no dearth of quality. Teddy's Charmer, belonging to Larabee, of Illinois, the bull that has stood first in class at the leading shows this fall and was senior and grand champion at the Des Moines show, headed the aged class and later was made grand champion. The junior grand champion bull, Antone Charmer, also a Larabee entry, won over Homer, the bull that defeated him at both the Iowa and Illinois state fairs. The aged cow class was one of the finest classes in the Red Polled show. It consisted of fourteen splendid individuals, at the head of which stood Susie 2d, a Larabee entry. This cow is a large individual of good dairy form. The Red Polled men are paying more attention to size in the cows than they have been doing in the past, and this was undoubtedly one reason why this cow was placed first, for Constant, the one that took second in this class, was in many respects a more refined individual and other judges might have placed her first. She has an unusually well-developed udder. In the contest for junior championship the junior calf, Cosy Ells Dumplin, owned by Ineichen & Son, was an outstanding winner, but owing to her age did not compete against the fully developed aged cow, Susie 2d, which became the grand champion.

Exhibitors—Adolph P. Arp, Eldridge, Ia.; Clouss & Travis, Manson, Ia.; R. V. Graff, Bancroft, Neb.; Chas. Graff & Son, Bancroft, Neb.; W. S. Hill, Alexandria, S. D.; Geo. Ineichen & Son, Geneva, Ind.; Jos. Kestel, New Lenox, Ill.; J. W. Larabee, Earlville, Ill.; Chas. C. Pope Estate, Yorkville, Ill.; Quality Stock Farm, Kinmundy, Ill.; John Schmiesing, Ft. Laramie, Ohio; S. J. Smith, Chadwick, Ill.; University of Nebraska, Lincoln, Neb. Judge: E. R. Davis, University of Nebraska, Lincoln, Neb.

Bull 3 year or over (6 shown), 1st Larabee on Teddy's Charm, 2d Ineichen & Son on Principle, 3d Hall on Teddy's Perfection, 4th Graff & Son on Vina's International Dandy, 5th Smith on Gene, 6th Clouss & Travis on Charmer's Pride; 2 years and under 3 (4 shown), 1st Larabee on Billy Charm, 2d Arp on Marham, 3d Smith on Teddy's Choice, 4th Ineichen & Son on Master; senior yearling (2 shown), 1st Ineichen & Son on Teddy's Chief, 2d Smith on Ruth's Falstaff; junior yearling (4 shown), 1st Larabee on Homer, 2d Smith on Falstaff Dandy, 3d Hill on Lewis, 4th Pope Estate on Magic; senior calf (8 shown), 1st Graff & Son on Ringleader, 2d Ineichen & Son on Cosy Ell's Zeno, 3d Clouss & Travis on Master, 4th Larabee on Jeff, 5th Graff & Son on Rupert's Last; junior calf (13 shown), 1st Larabee on Antone Charmer, 2d Clouss & Travis on Ruen, 3d Ineichen & Son on Cosy Ell's Starlight, 4th Arp on Ruperta's Teddy, 5th Larabee on Roscoe Charmer, 6th Quality Stock Farm on Zero 2d; 7th Clouss & Travis on Allen.

Cow 3 years or over (11 shown), 1st Larabee on Susie 2d, 2d Hill on Constant, 3d Ineichen & Son on Cosy 2d, 4th Larabee on Jello, 5th Clouss & Travis on Rozell, 6th Smith on Red Ruby 3d, 7th Ineichen & Son on Geneva Zelma; 2 years and under 3 (12 shown), 1st Hill on Rue, 2d Smith on Fern, 3d and 4th Larabee on Miss Charmer and Lady Charmer, 5th Smith on Lady Corporal, 6th Ineichen & Son on Zelnett, 7th Smith on Cornelia; senior yearling (10 shown), 1st Graff on Beau Me, 2d and 3d Hill on Penelope and Brownie, 4th Ineichen & Son on Jewelett, 5th Larabee on Bessy Charmer, 6th Clouss & Travis on Myrtle; junior yearling (8 shown), 1st Ineichen & Son on Zel Rose, 2d Larabee on Graceful Charmer, 3d Schmiesing on Belle of Ell, 4th Ineichen & Son on Rosy Rose, 5th Arp on Diana Lassie 2d, 6th Smith on Pet's Golden Rule; senior calf (9 shown), 1st Larabee on Effie Charmer, 2d Ineichen & Son on Rosy Ell's Countess Ina, 3d Smith on Lady Stowe 7th, 4th Ineichen & Son on Cosy Ell's Bouquet, 5th Smith on Princess Durand, 6th Graff on Beattie; junior calf (10 shown), 1st Ineichen & Son on Cosy Ell's Dumplin, 2d Hill on Cecelia, 3d Clouss & Travis on Dora, 4th Larabee on Maxine, 5th Hill on Marion, 6th Arp on Iowa Jane 2d.

Senior champion bull, Larabee on Teddy's Charm; junior champion bull, Larabee on Antone Charmer; grand champion bull, Larabee on Teddy's Charm; senior champion cow, Larabee on Susie 2d; junior champion heifer, Ineichen & Son on Cosy Ell's Dumplin; grand champion cow, Larabee on Susie 2d; aged herd (7 shown), 1st and 2d Larabee, 3d Ineichen & Son, 4th Hill, 5th Clouss & Travis, 6th Ineichen & Son; young herd (4 shown), 1st Ineichen & Son, 2d Larabee, 3d Hill, 4th Smith; calf herd (5 shown), 1st Larabee, 2d Ineichen & Son, 3d Clouss & Travis, 4th Hill, 5th Smith; get of sire (8 shown), 1st and 2d Larabee, 3d Hill, 4th and 5th Ineichen & Son, 6th Clouss & Travis; produce of cow (11 shown), 1st Larabee, 2d Ineichen & Son, 3d Larabee, 4th Graff & Son, 5th Smith, 6th Hill.

Polled Durhams.—While the Polled Durham show was a good one, it broke no records. In fact, we believe that this breed has shown more cattle at some previous Internationals. The bull classes were all small, ranging from two to four animals in the older classes while as many as six entries were shown in the calf classes. The bull, Scotch Loch Dale, owned by the Leemon Stock Farm, of Hoopeston, Ill., won first in the aged class and was later made senior champion, defeating Roselawn Marshal, the Nebraska bull owned by Hultin that has been senior and grand champion at the leading western shows this fall. In the senior yearling bull class Royal Marshal, from the herd of Rose & Sons, of Indiana, was placed first and Sunny Sultan, the Achenbach bull that has been junior champion at the leading western shows this fall, had to be contented with fourth place, indicating, in a manner, the quality of the young bulls in this show. In the contest for junior championship, however, Royal Marshal was defeated by Proud Marshal, also a Rose & Sons entry. The aged cow class consisted of five entries at the head of which stood Sultana, the big, thick, heavy-fleshed cow of Achenbach Bros. that has been a leading winner in the West this fall. In the two-year-old class Princess Sultana, of the Leemon Farm, stood first, and in the contest for senior championship won over Sultana. There was considerable comment at the ringside on this decision. It did not seem to be very popular, the opinion being that the judge failed to recognize the difference in the ages of the two contestants. Sultana is a five year old and has been raising calves regularly, whereas Princess Sultana is a three year old. However, Judge Robbins justified his decision on the grounds that the older cow showed considerable patchiness behind, a defect that the Polled Durham breeders are striving to eliminate. Gloster Countess 2d, a Hultine entry, stood first in the senior heifer class and Lee Dale Mayflower C., of the Leemon Stock Farm, first in the junior heifer class. Select Fern, another Hultine entry, was first in the junior yearling class, and these three competed with the senior yearling heifer, Lily Brant 4th, of the Leemon Stock Farm, for junior championship honors, which were awarded to the latter.

Exhibitors—Achenbach Bros., Washington, Kan.; P. J. Fosse, St. Cloud, Minn.; Albert Hultine, Saronville, Neb.; Leemon Stock Farm, Hoopeston, Ill.; Purdue University, Lafayette, Ind.; W. W. Rose & Son, Rossville, Ind.; F. J. Schmeeckle, Cozad, Neb.; Frank Tossey, Marysville, Ohio. Judge: Earl E. Robbins, Horace, Ind.

Bull 3 years or over (3 shown)—1st Leemon Stock Farm on Scotch Loch Dale, 2d Fosse on Intense Sultan, 3d Tossey on Millcreek Prince 2d P. D.; 2 years and under 3 (3 shown)—1st Hultine on Roselawn Marshall; 2d Fosse on Heir Apparent, 3d Leemon Stock Farm on Loch Lindale; senior yearling (4 shown)—1st Rose & Sons on Royal Marshall, 2d Leemon Stock Farm on Snowball, 3d Hultine on Royal Goods, 4th Achenbach Bros. on Sunny Sultan; junior yearling (2 shown)—1st Fosse on Ashburn Sultan, 2d Hultine on Double Goods; senior bull calf (4 shown)—1st Rose & Sons on Proud Marshall; 2d Hultine on Christmas Goods, 3d Achenbach Bros. on Imperial Cumberland, 4th Leemon Stock Farm on Lee Dale Cumberland; junior calf (6 shown)—1st Rose & Sons on Royal Sultan, 2d Leemon Stock Farm on Lavender Dale, 3d Hultine on Gloster Goods, 4th Rose & Sons on Sultan's Perfection, 5th Leemon Stock Farm on Lee Dale.

Cow 3 years or over—1st Achenbach Bros. on Sultana, 2d Hultine on Winsome, 3d Leemon Stock Farm on Lancaster Maid 9th, 4th Leemon Stock Farm on Millcreek Duchess 4th, 5th Tossey on Millcreek Duchess 2d; 2 years and under 3 (6 shown)—1st Leemon Stock Farm on Princess Sultana, 2d Hultine on Siren 2d, 3d Leemon Stock Farm on Loch Dale's Violet, 4th Achenbach Bros. on Sultana Frances, 5th Fosse on Lady Dorothy; senior yearling (7 shown)—1st Leemon Stock Farm on Lily Brant 4th, 2d Leemon Stock Farm on Scottish Belle 15th, 3d Rose & Sons on Meadow Victoria, 4th Rose & Sons on Crimson Scarlet; junior yearling (7 shown)—1st Hultine on Select Fern, 2d Leemon Stock Farm on Lee Dale Mayflower, 3d same on Lee Dale Sultana, 4th Achenbach Bros. on Sultana Tarankful; senior calf (6 shown), 1st Hultine on Gloster Countess 2d, 2d Leemon Stock Farm on Lee Dale Sultana B., 3d Rose & Sons on Sultan's Rosemary; junior calf (7 shown), 1st Leemon Stock Farm on Lee Dale Mayflower C., 2d Hultine on

ACME WORM BOUNCER

the *guaranteed worm expeller, conditioner and tonic,* so manufactured—the proportions being just right—it is fed in Self Feeders, furnished FREE, and the hogs and sheep feed themselves, EAT AS THE SYSTEM REQUIRES. The weak, *unthrifty* pigs get their share, eat what they need, PREVENTS RUNTS, which is not possible otherwise. 40 hogs eat 1 pound per day, 150 pounds feeds 50 hogs 4 months, at 6c per month each. We guarantee this. **It is worth more than 6c per month to you** to expel the free intestinal worms, prevent worms, **indigestion, constipation and 90 percent of hog disease.**

Geo. H. Simpson, Sole Owner and Maker of "The Acme Line," Wheaton, Ill.

THIS FEEDER FREE

No chore, no mixing—they feed themselves ACME WORM BOUNCER.

O. W. Ricks, New Lisbon, Indiana, writes: "Pigs like ACME PIG MEAL fine, did well on it, ship 4,000 lbs. more."

L. B. Woods, North Bend, Nebraska, Duroc Breeder, says: "ACME PIG MEAL is great." November 21st ordered 1,000 lbs. more.

Fred Larson, Buffalo Center, Iowa, Poland Breeder, says: "ACME PIG MEAL is the best feed used for pigs." Ordered 2,000 lbs. more.

Acme Pig Meal

Equal to Milk. Protein 28½%.

Is a *full* and complete *ration,* nothing else is fed with it. You know how pigs do fed *milk*—that is how pigs do fed **Acme Pig Meal,** equal to milk. Start when the pigs will eat, it so takes the place of milk they will wean themselves at 8 weeks of age, prevents runts, setbacks, and retains the *baby pig fat.* 15 pounds makes 15 gallons *"milk equal,"* enough for one pig 30 days for 65c. A balanced and complete ration until 4 months of age. 25% cheaper than any other.

500 pounds.....$4.40 per hundred
1000 pounds..... 4.35 per hundred
2000 pounds..... 4.30 per hundred

TERMS: THIRTY DAYS

Made on the Farm—Made by a Farmer

During the years Acme Worm Bouncer has been sold, I do not know of a single user **who lost his hogs with Cholera, who fed Acme Worm Bouncer for 30 days and continued to feed it.**

John W. Hunt, Buckingham, Ill., writes: "ACME WORM BOUNCER expelled worms from my fall pigs 8 inches long." This is the remedy all hog raisers want, as it does the business.

W. R. Hanna, Harvey, Iowa, Hampshire Breeder, fed ACME WORM BOUNCER 3 years and ordered 500 pounds more in Oct. and says: "Ship me 2,000 lbs. ACME PIG MEAL, it is the best PIG FEED I know of."

You cannot afford to feed worms which breed cholera when ACME WORM BOUNCER prevents those conditions for 6c per month.

ACME WORM BOUNCER in 500 pound lots, $12.50, 90 days' time.

60-DAY GUARANTEE FEED. SEND THIS COUPON

Acme Manufacturing Company, Dept. L-12
Makers of Acme Worm Bouncer, Acme Pig Meal, Acme Calf Meal.
Wheaton, Illinois.

Gentlemen:—Ship me 150 lbs. of Acme Worm Bouncer with one Self Feeder FREE: Price $14.00. I will pay the freight. If Acme Worm Bouncer fails to do what you claim for it within 60 days from date of shipment, I will send you a certified statement which will cancel your charge for what I have fed. The balance I will return to your order. Otherwise I will pay for it 90 days from date of shipment.

FAT CATTLE.

The fat stock show, including cattle, hogs and sheep, was by far the largest that has ever been held at the International. The single classes of fat steers were unusually strong and interesting. In the Short-horn classes Sultan Selin, a senior yearling owned by the Purdue University, received the championship. He won over the two-year-old Merry Monarch, also owned by the Purdue University, which later became the grand champion of the show. This is an unusual occurrence and was due probably to the fact that Mr. Dryden, of Ontario, judged the pure-bred steers and Mr. Robson, of Ontario, the final championships. In the Hereford class Standard Lad 4th, a senior yearling owned by the University of Missouri, won the championship. In the Angus class Muscogee, a two year old, was made champion. This steer was owned and shown by Mr. Kershaw. In the Galloway class Bonnie Lad, a two year old owned by the University of Nebraska, won the champion, and in the grades and cross breds Liberty Bond, a senior calf owned by Mr. Yost, of Kansas City, won the championship ribbon. In the Red Polls Rudolph, a yearling shown by the University of Nebraska, became the champion. And in the Polled Durham class Kilmore Victor 10th, a yearling owned by the Purdue University, was the champion. In the champions of all ages Merry Monarch, the Purdue two year old, won. In the yearlings of this same class Fyvie Prince, a senior yearling Angus steer, stood first, and among the calves of this class Liberty Bond, the senior cross-bred calf of Yost, stood first. In the final contest for grand champion Yost's cross-bred calf was a very close contender for highest honors, but the judge finally decided to give it to Merry Monarch. It will be seen from the above that Purdue University won a great many prizes in the fat classes. And it is interesting to mention in this connection that the grand champion steer, the first senior yearling Short-horn, the first senior calf and the first junior calf were all sired by Lavender Sultan. We know of no sire that has had so many prize winners in the same show at Chicago in one year. It was a mighty fine lesson in prepotency.

The grand champion steer weighed 1,610 pounds and sold at auction for $2.10 per pound. In other words, he brought $3,381. He sold twice; was first purchased by the American Short-horn Breeders' Association for $2.05 and was then resold for the benefit of the Red Cross to Armour & Co. for $2.10. The carload lots of steers were quite up to the standard. In fact, it was generally conceded that the grand champion load, which was shown by E. P. Hall, of Mechanicsburg, Ill., was the finest finished load of cattle ever seen at the International. This makes the fourth time that Mr. Hall has won the grand championship in carload lots. This load was sold at auction for the phenomenal price of $42.50 per hundredweight and the steers averaged 1,090 pounds. Thirty-six loads of fat cattle sold for an average of $18.22 per hundredweight. The range was from $14 to $42.50, and the bulk sold at $16 to $18 per hundredweight. The general market was off the day of the sale, which accounts for the comparatively low average for International show cattle as compared with former years. The carload feeder show was a very fine one from a quality standpoint, but it was rather small. Eight loads of feeders sold at auction for an average of $11.83 per hundredweight, and the champion load brought $13.95. Twenty carloads of show hogs sold for an average of $16.90 per hundredweight and the champion load brought $21.25. The thirty-three car lots of show sheep ranged in price from $14.25 to $22 per cwt., the latter being paid for the champion load. There were more entries for the slaughter tests in cattle, hogs and sheep than usual. The Iowa State College won first honors in the steer competition on a pure-bred Angus calf weighing $1,185 pounds and which dressed 66.58 per cent. In the hog slaughter tests first was awarded to F. E. Bond, of Ava, Ill., on a cross-bred Berkshire-Chester White-Poland China barrow that weighed 200 pounds and dressed 84 per cent. The highest dressed lamb in this contest was furnished by Heart's Delight Farm, of New York. This lamb weighed 82 pounds and dressed 57.3 per cent and sold at auction for the exceedingly high price of 77½ cents a pound. There were twenty-two steers, forty-one hogs and forty-three sheep in the various slaughter contests. Following are the awards:

Fat Short-horns.

Exhibitors—Day & Rothrock, Spokane, Wash.; Theodore Fricke, State Center, Ia.; Wm. Herkelman, Elwood, Ia.; Iowa State College, Ames, Ia.; Eben E. Jones, Rockland, Wis.; Kansas State Agricultural College, Manhattan, Kan.; Lespedeza Farm, Hickory Valley, Tenn.; J. W. McDermott, Kahoka, Mo.; Findley McMartin & Sons, Claremont, Minn.; Ohio State University, Columbus, Ohio; Oklahoma A. & M. College, Stillwater, Okla.; Pennsylvania State College, State College, Pa.; Purdue University, Lafayette, Ind.; Reynolds Bros., Lodi, Wis.; Silver Brook Farm, Inc., Muncie, Ind.; Clifford Tague, Kirkman, Ia.; University of Illinois, Urbana, Ill.; University of Minnesota, St. Paul, Minn.; University of Missouri, Columbia, Mo.; University of Nebraska, Lincoln, Neb. Judge: W. A. Dryden, Brooklyn, Ont.

The awards follow: Steer, calved between Jan. 1, 1915, and Sept. 1, 1915 (11 shown), 1st Purdue University on Merry Monarch, 2d Purdue University on Bapton Buddie, 3d Reynolds Bros. on White Velvet, 4th Oklahoma Agricultural College on Bennie Dale, 5th Kansas State Agricultural College on Archer Dale, 6th and 7th Russell on Downsview Lad and Stubby Rex, 8th Ohio State University on Ohio's Nabol; senior yearling (9 shown), 1st Purdue University on Sultan Selim, 2d Russell on Clear the Way, 3d Reynolds Bros. on Lightning Flash, 4th Kansas State Agricultural College on Barmpton Prince, 5th University of Illinois on Ace of Diamonds; 6th Lespedeza Farm on Charley, 7th University of Illinois on Major Goods, 8th Iowa State College on Royal Choice; junior yearling (11 shown), 1st Purdue University on Warden, 2d Kansas State Agricultural College on Gulnare Dale, 3d Silver Brook Farm on Tommy, 4th Ohio State University on Ohio's Lavender Lad, 5th University of Missouri on Choice Dale, 6th Herkelman on Pete Cumberland, 7th Oklahoma A. & M. College on Barmpton's Choice, 8th University of Illinois on Illini Goldie's Pride; senior calf (16 shown), 1st Purdue University on New Year's Sultan, 2d Day & Rothrock on Hercules, 3d Russell on Shorty, 4th Purdue University on Merry Chimes, 5th University of Illinois on Illini Model 2d, 6th Kansas State Agricultural College on Golden Dale 2d, 7th Reynolds Bros. on Roan King, 8th University of Illinois on Illini Sultan; junior calf (9 shown), 1st Purdue University on New Year's Sultan, 2d Reynolds Bros. on Volunteer, 3d Iowa State College on Marmion, 4th Jones on Hillshade Laddie, 5th Russell on Martin, 6th University of Minnesota on North Star, 7th Ohio State University on Ohio's Pride, 8th University of Nebraska on Snowball.

Champion steer, Purdue University on Sultan Selim; herd of three head (8 shown), 1st and 2d Purdue University, 3d Russell, 4th Reynolds Bros., 5th Kansas State Agricultural College.

Fat Aberdeen Angus.

Exhibitors—Ames Plantation, Grand Junction, Tenn.; C. D. & E. F. Caldwell, Burlington Junction, Mo.; J. S. Caldwell & Sons, Chillicothe, Ohio; A. S. THE HORSE SHOW.

Percherons.—A better lot of Percherons has never been shown at the International than was shown this year. Last year there were a greater number of entries and the showing set a new standard of Percheron excellence and supremacy, but from the standpoint of uniformity and quality the 1917 showing has surpassed all previous attainments. This is indeed

Be "U. S. Protected" For Winter Barnyard Tasks

WHEN the ground is shrouded in deep snow and the thaws bring ankle-deep, oozy mixtures of mud and slush, keep your feet warm, dry and comfortable in U. S. Rubber Footwear.

Built for heavy service, double duty, this rubber footwear is impregnable to assaults of wet and cold—made to defy storm, sloughs and snags. Not only does greater comfort make this footwear most desirable, but sturdiness and long wear mean money saved.

Every pair bears the U. S. Seal—the trade mark of the largest rubber manufacturer in the world. *Look for this seal—it is your protection.* "U. S." is for sale everywhere. Your dealer has the style you want or can get it for you.

United States Rubber Company
New York

U. S. Rubber Footwear

gratifying to know at a time when the horse business is seriously affected by the high prices of feed and labor. It has been reported that the breeding of mares has fallen off approximately 25 per cent this year due to the acute feed and labor shortage met with in the horse business. But in spite of this unsatisfactory outlook the Percheron business has held its own, if this year's record at the International may be taken as an indication. Of special interest is the fact that a surprisingly large number of the entries were American bred. The female classes brought forth the best exhibits of American-bred mares that have ever been in the show ring, and the excellence of the lot clearly indicates what American breeders can do when they set about their task without upon imported stock. Another significant feature is that the first-prize aged stallion, Philix, of the Singmaster stables, is American bred, while practically all his contestants are imported. After standing first in his class he met and defeated the blue ribbon winners of all other classes, thus winning the senior and grand championship trophies of the show. His closest competitor was Negro, an imported four year old from the Crouch stables, that won the reserve championship in both the senior and grand classifications.

The foremost female of the show was Turquoise, a stylish three year old owned by Dunhams. She easily stood first in her class and later won out in the contest for senior and grand champion mare, although the aged mare, Magicienne, of Vance & Krepps, gave her a sharp battle for the championship trophies. An interesting part of the Percheron show this year was the moving picture film called "Percherons in Peace and War," which was exhibited at the Percheron banquet. This two-reel film shows in story form the usefulness of the Percheron horse on the farm, in the city and in connection with this country's war operations. The film has been released for the free use of farmers' institutes and may be obtained for use by any organization interested in the horse business upon application to the secretary of the Percheron society.

Belgians.—Belgian popularity has made rapid progress in the last few years. This fact has been clearly demonstrated in the show ring, not only by the interest taken in the exhibits and judging of the various classes, but also in the noticeable improvement in quality of the breed. Last year was a record breaker for the Belgians at the International, but the showing this year at least tied that of 1916 and possibly surpassed it. It was a splendid showing throughout, all classes being well filled with real show animals and lacking the usual discards at the end of the line. The only class which was not well represented was that of four-year-old stallions, where only three entries were made, but the quality here more than made up for the scarcity in numbers. Irvinedale Rowdy, the superb sorrel stallion of the Irvine Farms, came in this class and proved himself a winner not only here, but in the sweepstakes, where he became senior and grand champion stallion of the show. Reavedore, a three year old recently sold to Lefebure & Sons by Frank P. Shekleton & Sons, of Lawler, Iowa, was a close competitor of the Irvine stallion, but the judges finally placed him as the reserve, both in the senior and grand sweepstakes. The junior champion was Lefebure's Duke of Elmwood, a two year old of great size and type, but lacking in the wonderful conformation and action of the senior champion. In the senior and grand female sweepstakes Irvine again came to the front, winning both first place and reservie on Lista and Salome. Paramount Lulu, an unusually promising yearling, was made junior female champion, and was well worthy of the place, although she was not a close competitor of the senior champion. While the judging took a great deal of time, in general the awards were very satisfactory. The work was done by a committee of three men, consisting of Eli Springer, Saginaw, Mich.; Harry McNair, U. S. Yards, Chicago, Ill.; W. H. Pew, Ames, Iowa.

Yearling futurity stallion, 1st Fox on John De Bois, 2d, 4th and 6th Lefebure & Sons on Clairon du Balcon, Fairfax Jean and Fairfax Major, 3d Good on Ruban, 5th and 10th Finch on Bruno de Cambron and Bruno Radiense, 7th Etchison on Bonaparte J. R., 8th Bell Bros. on Delos, 9th Tucker on Mack Houston.

Yearling futurity mare, 1st, 4th, 5th and 9th Good on Paramount Lulu, Princess B., Paramount Selma and Oakdale Girl, 2d and 3d Ulmer on Loudena and Lauretta, 6th Stamp on Julie, 7th Irvine on Jupiter's Lillie, 8th Silverthorn on Louisane 2d, 10th Blue on Pauline.

Shires.—Shires were entirely up to standard this year at the International. The representation was very good, although the number of entries in this breed are never very large at Chicago. Quality and uniformity were evident throughout the showing, and there was a higher percentage of high-class animals shown than is found as a rule where the classes are much larger. Three judges handled the work of tying the ribbons and compared with the usual committee judging, their work was unusually rapid. Among the outstanding animals, Boro Blue Sterer, of the Hawthorn Farm, pushed to the front as senior and grand champion stallion of the breed. He is a large, well-finished stallion and a very straight mover, which had considerable to do with his winning over the junior champion, Royal Edward Albert, a yearling from the McCray & Fowler stables. Eureka Pearl, an American-bred three-year-old mare owned by Hawthorn Farm, stood out in the female sweepstakes as senior and grand champion. Her long, deep body and good feet and legs were noteworthy points in her favor. Among the females as well as in the stallion classes a McCray & Fowler entry came in for junior championship, the award going to Royal Bonny, a finely-formed two year old of splendid Shire type and finish.

Exhibitors—Chas. Cappel, Logansport, Ind.; Fred Chandler, Chariton, Ia.; R. Connor Co., Marshfield, Wis.; Finch Bros., Fargo, N. D.; Finch Bros., Joliet, Ill.; Hawthorn Farm, Lake County, Ill.; F. A. Huddlestun, Webster City, Ia.; S. Metz & Sons, Homewood, Ill.; Meyer Bros., Wadsworth, Ill.; J. C. Moore, Rushville, Ill.; McCray & Fowler, Fithian, Ill.; A. G. Soderberg, Osco, Ill.; Union Stockyards & Transit Co., Chicago, Ill.; E. W. Walker & Sons, Mazon, Ill. Judges: William Bell, Wooster, Ohio; C. F. Curtiss, Ames, Iowa; Alex Galbraith, Edmonton, Alta.

Futurities—Yearling stallion, 1st and 4th McCray & Fowler on Royal Edward Albert and Fearless Eldorado, 2d Hawthorn Farm on Hawthorn Bucherer, 3d Soderberg on Osco King, 5th and 9th Moore on Jack Johnson and Victor Blaze, 6th and 10th Cappel on Excelsior and Cappel's Topsman, 7th and 8th McCray & Fowler on Blythwood Mc and Blythwood E.; yearling mare, 1st, 3d and 5th Hawthorn Farm on Ceylon Court Pride, Diamond Surprise and Ceylon Court Primrose; 2d and 7th Moore on Cappel's Narcissus and Moore's Wild Rose, 4th Cappel on Cappel's Sunshine Lady, 6th McCray & Fowler on Basinghall Bonny.

Clydesdales.—The East fought against the Middle West in the Clydesdale contest of the International and the final outcome was practically a draw between the two sections. In numbers the show was about the same as it was last year, but the general quality probably not so good throughout all the classes. In the classes of fillies it was decidedly better; some of the young stuff shown could not be beaten anywhere, but the stallion classes fell down to some extent. R. B. Ogilvie, one of the superintendents of the show, declared that the classes of fillies were some of the best he had ever seen in his experience with the breed. As may be expected in a show of this kind, the champions were strikingly outstanding in both the stallion and mare divisions. No grand champion ribons were tied, since the classifications did not bring the junior and senior champions into competition. Among the outstanding champions deserving special mention were Diamond, a big, powerful four-year-old stallion, owned by Cluett, of Williamstown, Mass., who carried off the purple for senior champion stallion, and Madame Butterfly, a classy three-year-old mare, owned by Edellyn Farms, of Waukegan, Ill., which became senior champion mare.

Exhibitors—Bedminster Farms, Far Hills, N. J.; Blythewood Farm, Pittsfield, Mass.; Geo. A. Cluett, Williamstown, Mass.; Conyngham Bros., Wilkes-Barre, Pa.; Edellyn Farms, Waukegan, Ill.; Fairholme Farm, New Market, N. J.; Finch Bros., Fargo, N. D.; H. Harris Ford, Storm Lake, Ia.; J. W. Garrard, Delphia, Ind.; W. L. Houser, Mondovi, Wis.; Eben A. Jones, Bangor, Wis.; Kansas State Agricultural College, Manhattan, Kan.; James Kennedy, Utica, Ill.; C. W. Lindgren, Ida Grove, Ia.; Leach & Son, Lafayette, Ill.; McLay Bros., Janesville, Wis.; G. W. Merna, Wyoming, Ill.; S Metz & Son, Homewood, Ill; Ohio State University, Columbus, Ohio; Painter Bros., Middletown, Ind.; J. P. Peterson, Herman, Neb.; A. G. Soderberg, Osco, Ill.; South Bros., Orion, Ill.; L. C. Tice, Sully, Ia.; University of Minnesota, St. Paul, Minn.; University of Wisconsin, Madison, Wis.; Geo. P. Williams, Princeton, Ill.; Otha Wyrick, Kempton, Ind. Judges. Andrew McFarlane, Palo, Ia.; George Hutton, Madison, Wis.; Wm. Grant, Regina, Sask.

Aged stallion (6 shown), 1st Cluett on Diamond, 2d Leitch & Son on Milkado, 3d Merna on Samuda, 4th South Bros. on General Davidson, 5th Bedminster Farms on Baron of Bedminster, 6th Samuelson on Wilson; 3 years and under 4 (6 shown), 1st Bedminster Farms on Woodburn King of Bedminster, 2d Fairholme Farms on Golden Chief, 3d Ford on Prince Ulysses, 4th Blythewood Farms on Baron Blythewood, 5th Houser on Badger King, 6th Painter Bros. on Prince Reo; 2 years and under 3 (10 shown), 1st Edellyn Farms on Solid Silver, 2d Lindgren on King Albert 2d, 3d Jones on Trooper's Baron, 4th Conyngham Bros. on Scottish Knight, 5th Blythewood Farms on Blythewood Favorite, 6th Cluett on Heatherbloom; 1 year and under 2 (16 shown), 1st Ford on Proud Archer, 2d and 3d Bedminster Farms on King's Last of Bedminster and King's Best of Bedminster, 4th Leitch & Son on Baron Ashvale 2d, 5th McLay Bros. on King's Messenger, 6th Soderberg on Johnathan, 7th and 8th Conyngham Bros. on Lord Kitchener and Hillside Prince; foal (10 shown), 1st Soderberg on unnamed, 2d and 4th Houser on Peerless Fortune and Perfect Fortune, 3d McLay Bros. on Caruso, 5th Leitch & Son on Ashvale Premier, 6th Peterson on Highland Pride.

Mare 4 years and over (9 shown), 1st McLay Bros., on Bucklyvie Lady, 2d Cluett on Lady Lister, 3d University Farm on Minnesota Prince, 4th South Bros. on Beauty's Maid, 5th and 6th Painter Bros on Adora and Lady Evergreen; 3 years and under 4 (11 shown), 1st Edellyn Farms on Madame Butterfly, 2d Cluett on Osceola Queen, 3d Conyngham Bros. on Hayfield Evangeline, 4th Jones on Sweet Marie, 5th McLay Bros. on King's Baroness, 6th Peterson on Eastlawn's Flash 2d; 2 years and under 3 (5 shown), 1st Cluett on Osceola Duchess, 2d and 3d Edellyn Farms on Flora of Claremont and Ladies' Maid, 4th Conyngham Bros. on Hillside Nora, 5th Leitch & Son on Swift of Avondale; 1 year and under 2 (17 shown), 1st Edellyn Farms on Merlin Princess, 2d Tice on Bonita, 3d Cluett on Favorite Maid, 4th Blythewood Farm on Blythemaid 2d, 5th Conyngham Bros. on Hillside Pearl, 6th Soderberg on Winsome's Favorite; foal (8 shown), 1st Cluett on Portia, 2d and 5th Houser on Lady Footprint and Periwinkle, 3d McLay Bros. on Buckler's Gem, 4th Edellyn Farms on Edellyn Baroness, 6th Jones on Trooper's Beauty.

Stallion and 3 mares, American bred (7 shown), 1st Cluett, 2d Conyngham Bros.; 3d McLay Bros., 4th Houser, 5th Leitch & Son; 3 get of 1 sire, American bred (7 shown), 1st Cluett, 2d Bedminster Farms, 3d Conyngham Bros.; 4th Jones, 5th Soderberg; 2 produce of 1 dam, American bred (7 shown), 1st Cluett, 2d Bedminster Farms, 3d Jones, 4th McLay Bros., 5th Peterson.

Senior champion stallion, Cluett on Diamond, reserve, Leitch & Son on Milkado; junior champion stallion, Edellyn Farms on Solid Silver, reserve, Ford on Proud Archer; senior champion mare, Edellyn Farms on Madame Butterfly, reserve, McLay Bros. on Bucklyvie Lady; junior champion mare, Cluett on Osceola Duchess, reserve, Edellyn Farms on Merlin Princess; champion stallion bred in the United States, Ford on Proud Archer, reserve, Bedminster Farms on Woodburn King of Bedminster; champion mare bred in the United States, Cluett on Osceola Duchess, reserve, McLay Bros. on Bucklyvie Lady.

THE SWINE SHOW.

Chester Whites.—The larger part of the Chester White showing at the International was made up of two herds, one from Michigan and the other from Iowa, while three additional exhibitors made a few scattered entries. Taken as a whole, the show was not so strong as it should have been, although there were some outstanding individuals shown. Judge W. A. Hoover, of Iowa City, Iowa, did not have a very difficult task in the open classes, but it was a different proposition when he came to the championships. In the contest for senior champion boar the points were extremely close between the aged boar, Rival, owned by Adams Bros., Litchfield, Mass., and Investor, the senior yearling boar of Alden Anderson, of Story City, Iowa. The Anderson boar finally won out because of his greater smoothness and finish, although the aged boar had good quality combined with wonderful size and stretch. The senior champion later became grand champion. Anderson also won the junior champion trophy on his senior boar pig, Anxiety 3d. In the female sweepstakes, F. E. Bone, Ava, Ill., captured the senior and grand purples on his aged sow, Mina Dean, an animal of unusual width, scale and finish. In her hams and shoulders she was especially well developed. The junior champion of the Anderson herd gave her a close race for the grand championship, but in spite of her good promise for a pig she was not able to snatch away the trophy.

Exhibitors—Adams Bros., Litchfield, Mass.; Alden Anderson, Story City, Iowa; J. K. Milner, Thorntown, Ind.; F. E. Bone, Ava, Ill.; J. E. McCoy, Warsaw, Ind. Judge: J. W. Brendel, Zionville, Ind.

Boar 2 years or over, 1st Adams Bros. on Rival; 18 months and under 24 (2 shown), 1st Anderson on Investor, 2d Adams Bros. on Dolly Boy; 12 months and under 18 (2 shown), 1st Anderson on Chief's Big Bone, 2d Adams Bros. on Select Boy; 6 months and under 12 (3 shown), 1st Anderson on Anxiety 3d, 2d Adams Bros. on Winning Chief, 3d Milner on Silver Coin Jr.; under 6 months (5 shown), 1st Anderson on Chief's Booster, 2d Adams Bros. on A. J.'s Best, 3d Milner on unnamed, 4th Bone on Success, 5th McCoy on unnamed.

Sow 2 years or over (3 shown), 1st Bone on Mina Dean, 2d and 4th Anderson on Magdalene and Priceless, 3d Adams Bros. on Winning Girl 1st; 18 months and under 24 (3 shown), 1st and 2d Anderson on Miss Chief and Royal Gem, 3d Adams Bros. on Choice Girl; 12 months and under 18 (3 shown), 1st and 2d Anderson on Hawkeye Belle and Hawkeye Belle 2d, 3d Adams on Quality Girl; 6 months and under 12 (3 shown), 1st and 2d Anderson on Smooth Maid and Smooth Maid 2d, 3d Adams Bros. on Winning Lady; under 6 months (7 shown), 1st and 4th Anderson on Orange Best and Orange Best 2d, 2d and 5th Milner on Lady B. 2d and Lady B. 3d, 3d Bone on Mina.

Boar and 3 sows over 1 year (3 shown), 1st and 2d Anderson, 3d Adams Bros.; boar and 3 sows over 1 year bred by exhibitor (2 shown), 1st Anderson, 2d Adams Bros.; boar and 3 sows under 1 year (3 shown), 1st Anderson, 2d Milner, 3d Adams Bros.; boar and 3 shows under 1 year bred by exhibitor (3 shown), 1st Anderson, 2d Milner, 3d Adams Bros.; 4 pigs under 6 months, produce of same sow (4 shown), 1st Bone, 2d Milner, 3d Anderson, 4th Adams Bros; 4 swine, get of same boar, bred by exhibitor (5 shown), 1st and 4th Anderson, 2d Bone, 3d Milner, 5th Adams Bros.

Senior and grand champion boar, Anderson on Investor; junior champion boar, Anderson on Anxiety 3d; senior and grand champion sow, Bone on Mina Dean; junior champion sow, Anderson on Smooth Maid.

Duroc Jerseys.—Although the Duroc Jersey show at the International was not large, there was a noticeable improvement in the quality of the animals shown. For several years the red hogs have been advancing toward a larger bigger-boned type, with plenty of stretch. This type has been found to be the most profitable for pork production and it is gratifying to note the success with which breeders are realizing this type. Ira Jackson, of Tippecanoe City, Ohio, carried away the greatest number of ribbons just as he did last year. Several breeders expressed the opinion that his exhibit of Duroc sows could not be surpassed anywhere. His young boars also made a very strong showing. Orion Cherry King 17th, his senior boar pig, became junior champion boar and pushed the senior champion, Economy 2d, owned by Browning of Hersman, Ill., very hard for the grand championship. But the judge, W. T. Harris, of Morgantown, Ky., finally decided in favor of the senior boar. Jackson took all the female championships without much strong competition. In general the quality of the Duroc showing was greater than was expected.

Exhibitors—H. E. Browning, Hersman, Ill.; J. Young Caldwell, Williamsville, Ill.; A. F. Hughes, Sherman, Ill.; Ira Jackson, Tippecanoe City, Ohio; Henry W. Matern, Lostant, Ill.; Mayfield Farm, Lexington, Ky.; Pennsylvania State College, State College, Pa.; L. L. Shultz, Oxford, Ohio; W. E. Spicer, Bushnell, Ill. Judge: W. T. Harris Morgantown, Ky.

Aged boar (3 shown), 1st Browning on Economy 2d, 2d Matern on Financial King, 3d Schultz on Garnet Colonel's Defender; 18 months and under 24 (2 shown), 1st Jackson on Orion Cherry King 11th, 2d Mayfield Farm on Peerless Imperator Jr.; 12 months and under 18 (4 shown), 1st Caldwell on Aleniator, 2d Spicer on Orion Chief 16th, 3d and 4th Shultz on Brilliant Sensation and Brilliant Defender; 6 months and under 12 (4 shown), 1st Jackson on Orion Cherry King 17th, 2d Mayfield Farm on Imperator's Volunteer, 3d Hughes on Chief of Sangamo 2d, 4th Caldwell on Valley Prince; under 6 months (8 shown), 1st Hughes on Choice Colonel of Sangamo 2d, 2d Jackson, 3d and 4th Mayfield Farm on Imperator's Intruder, 5th Schultz on Pride of Defender 8th.

Aged sow (5 shown), 1st and 4th Mayfield Farm on Cherry King Irene and Mayfield Orion Lady A. 3d, 2d Jackson on King Lady 13th, 3d and 5th Caldwell on Highland Willetta 1st and Golden Glow 4th; 18 months and under 24 (3 shown), 1st Jackson on Orion Willetta 3d, 2d Mayfield Farm on Taxpayer's Gem, 3d Hughes on Top Beauty; 12 month and under 18 (6 shown), 1st Jackson on Joe's Orion Nellie 5th, 2d and 4th Mayfield Farm on Palo Fancy Finish and Mayfield's Imperator Orion, 3d Pennsylvania State College, 5th Caldwell on Ophelia; 6 months and under 12 (9 shown), 1st and 2d Jackson on Joe's Orion Lady 9th and Joe's Orion Lady 10th, 3d and 5th Mayfield Farm on Mayfield Luella and Pal's Wonder Belvie, 4th Hughes on Chief of Sangamo 4th; under 6 months (5 shown), 1st

BETTER CATTLE

Get full service from your cattle. Lameness, scouring, sore udders and kindred ailments reduce their usefulness and fruitfulness.

Use Sloan's Liniment; easily applied and quickly effective. It penetrates at once.

You will find many uses for this fine remedy in the home as well as in the barnyard. Always have it handy.

Buy it at your druggists. 25c 50c $1.00

The 18 oz. $1.00 bottle contains six times the 25c size.

and 2d Jackson on unnamed, 3d Shultz on unnamed, 4th and 5th Hughes on Chief of Sangamo 7th and Chief of Sangamo 8th.

Boar and 3 sows over 1 year (3 shown), 1st Jackson, 2d Mayfield Farm, 3d Caldwell; boar and 3 sows over 1 year, bred by exhibitor (2 shown), 1st Jackson, 2d Caldwell; boar and 3 sows under 1 year (5 shown), 1st Jackson, 2d Mayfield Farm, 3d Hughes, 4th Caldwell, 5th Shultz; boar and 3 sows under 1 year, bred by exhibitor (4 shown), 1st Jackson, 2d and 3d Hughes, 4th Shultz; 4 pigs under 6 months produce of 1 sow (2 shown), 1st Jackson, 2d Hughes; 4 pigs, get of 1 boar, bred by exhibitor (4 shown), 1st and 2d Jackson, 3d Hughes, 4th Shultz.

Senior and grand champion boar, Browning on Economy 2d; junior champion boar, Jackson on Orion Cherry King 17th; senior and grand champion sow, Jackson on Orion Willetta 3d; junior champion sow, Jackson on Joe's Orion Lady 9th.

Hampshires.—Outstanding quality was the most prominent feature of the Hampshire show at the International. In number the show was hardly up to normal, but the uniformity of the showing and the closeness of the contest made up for the deficiency in this respect. Two exhibitors with complete herds made up most of the showing and there were only two other breeders, each with but a few entries, who took part. Chas. Marker, Auburn, Ill., judge of the breed, completed his task with no great difficulty and his decisions met with popular approval. He selected the Wickfield boar, Captain Silko, a large, well-proportioned animal, for senior and grand champion boar, and Vena 2d, a senior yearling owned by Lewis, for senior and grand champion sow. The principal contestants divided honors equally in the championships, Wickfield Farm winning all the boar sweepstakes and Lewis all the female purple ribbons.

Exhibitors—John R. Lewis, Renssalaer, Ind.; Wickfield Farm, Cantril, Ia.; Col. John S. Cooper, Gilbert, Ill.; Simon Albricht, Tiskilwa, Ill. Judge: Chas. Marker, Auburn, Ill.

Boar 2 years or over (2 shown), 1st Wickfield Farm on Captain Silko, 2d Lewis on Pacific; 18 months and under 24 (1 shown), Lewis on Iowa Boy; 12 months and under 18 (2 shown), 1st and 2d Lewis on Boulder's Duke and Renssalaer Duke; 6 months and under 12 (4 shown), 1st and 3d Wickfield Farm on Defender 2d and Lookout Reminder, 2d Lewis on General's Best 1st, 4th Cooper on Cooper's Andy; under 6 months (3 shown), 1st and 2d Wickfield Farm on unnamed, 3d Albricht on Model Prince.

Sow 2 years or over (4 shown), 1st and 3d Lewis on King's Sister and Belvie, 2d Wickfield Farm on Polly Lookout, 4th Cooper on Community's Raechel Girl 1st; 18 months and under 24 (3 shown), 1st and 3d Lewis on Vena 2d and Lady Malloy, 2d Wickfield Farm on Lookout Girl; 12 months and under 18 (3 shown), 1st and 3d Lewis on Miss Duty and Belva D., 2d Wickfield Farm on Cherokee Pearl; 6 months and under 12 (5 shown), 1st and 2d Wickfield Farm on Birdie Lookout and Nellie Lookout, 3d and 5th Lewis on Elvira and unnamed, 4th Cooper on Cooper's Bessie; under 6 months (5 shown), 1st Lewis on Prattsville Maid, 2d and 4th Albricht on Kitty's Fancy and Lily 2d, 3d and 5th Wickfield Farm on unnamed.

Boar and 3 sows over 1 year (3 shown), 1st and 3d Lewis, 2d Wickfield Farm; boar and 3 sows over 1 year, bred by exhibitor (1 shown), Lewis; boar and 3 sows under 1 year (4 shown), 1st and 4th Wickfield Farm, 2d Lewis, 3d Albricht; boar and 3 sows under 1 year, bred by exhibitor (2 shown), 1st and 2d Wickfield Farm; four pigs under 6 months, produce of one sow (1 shown), Wickfield Farm; four pigs get of one boar, bred by exhibitor (2 shown), 1st Lewis, 2d Wickfield Farm.

Senior and grand champion boar, Wickfield Farm on Captain Silko; junior champion boar, Wickfield Farm on Defender 2d; senior and grand champion sow, Lewis on Vena 2d; junior champion sow, Lewis on Prattsville Maid.

Berkshires.—Special interest centered around the Berkshire at the International this year. Possibly the fact that the grand champion barrow of all breeds and also the grand champion pen of three barrows of all breeds were Berkshires aroused this interest. At any rate it was evident both in the judging of breeding and fat stock. Competition in all classes was unusually keen, considering the small number of exhibitors, and no one breeder was able to get very far ahead of his competitors in number of winnings. Eighty-two breeding animals were in the show and there were very few tailenders in the lot. Double's Majestic, from the Overlook Orchards, attracted considerable attention in his class because of his great stretch and splendid width and strength in the back. He finally came through the show with both the senior and grand champion boar purples. Another boar of interest was Rosicrucian Duke 67th, a senior pig owned by W. E. Spicer, of Bushnell, Ill. Although he lacked the finish of the senior boar, nevertheless he was a splendid animal, showing lots of promise. A big, stretchy sow, Successor's Lady 14th, of the Overlook Orchards, won the senior and grand championships in the female classes with little difficulty, although the junior champion, Rookwood Lady 133d, of the Hamilton Farms, was an unusually fine pig, lacking only the maturity of the senior champion.

Exhibitors—Blythewood Farm, Pittsfield, Mass.; Nelle Fabyan, Geneva, Ill.; Hamilton Farm, Gladstone, N. J.; Hood Farm, Lowell, Mass.; Jenkins Bros., Orleans, Ind.; Mooseheart, Mooseheart, Ill.; Overlook Orchards, Littleton, Mass.; W. E. Spicer, Bushnell, Ill.; Sutton Farm, Lawrence, Kan.; University of Ill., Urbana, Ill. Judges: L. E. Ortig, Bernardsville, N. J., and E. J. Barker, Thorntown, Ind.

Boar 2 years or over (2 shown), 1st Fabyan on King James, 2d University of Illinois on no name; 18 months and under 24 (3 shown), 1st Mooseheart on Mooseheart Rival's Masterpiece, 2d and 3d Fabyan on Riverbank Cyrano and Kingston of Riverbank; 12 months and under 18 (6 shown), 1st Overlook Orchards on Double's Majestic, 2d Hamilton's Superbe Fearnaught, 3d Fabyan on Kingdom of Riverbank, 4th Sutton Farm on Lee's Robinhood 2d, 5th Mooseheart on Double's Climax; 6 months and under 12 (3 shown), 1st Spicer on Romford Duke 67th, 2d Hamilton Farm on Hamilton's Leader, 3d Mooseheart on Rival's premier; under 6 months (5 shown), 1st Hamilton Farms on Hamilton Champion, 2d and 4th Jenkins Bros. on Superb's Assured and Superb's Invincible, 3d Sutton Farm on Robinhood's Successor, 5th Fabyan on no name.

Sow 2 years or over (5 shown), 1st and 3d Overlook Orchards on Successor's Lady 4th and Successor's Duchess 12th, 2d Fabyan on no name, 4th Mooseheart on Mooseheart's Rival Lassie, 5th Hamilton Farm on Matchless Belle 20th; 18 months and under 24 (4 shown), 1st Overlook Orchards on Successor's Lady 14th, 2d and 3d Hamilton Farm on Duchess 481 and Handsome Jewell, 4th Fabyan on King's Marchioness; 24 months and under 18 (7 shown), 1st Overlook Orchards on Longfellow's Double's Daughter, 2d and 3d Hamilton Farm on Champion's Empress 5th and Superb's Duchess 14th, 4th Fabyan on Queen of Riverbank, 5th Mooseheart on Mooseheart Premier Duchess; 6 months and under 12 (12 shown), 1st Jenkins Bros. on Superb Premier's Duchess, 2d Spicer on Romford 156th, 3d Overlook Orchards on Longfellow's Double's Bernice, 4th and 5th Blythewood Farm on no name; under 6 months (6 shown), 1st Hamilton Farm on Rookwood Lady 133d, 2d and 4th Sutton Farm on Lady Peaceful Robinhood and Robinhood's Peaceful Lee, 3d Mooseheart on Mooseheart's Rival's Duchess 5th, 5th Fabyan on Bicountess A of Riverbank.

Boar and 3 sows over 1 year (5 shown), 1st Overlook Orchards, 2d and 4th Mooseheart, 3d Fabyan, 5th Sutton Farm; boar and 3 sows over 1 year bred by exhibitor (4 shown), 1st and 2d Fabyan, 3d Mooseheart, 4th Sutton Farm; boar and 3 sows over 1 year (5 shown), 1st Spicer, 2d Overlook Orcards, 3d Fabyan, 4th Sutton Farm, 5th Mooseheart; boar and 3 sows under 1 year (5 shown), 1st Spicer, 2d and 5th Fabyan, 3d Sutton Farm, 4th Mooseheart; 4 swine get of same boar, bred by exhibitor (5 shown), 1st Hood Farm, 2d Spicer, 3d and 4th Fabyan, 5th Sutton Farm.

Senior and grand champion boar, Overlook Orchards on Double's Majestic; junior champion boar, Spicer on Romford Duke 67th; senior and grand champion sow, Overlook Orchards on Successor's Lady 14th; junior champion sow, Hamilton on Rookwood Lady 33d.

Poland Chinas.—G. L. Burgess & Son, Bement, Ill., exhibited the only herd of Poland Chinas at the International this year. The animals were well fitted for the show and possessed splendid breeding, consequently, Burgess & Son took the blue ribbon in every class in which they were able to make an entry.

FAT SWINE.

Fat swine at the International this year made a better showing both in numbers and quality than they did in 1916. The classes in the various breeds were larger and most of the animals were well finished in spite of the high price of feeds. Berkshires led in the number of entries and also succeeded in winning the highest trophies—those of grand champion barrow and grand champion pen of barrows of any age or breed. Hood Farm, Lowell, Mass., carried off both these prizes. In both cases the decisions met with popular approval, since the Hood Farm without doubt had a wonderful lot of superbly finished barrows. The reserve grand champion barrow was a Hampshire owned by Robert Runkle, of Littleton, Ill. It was a close second to the winner, but lacked the winner's great size and fitting. The trophy for reserve grand champion pen of barrows of any breed was awarded to Ohio State University on their pen of Durocs.

Exhibitors—Hood Farm, Lowell, Mass.; Iowa State College, Ames, Iowa; University of Illinois, Urbana, Ill.; University of Missouri, Columbia, Mo.; Iowana Farm, Davenport, Iowa; Ohio State University, Columbus, Ohio; U. S. Corsa, Whitehall, Ill.; Pennsylvania State College, State College, Pa.; Purdue University, Lafayette, Ind.; Sutton Farm, Lawrence, Kan.; G. L. Burgess, Bement, Ill.; University of Nebraska, Lincoln, Neb.; University of Minnesota, St. Paul, Minn.; Kansas State Agricultural College, Manhattan, Kan.; Ira Jackson, Tippecanoe City, Ohio; F. E. Bone, Ava, Ill.; Leonard Heisel & Son, Cedar Rapids, Ia.; J. K. Milner, Thorntown, Ind.; Bert Meyers, Rochester, Ind.; Robert C. Runkle, Littleton, Ill.; Wickfield Farms, Cantril, Ia.; Simon Albricht, Tiskilwa, Ill.; Raemelton Farm, Mansfield, Ohio.; Otto Schonboe, Harlan, Ia.

Judges—Berkshires: E. J. Barker, Thorntown, Ind.; Poland Chinas: J. M. Camp, Kenney, Ill.; Duroc Jerseys: W. T. Harris, Morganfield, Ky.; Hampshires and Chester Whites: Harry Booth, Union Stockyards, Chicago, Ill.; Yorkshires: D. A. Gaumnitz, South St. Paul, Minn.; Tamworths: T. G. Scheer, Bethany, Ill.; grade and cross breds and champions: W. L. Carlyle, Stillwater, Okla.

Fat Berkshires.—Barrow 18 months and under 24 (12 shown), 1st and 4th Hood Farm, 2d and 5th Iowa State College, 3d and 8th University of Missouri, 6th and 7th Iowana Farms; 12 months and under 18 (4 shown), 1st and 2d Iowana Farms, 3d and 4th University of Illinois; 6 months and under 12 (6 shown), 1st and 5th Hood Farm, 2d and 3d Corsa, 4th and 6th Iowana Farms; under 6 months (11 shown), 1st and 4th Purdue University, 2d and 3d Iowa State College, 5th Pennsylvania State College, 6th and 7th Hood Farm, 8th University of Illinois.

High Cow for October.

In this department this week The Wisconsin Farmer published a reproduction of a picture of a high cow in Wisconsin cow-testing associations for October. This cow is owned by E. G. Race, Winnebago county, Wisconsin, and her name is Gertrude Wayne Colantha Fayne. She is a pure-bred Holstein cow, six years old, and produced 86.7 pounds butter fat during October. A good look at the accompanying illustration will convince almost any dairyman that there is little chance for doubt about this record. It is evident that Gertrude Wayne Colantha Fayne will be able to qualify for yearly record in the registry association. A large per cent of cows in the testing associations of the state are grades, but breeders of pure-bred animals are also interested in cow-testing work. It is estimated that about 13 per cent of the 42,000 cows now on test in these associations are pure breds.

Gertrude Wayne Colantha Fayne.

Pure-bred Holstein, high cow Wisconsin Testing Associations for October—Owned by E. G. Race, Winnebago county.

Dairying Clubs and Better Dairying.

Boys' and girls' dairy clubs are becoming prominent among the projects advocated by our states and by the nation. Correlating the work of the school and the home is revolutionizing the school and is having a very helpful effect upon the home and farm. The dull boy has found a line of interest and often has become fascinated with his club work. The despised grammar has, to him, become an inviting proposition of writing up the story of his calf or his crop and he has become willing to go to any extent in studying out means and methods of writing his composition in correct language.

Dairy clubs for boys and girls and home project work on dairy subjects offer a very interesting line and one upon which the results are very definite and upon which useful conclusions may be drawn. They bring into play all the problems of selection, feeding and shelter. No doubt this line of work was started when each pupil was permitted to bring to school a sample of milk from a favorite cow and to have it tested or to test it for its percentage of butter fat. There may not be very much in a single test of a cow's milk on account of the fact that variations arise from so many different causes. Be that as it may, it has opened up a world of interest worthy of the endeavor of any boy or girl. Naturally questions arose as to the advisability of weighing the milk and testing it regularly. This would give a correct record. Once this record-keeping was started there arose a desire to induce each cow to do her best and this led to liberal feeding. Then, as it was necessary to produce the milk at the cheapest rate possible, it was natural that a careful study be made of the cost of the different feeds available.

Local contests in keeping records have led to family and community interest. Naturally each family desires to see its representative win. Just as surely they were interested in determining the reasons for success or failure. The widely varying results secured by different contestants opened the eyes of many to the fact that cows vary greatly in their ability to return a profit. The interest aroused in this manner has induced many an owner of a dairy herd to start a yearly test on all animals. Cow-testing associations have grown from a nucleus of a a few boys and girls doing testing through the schools. In one instance a dairy extension man made an effort, and a very creditable one, to start a cow-testing association in a certain county. It was found to be a task almost impossible, because not one cow in the country had ever been on test and because not one man in the country had ever had experience in testing his herd. Only about 200 cows were promised when the proposition was turned over to a man employed to teach agriculture and nature study in the schools. Wisely he made it a school project and before a year had passed the people of the country were enthusiastic over testing and since that time practically every cow in the country has been on test.

The worth-while dairy cow contest must run through a year, as it is only a full year's record that can show the real merits or lack of value of the cow. The full-year record will show that the three-months or the one-month or the seven-day contests are not the ones to show the cow's real value in the herd, as it frequently happens that the one that may produce a very good record for a short time is not persistent and may lose on a long test.

Contests in calf feeding and in growing young heifers through one milking period are worthy of consideration. This requires at least three years of careful work and necessitates almost absolutely that it be done under a system that furnishes some sort of supervision throughout the year. Whatever the nature of any contest it serves a useful purpose if it interests the pupils in dairy or farm work. If it does that it will have a helpful influence upon the cause of better dairying and will help greatly to solve the problem of keeping the boys and girls on the farm.

Jessie Fobes 2d Maude Homestead.

A thirty-one-pound daughter of Homestead Jr. De Kol—This cow owned by S. E. Jones, Watertown, Wis.

Very naturally most of the dairy contest work has been started and conducted by the use of cash prizes. There is merit in this and at the same time there is a lack of permanence attached to it. The plan so rapidly com-

Put Your Faith In A Kalamazoo

A silo is a *permanent* investment, therefore purchasing a silo is not a question of paying a few dollars more or a few dollars less, but of getting a silo that is *right*—in design, in material, in construction.

"Kalamazoo" is the answer. For more than twenty-seven years thousands of successful farmers in all parts of America have put their faith in

Kalamazoo TILE AND WOOD SILOS "The World's Standard"

Last year alone upwards of *six-thousand* new purchasers of silos unanimously decided in favor of the Kalamazoo. And those who bought twenty or more years ago still swear by the Kalamazoo because time and experience have proven conclusively that Kalamazoo silos are *right*, from every standpoint. There's a big dollar's worth of *value* in every dollar of the cost whether you buy a glazed tile or a wood stave Kalamazoo.

They're built to meet the needs of farmers who know and appreciate the feeding value of ensilage and know how a silo should be built to make and preserve ensilage *right*. Kalamazoo Silos excel in design, material and workmanship—combining every desirable feature a silo should have and embodying the knowledge acquired through long experience in silo building. You can't go wrong in buying a Kalamazoo.

GLAZED TILE SILOS—"Permanent as the Pyramids"—fire-proof, frost-proof, storm-proof, moisture-proof, acid-proof, decay-proof, vermin-proof. Galvanized reinforcing. Require no paint, no upkeep expense or repairs. First cost is the last cost. Easy to build—and once built your silo problem is solved *forever*.

WOOD STAVE SILOS—Your choice of four of the best time-defying woods. Kalamazoo Silos are manufactured complete ready to set up. Quickly and easily erected by inexperienced home labor. All Kalamazoo Silos, whether wood or tile, have the famous Kalamazoo Galvanized Steel Door Frames and continuous doors which are universally recognized as the best ever designed.

Write Today for our free descriptive booklet and details of our easy payment plan. If interested in an Ensilage Cutter, ask for Kalamazoo Cutter Catalog.

ing into practice of correlating it with school studies and making the home work a part basis for school credit no doubt has the greater merit. One of our great states has adopted a system of township vocational teaching whereby the agricultural or vocational teacher is employed for twelve months and devotes all his time during the summer to supervising the home project work, dividing his time during the balance of the year between the school and the home. Other plans are in vogue of furnishing a teacher qualified to do supervisory work in club work all of which are good. The main thing is to supply a teacher that can furnish information and help.

The movement for dairy clubs of some useful type is growing rapidly. This movement has the support of dairymen, teachers, parents, bankers and business men and the record associations. The keenest of interest is manifested everywhere and we may well expect greater things in the future.

Passing of the Farm Churn.

Cream separators and power machinery for creameries are robbing the farm woman of one of her historic, if not poetic, tasks—that of buttermaking. Most of us who grew up on farms will recall the one morning or two or three mornings per week when the churn was brought up from the cellar and when the cream was warmed near the kitchen range and then one or two hours of steady turning or splashing, depending upon the type of churn. The butter was lifted out with wooden paddles and put into a circular bowl, where it was worked, drained and salted. Following that the surplus was put into proper form for marketing. In the winter that usually consisted of working it out in circular molds of one pound each. The surplus was taken to the grocery to be traded out in groceries or perhaps peddled out to a few regular customers, who took a stated amount each week and who paid cash for same. To be the best buttermaker in the neighborhood is no longer prominent among the ambitions of country housewives.

More and more has it become the custom to sell cream off the farm instead of making it into butter. This is just as logical as selling wheat instead of grinding it into flour. Just as the immense grist mills can handle large quantities of wheat more easily and more economically than it could possibly be handled on each farm so can the creameries throughout the country handle the cream from our milk cows more easily and more economically than it could be done on the farms. Whether or not there shall be made on the farm butter for home use is a question that frequently occurs. Rapidly is it ceasing to be the custom to churn even enough for home use. Where cream gathering wagons make their daily or tri-weekly trips it is a simple matter for them to carry butter enough to supply the requirements of each person. When the farm auto or wagon delivers direct to the creamery it certainly is no hardship to bring back the needed quantity of butter.

So great has the practice of disposing of all milk and cream become that in districts where milk is sold to condenseries there have frequently occurred butter famines when upon Saturday evening not a single pound of butter would be available. This was a case of carrying the matter to an extreme. It is doubtless absurd for a specialized dairy community to be without butter for Sunday. Ordinarily, however, this is not apt to occur and the family that sends all of its milk or cream to market will be able to secure all the good butter that may be desired.

The change from selling butter to the grocery has relieved the housewife of the embarrassing necessity of trading out the price of the butter at that particular store. Under present conditions cash is received at the creamery or at the shipping station, which enables the money to be spent at will just as is the money from the sale of wheat or corn or hogs. The grocer, too, feels a very great relief. Formerly it was his duty to take all butter that came to his store. All grades of butter, ranking from very good to very poor, were brought to his counter. It was necessary that he accept all or else some patron would be offended and he might lose trade thereby. For the same reason it was necessary for him to pay one established price to each, else some jealous housewife might be offended. Some butter was so bad that it could not be resold. It was necessary to dispose of this in some other manner, usually at a loss. Now the grocer has little or no country butter to bother him. He sells

SUCRENE Dairy Feed

Cows fed on Sucrene give 25% more milk in three weeks' feeding—at a substantial saving in feed cost.

Our experts have demonstrated this fact many times with Sucrene Dairy Feed on our own experimental farms, and their experience is duplicated by thousands of dairymen and farmers.

SUCRENE DAIRY FEED, Hay and Water Is All Your Cow Needs

to make more milk. Sucrene Dairy Feed is a complete, scientifically correct milk-making ration, supplying necessary protein, carbohydrates, fats and mineral matter to meet the daily needs of the cow for milk production and for maintaining the body in vigorous health all the year 'round.

SUCRENE DAIRY FEED is composed of cottonseed meal, corn gluten feed, ground and bolted grain screenings, corn distillers' dried grains and solubles, clipped oat by-product, molasses, palm kernel meal, calcium carbonate and a little salt. Guaranteed analysis: 16½% protein, 3½% fat, 46% carbohydrates, 14% fibre.

Variety—Palatability—Easy Digestibility—Economy

are four important requisites which give Sucrene Dairy Feed its high place in the dairy world—16 years the recognized standard of milk feed quality.

Save your high priced grain. Order a ton of Sucrene Dairy Feed from your dealer. Accept no substitute. A week's feeding will show satisfactory results in the milk pail. Write us your dealer's name, if he does not handle Sucrene, and we will see that you are supplied.

Fill out and mail us the coupon, for valuable books on care and feeding of farm animals. Check the feeds in which you are interested.

Where Disease Shows First

Just watch the milk yield for the first sign of weakening in the cow's system. If your cow is not giving the quantity or quality of milk you expect, it is time to give her medical attention.

For twenty-five years thousands of the most progressive dairymen have used Kow-Kure as their "first aid" when a cow shows signs of "falling off" or coming down with disease. Particularly before and after the calving period, the use of Kow-Kure is valuable. It is a sure preventive of Milk Fever and Retained Afterbirth, and will enable the organs to resist the diseases which frequently originate at this time.

Kow-Kure has a positive action on the genital and digestive organs, toning them up, making them perform properly and helping the system to function as nature intended. Kow-Kure has proven a prompt remedy for Abortion, Barrenness, Scouring, Lost Appetite, Bunches and other common ills.

A small investment will prove the worth of Kow-Kure in your dairy. Put it to a severe test; try it on your poorest milker and watch results. Druggists and feed dealers sell it; 55c and $1.10 packages.

DAIRY ASSOCIATION CO.,
Lyndonville, Vt.

Free Treatise, "The Home Cow Doctor" Sent to Dairymen on Application

creamery butter of a uniform grade to his patrons and this is satisfactory to them. The housewife comes with cash and purchases his goods to the same extent as under the old barter system.

The passing of the farm churn has been a distinct relief to the housewife and leaves her with more time for the numerous and complex duties of her home. It enables the public to be supplied with a more uniform and possibly a better supply of butter. In every respect the change is to be commended.

Getting Experience in Dairying.

Experience counts for much in the dairy business. The old adage that "Experience is an expensive teacher," is not true if we apply it to the getting and making use of the experience of successful dairymen. The successful experience of men long in the business is genuine useful wisdom. By observation we are able to divide men into two classes, the successful and the unsuccessful. The experience of each is useful. We are not to be imitators. Rather than that we are to think and to consider the experience of each man in the light of its bearing upon our particular case. We shall thus be able to avoid the blunders and pitfalls of the one class and shall follow and shall profit by the success of the other.

Present-day knowledge is largely an accumulation of experience. In some past year a man fed silage in a rather crude manner. Silage proved good and more of it was fed. Types of silos were tried and combinations of silage with other feeds tested until today the silo is adopted widespread as one of the biggest factors in successful dairy feeding. Were a man to close his eyes and his ears to all the experience and knowledge that has accumulated it would be the same as going back to beginning and attempting to learn through mere rough experience what is available public information merely for the asking. Using the silos as an example one can readily see the absurdity of this.

Young men believe in experience. They are proceeding to get it from the best dairymen in the land. Every year there are large numbers of young men at work on dairy farms who contemplate starting into business for themselves. They desire to learn the best practices of those who lead in the game. These young men make very capable hands while at work and it usually is with the greatest reluctance that their employer consents to their release when their term of employment is ended. Experience gained in this way is not expensive. The employer has the benefit of a trustworthy, thoughtful man. The one seeking experience has the benefit of good wages in addition to his experience. Thus if he has sacrificed anything it is merely the difference in his earning power between what he might have earned and what he actually received as a farm hand. Formerly it was required that any man contemplating a career in any certain line was compelled to serve an apprenticeship extending for several years. Often the most capable men of their times secured the groundwork of their success through these years. Getting hard, practical experience as it is done by working for a successful man gives all the benefits of the old-time apprenticeship without the undesirable conditions being attached.

On the show circuit as no other place is the experience intense and valuable. Men who have been turned down have profited by their experience. Others have grumbled and have claimed unfair judging and have refused to progress. The ranks of successful exhibitors are being filled with recruits from the cheerful and thoughtful losers. At winter meetings, at institutes, at picnics and at sales dairymen constantly have opportunity to gain the experience of other men. Progressive men are taking advantage of those opportunities. Experience is valuable and it is most economical when it is the experience of some successful man and applied to our own work. Getting experience has a variety of names. We hear some men speak of it as "swapping ideas." Another says that he likes to "rub shoulders" with dairymen who are making good. Whatever it may be called, the experience of other men may be made to play a very useful part in the success of any dairyman.

The Right Start With Dairy Cows.

In a certain locality are two farmers whose earlier training and experience have been very similar. Both were farm reared. Both made a business of raising farm stock of a very ordinary class. Both had learned to appreciate the little cream checks that came to them when a creamery had been started in a town near by. Both had heard of dairy cattle, but neither really knew anything of them. Each developed a desire to buy cows of a dairy breed which was made possible by a dealer shipping in a supply of cows advertised as dairy stock. The two men made their selections, one of them taking four and the other only one.

The man who purchased four was very sorely disappointed. The supposedly dairy cows gave much less milk than the farm cows he had been milking. The other man, perhaps by accident, secured a really good producer. She was so good that probably twice as much butter fat was sold from her as from any other cow in the locality.

The result after three years is that the man who secured the inferior cows is disgusted. He declares his intention of adhering to his old line of farm cows. The other is enthusiastic. He says that he has proven that there is money in dairying. He will buy more cows and make milking an established line of work on his farm.

It was a mistake for those men to purchase blindly as they did. The second might have been as sorely disappointed as the first. Any man who contemplates starting in dairying should avail himself of all possible sources of help in buying. Always there is some man available who will assist in purchasing. It is much better to wait until selection can be made right than to rush into the game and later be sorry for having done so.

There are well-defined principles that must not be violated. The fact that there are good cows and inferior cows in all breeds is a factor that must be given its full share of consideration. This has an application from the case above. The cows had been shipped in by a dealer who did not know dairy cows, but who had a desire to make money. He had gone to a dairy or semi-dairy section of the country to buy. Very naturally the dairymen of that locality had a number of cull animals they were very anxious to sell. This, combined with the fact that the dealer wanted to buy cheaply, and the other fact as mentioned that he did not know dairy cows, caused him to buy up a lot of very inferior animals. He knew nothing of records. He asked nothing of records. A moment's consideration would have shown that his purchase was doomed to disappointment.

Dairy cows to be profitable producers must have the type of dairy cows. They must have udders of the right shape, large and with good quality. A man must be a competent judge of dairy cattle if he is to buy with any hope of securing animals that will be satisfactory. It is not enough to purchase a cow of the correct type, for there is variation in production with cows of apparent equal merit in conformation. It is the yearly test that qualifies a cow as a desirable animal or not. More than that it is well for the dam to have made a good record and for the sire to be from a high-producing strain. The man mentioned above might well have spent the money the four cows cost him for one good cow. The income from her would have been nearly as much. The cost of feed would have been but little more than one-fourth as much, yet the profits would have been a great deal more on account of the saving of feed.

"It pays to start with good stock" is an axiom with many men of successful experience. Sometimes men are tempted to start with cheaper stock and breed up to a better quality. It is entirely possible to do this, yet it is probable that the lesser income during the years the grading up is in progress makes it the least profitable in the long run. The man who starts with good stock has years the advantage and in many cases will maintain that lead and will be more prosperous while doing it.

Farm Larger Acreage With Tractor.

To the Editor:—I will try and tell you a little of my experience with the tractor in the last three years. I do not find that it will displace any great number of horses the way we farm in this part of the country, but it will increase the acreage.

I have not used my tractor any this year, as I sent the engine to the factory for repairs and the railroad was three months shipping it to the factory and back.

I find the tractor, like all machines, some days will work all day without a mishap and the next day it will be one thing here and another there. Compare it with a corn binder—how fine they work some days and the next day they will give you a hatful of trouble. The horses do not have any show with a tractor in hot weather or any other time. L. W. Weis.

The silo is an absolute necessity any year, but it is especially important when feed is high and when there is any sort of scarcity.

FARM MECHANICS

Questions and Answers.

Ford Fans.

Could a two-bladed fan be used on a Ford car by chiseling off the other two blades? Would this be too great a strain on the fan shaft? Please tell me whether it is advisable or not.

Answer.—We do not think this advisable. Should you wish to remove two of the blades, saw them off with a hack saw or drill out the rivets. It might be possible to remove the blades with a cold chisel if considerable care is taken not to spring the fan hub.

Making Engine Pull Itself.

I am thinking of making a one and one-half horse-power engine pull itself. The engine runs 500 R. P. M. I have all the gears except the one on the engine shaft, and I do not know what size it should be. I could change some of the other gears if necessary. I would like for the engine to travel as fast as possible without injury to the engine by jolting. The drive wheel of the truck is thirty inches diameter. This wheel is driven by the drive wheel shaft, which is fitted with a gear four and three-fourths inches diameter. This gear meshes with a gear five and three-fourths inches diameter on a jack shaft. At the other end of the jackshaft, there is a three and three-fourths-inch sprocket that I wish to drive from the sprocket on the engine shaft. How large a sprocket should I use on the engine shaft?

Answer.—Use a sprocket about two and one-fourth inches in diameter on the crank shaft and replace the four and three-fourths-inch gear on the drive axle with a twenty-inch gear, leaving the sprocket and gear on the jack shaft as stated above.

Carbon Causes Spark Plug Trouble.

What do you think would be the most probable cause for our spark plugs getting dirty in our four-cylinder Buick car? The one at the dash and the one next to the fan are the ones to blame. Now, this trouble may be carbon. Would you advise the use of "Worko" tablets to remove carbon? We are using high-test gas and the engine oil is supposed to be good. The same thing bothered last fall till I got four new spark plugs, which stopped the trouble. New plugs fail to remedy this trouble now. We would like to have your help.

Answer.—Evidently too much oil is working up into the cylinders. This may be due to carrying too much oil in the crank case, loose-fitting rod bearings, small pistons, or worn piston rings. Do not carry a higher oil level than the makers specify, and be sure that the oil level gauge is working. If the piston fits the cylinder so loose that it may be inserted in the cylinder with more than one sheet of newspaper wrapped around it, slightly larger pistons should be purchased. New piston rings might stop the trouble. A V-shaped groove cut around the piston just below the lower ring with several small holes drilled in it will probably stop the trouble by allowing the excess oil to drain back into the crank case. We have never used the tablets referred to for preventing carbon. It might be well for you to try them.

Making a Fan.

I would like a little advice on making a blower for a feed cutter. My feed cutter capacity is one to one and one-half tons of dry fodder per hour. I want to use fifteen feet of blower pipe. (1) What size of blower pipe should be used? (2) What sized blower should be used? (3) Please give width and length of fan blades; also diameter of clearance space at the center. (4) How many revolutions per minute should the blower be run? (5) What horse power will be required to run the blower? Please publish diagram.

Answer.—Use blower pipe seven inches in diameter. Six-inch pipe would be large enough if the fodder is cut fine enough to prevent clogging. The fan should be about twenty-two

FIGURE 1.

inches diameter, the blades being six inches wide. The diameter of the intake at the center should be about twelve inches. The blower should run at 1,500 R. P. M. The construction of the fan, which may be made at home with few tools, is shown in Figures 1 and 2, Figure 1 being a sectional view. A shaft about one and one-

FIGURE 2.

half inches in diameter is mounted on a wooden framework in two bearings, preferably Hyatt roller bearings, as they require less attention and run with less friction than plain bearings. The pulley should be six inches in diameter and have a six-inch face with a liberal amount of "crown." The framework may be made from 4x4 yellow pine. In the figure, S is the shaft, CC the bearings and D the pulley. The fan itself consists of a steel disk twenty-two inches in diameter and one-eighth of an inch thick, bolted to a cast iron hub H. The hub itself should be not less than three inches in diameter and the hub flange should be at least six inches in diameter. The four fan blades are riveted to the disk and bolted to the cast iron hub as shown in Figure 2. It will be noted that the blades are not set radial from the hub, but slope back about 30 degrees, that is, one-twelfth of a circle.

The fan housing should be made of sheet iron one-sixteenth of an inch thick. It may be mounted on the framework by iron straps. The housing should not be mounted central with the fan, but over to one side so that the fan clears the housing only half an inch at point A and five inches at B, Figure 2. A wooden chute, I, conveys the fodder from the cutter to the blower. The sides of the housing should clear the fan one-half inch on each side. A three-horse-power engine should drive the outfit easily. If the blades cause trouble by bending, rivet angle irons on the back of each blade. The fan feeds easier if the blades are narrower at the middle than at the outer end, the construction being somewhat weaker, however. The rotating parts should be very carefully balanced to prevent vibration.

Repairing Radiator.

Can tin and copper be soldered together? How can I mend a radiator that has the two back pipes broken? Could I solder some tin on the pipes, and how can I do it?

Answer.—It is easy to solder tin on copper. Clean the surfaces to be soldered, rubbing them with emery cloth or sandpaper until they are bright. Apply soldering fluid, made by dissolving as much zinc as possible in muriatic acid, washing the surface with it. Heat the surface to be soldered with a small blow torch, taking care not to melt the solder at some other point of the radiator. As soon as the surfaces are hot enough to melt solder, apply solder to them and rub the solder over the surface with a swab wet with soldering fluid. This will tin the surfaces. Press them together and apply enough heat to melt the solder between them. If the pipes are merely cracked, tin the tube as above and cover the crack with solder.

Kerosene for Cooling Tractor.

I am running a corn sheller with my 25-45 horse-power tractor. Would it be advisable to use kerosene in the radiator for cooling as an anti-freeze solution in place of water and alcohol? As the radiator on my tractor has so large a capacity—eighty-five gallons—it is a big job to draw the water off every night and fill it again in the morning. There is no hose in the water line. I have a small extra water tank on the engine to feed the water with the kerosene. I burn kerosene for fuel, starting with gasoline. Would there be danger of fire or of an explosion if I use kerosene for cooling? The cooling liquid is circulated by a pump.

Answer.—We have never recommended kerosene for cooling automobile engines, but under the above conditions we would consider it advisable to use it in a tractor. There would be no more danger of fire than there would be with a strong alcohol solution, and there is no hose to leak and cause trouble. You could probably pipe the heated kerosene to run your engine with improved results. In this case, it would be necessary to make arrangements to keep the required amount in the radiator. As a rule, kerosene is a much better fuel if heated.

GOOD MEN WANTED TO LEARN THE AUTO BUSINESS

Any ambitious, capable young man can make a success for himself, and if you will only prepare yourself, you will get work, because positions are open, waiting for competent men to do Auto and Electrical work.

The American Auto College develops your talent for a splendid, big paying trade. Our course has been enlarged with lots of new work—principles of Knight Motors, 8 and 12-cylinder Engines of new models, Tractors, new Starting Systems, Magnetos, Wiring, Coils, Welding, Brazing, Lathe work, Milling and Drill work, Tool making, Overhauling and Repairing, and all the newest, up-to-date Auto equipment.

AUTO College

$900 TO $3,000 SALARY OR BUSINESS PROFITS PER YEAR

Positions Are Open
Tinker repair men are let out as fast as good men are found to take their places. Garage men, letters and telegrams come to us asking for good men. Just prepare yourself and your future and success will be started. Think of the good time, and the money you can make.

LIFETIME OPPORTUNITY—It's up to you to be either a common, hard-working laborer or else learn a good business. Thousands of men will go into the Auto business within the next year. Be one of them. We want you to. Get started right away. Learn here where the opportunities are greatest and best, by our system of actual work in our large shops. No books used; we furnish tools. You do the work yourself. Our men learn easily and quickly because practical work is the best.

Big Electric Starter and Tractor course FREE with the regular Auto course. Write for our big FREE Catalog now.

AMERICAN AUTO COLLEGE, 406 Auto Bldg., OMAHA, NEBRASKA

This Mill Lasts A Lifetime

Has no buhrs or other parts to wear out. Every part strong and well made. Big capacity—requires small power. Does not heat the feed. Guaranteed to get the wild oats.

HOWELL *Roller Feed Mills*

are the modern, scientific machines for grinding feed and rye or graham flour. Have corrugated steel rolls, same as used in the large flour mills. Add to your profits by grinding feed for your neighbors. *12 sizes—any capacity—a size for any engine.*

FREE—Our complete catalog and the Famous Roller Mill Puzzle. Write for them today.

R.R.HOWELL & CO., 8 Malcolm Ave S.E., Minneapolis, Minn.

Christmas Candies Without Sugar

Sugar is scarce and no patriotic American woman will think of using it this year for Christmas candies, as she has done in the past. This does not mean that she need do without candies during the holidays. The human body needs sweets, but these can be furnished without the use of cane or beet sugar, as there is any number of things which may be used as substitutes—molasses, honey, maple sugar, corn sirup, combination of nuts and fruits—and the resulting confection is both wholesome and attractive. Below are some recipes—without an ounce of cane or beet sugar—that will answer the purpose quite as well as though pounds and pounds of it were used:

Maple Fig Bars.—Two cups maple sugar, one cup chopped figs, three-fourths cup milk, one-fourth teaspoon cream of tartar, one teaspoon lemon flavoring. Grate or shave the sugar, put into iron pan with milk and cream of tartar. Boil slowly twenty-five minutes; add figs and flavoring and boil one minute. Pour into buttered tins and cut into strips or blocks while warm.

Bitter Sweets.—For this purpose use dates, citron, candied orange peel or crystallized fruit. Melt unsweetened chocolate in a double boiler. Keep the chocolate just warm enough to prevent solidifying. With a silver fork drop pieces of fruit into the chocolate. See that each piece is completely coated, then remove to waxed paper to harden.

Corn Sirup Taffy.—Two cups yellow corn sirup, one teaspoonful grated or scraped lemon rind, three tablespoons lemon juice, one teaspoon vanilla. Boil the corn sirup to the hard crack stage as for any taffy. Remove from the fire and stir in scraped lemon rind, lemon juice and vanilla. Pour in well-oiled tins, and when cool enough to handle, pull until light and break into pieces.

Chocolate Dainties.—Put through the meat chopper one-half cup each of dates, figs and nut meats. Add one tablespoon of orange juice, a little grated orange peel, and one square of melted unsweetened chocolate. Mold into balls and roll in chopped nuts. This mixture may be packed in an oiled tin, put under a weight until firm, then cut in any shape desired.

Yellow Jack Straws.—Two cups New Orleans molasses, one teaspoon baking soda, one tablespoon vinegar. Put the molasses into large iron pan over fire, not too hot, stir constantly until it begins to get thick, then test a little in cold water. It must get crisp at once. Add vinegar and baking soda, stir quickly and pour at once on greased platter. When partly cold oil or rub hands with butter and pull rapidly until it is a light yellow. Pull into long thin stips (like straws) and cut into three or four-inch pieces, or into small pieces the same as caramels. Be sure you use a pan that is large enough because the molasses froths when soda and vinegar are added.

Maple Creams.—Boil one cup maple sugar with one cup water until it forms a soft ball when dropped in cold water. Remove from the fire and stir rapidly until it becomes creamy. Form into balls the size of marbles and put nut meats on either side. Lay on wax paper to cool.

Maple or Chocolate Pop Corn Squares.—Boil together two pounds of maple sugar, one pint of new milk and a quarter of a teaspoon of cream of tartar. When the sirup makes a soft ball in cold water, add two tablespoons of butter; stir it gently and remove from the stove; add a teaspoon of vanilla; set the pan in a vessel of cold water and beat until it begins to cool. Then pour into greased, straight-sided pans and strew thick with pop corn. While still soft cut into squares, but cut again in the same lines when cold. Chocolate bars may be made by adding half a cake of bitter chocolate.

Even those who have been in the habit of buying their holiday candies would do well this year to try some of these recipes or purchase similarly made sweets from the dealer.

The Christmas "Piece."

With school and church holiday entertainments in preparation the little girls and boys will be looking about for a "piece," or beseeching mother to find one that suits the occasion. Perhaps one of those here given may save mother an hour's searching:

THE BEAUTIFUL BETHLEHEM BELLS.

Over the roar of the cities, over the hills and the dells,
With a message of peace to the nations, ring the beautiful Bethlehem bells,
Bringing joy to the souls that are sighing in the hovels where poverty dwells—
There is life—there is life for the dying, in the beautiful Bethlehem bells.

Far off, in a land that is lovely, for the tender sweet story it tells,
In the light of a glorious morning rang the beautiful Bethlehem bells;
And still in the hearts of creation an anthem exultingly swells,
At that memory sweet of the ringing of the beautiful Bethlehem bells.

They rang o'er the hills and the valleys, they summoned the glad world that day,
From regions of night to the radiant light of the cot where the Beautiful lay,
And forever and ever and ever a wonderful melody dwells,
In the tender sweet ringing and singing of the beautiful Bethlehem bells.

For they sing of a love that is deathless—a love that still triumphs in loss;
They sing of the love that is leading the world to the calvary cross:
Ring sweet o'er the sound of the cities—ring sweet o'er the hills and the dells,
And touch us with tenderest pities, oh, beautiful Bethlehem bells.
—Frank L. Stanton.

A CHRISTMAS LETTER FROM WILLIE.

"Dear Santa Claus," wrote little Will,
In letters truly shocking,
"I'z been a dood boy,
So pease fill a-heapin' this stocking.

"I want a drum to make pa sick
And drive my mamma crazy;
I want a doggie I can kick,
So he'll not git lazy.

"I want a powder-gun to shoot
Right at my sister Annie,
And a big trumpet I can toot
Just awful loud at grannie.

"I want a druffle big false face,
To scare in fits our baby;
I want a pony I can race
Around the parlor, maybe.

"I want a little hatchet, too,
So I can do some choppin'
Upon our grand piano new
When mamma goes a-shoppin'.

"I want a nice hard rubber ball,
To smash all into flinders
The great big mirror in the hall
And lots and lots of winders.

"And candy that'll make me sick,
So ma all night will hold me,
And make pa git the doctor quick,
And never try to scold me.

"And, Santa Claus, if pap says
I'm naughty, it's a story;
Just say if he whips me I'll
Die and go to kingdom glory."
—Lizzie Alderdice.

THE EMPTY STOCKING.

There's an empty stocking hanging from many a little bed,
Where a God-blown dream hangs over each sleeping curly head;
And the vision gathers nightly of a day that's soon to come,
Where little feet should patter to the music of the drum.

There's an empty stocking hanging by many a wind-blown door,
That must wait in vain for Christmas, in the gray haunts of the poor;
And eyes that now shine brightly shall, through a rain of tears,
See nothing there on Christmas but the sorrow of the years.

But out where splendor centers in the mansions of the great,
No call will go unanswered, no tot will vainly wait;
The Christmas horn will summon—the Christmas drum will roll
The tide of joy in magic through the gateway of each soul.

But where one gift would brighten the dark of weary days,
No reindeer's hoof will thunder o'er Poverty's drear ways;
And so, for God's white season—for some wee dreamer's cause—
Don't you think that you might whisper just a word to Santa Claus?
—Author unknown.

SIGNS OF CHRISTMAS.

When ma begins to tiptoe round
'N we begin to hear
A certain, hushy, whisp'rin' sound
About this time of year,
We know that she'n Sandy Claus
Are fixin' things to do
'N so we never peek, because
They never want us to.

When sister Mary goes about
A-hintin' that she wishes
She had a teapot with a spout
To match her set of dishes,
We know it's time for us to write
Our letters 'n to set 'em.
Beside the hearth, where, in the night,
Ole Sandy Claus'll get 'em.

When all the seats in Sunday school
Are filled 'ith girls and boys,
'N no one ever breaks a rule
'R makes a bit of noise,
We know it can't be very long
Till Sandy will appear,
'N pass his presents to the throng
That comes but once a year.

When Aunt Melindy comes 'n brings
The children 'n the bird,
'N she'n ma make pop corn strings,
We never say a word,
But anybody ought to see
That she has come to stay
Till time to have the Christmas tree,
Which can't be far away.

When pa comes skeanin' crost the lot,
A-lookin' guilty, so't
You'd think he stole the things he got
Inside his overcoat,
We know it's time for us to run
'N carry in the wood
'N see that all our chores are done
'N otherwise be good.
—Willis B. Hawkins.

Advice for the Home Milliner.

It is not a difficult matter to cover the brim of a hat if one but knows how to go about it.

When the brim of the hat is of uniform width and not too wide, a bias strip may be used for covering the brim. If the same material is to be used on the upper and under side, it will not be necessary to have a seam at the edge.

The strip must be cut on the true bias and be about two inches wider than twice the width of the brim. Fold the strip through the middle lengthwise and mark the center with a line of uneven basting. Stretch the material along this folded edge; slip over the brim, keeping the line of basting at the edge and pulling the material snug. Pin in place, putting the pins in at right angles to the edge.

When the strip has been fitted around the brim, mark the place of joining. Remove the pins, take off the material and baste and stretch the seam. Be sure to have the seam with the straight of the goods.

Put the bias over the brim again and pin in place. Have the line of basting at the edge and the seams at the sides, but toward the back. Baste near the edge, catching the material on both the upper and under sides.

Run a gathering thread near each of the cut edges. Pull the material from the edge of the brim toward the crown and adjust the gathers evenly. First pin and baste the material in position on the upper side, taking the stitches just beyond the bend where the brim joins the side crown. Adjust and baste the under side, pulling the material snug.—[Charlotte E. Carpenter.

THE YOUNG FOLKS.

Never Misses a Sunday at Church

Dear Young Folks:—I have written to you before, but I guess Mr. Wastepaper Basket siezed the other one. I never fail to read your letters.

I am a girl of thirteen. My birthday is the third of July. Have any of you a birthday so near a holiday? I live on an eighty-acre farm six miles from town. My mother and I raised chickens this summer and tried to raise ducks, but failed. I have two sisters and two brothers. My youngest brother is six weeks old.

We live one mile from church. How many of you are going to church as regularly as I am? I have gone almost two years without missing one Sunday. We work for gold pins. I have a gold pin and the second Sunday in January I will have a gold wreath on my pin.

We have a pony on which we ride whenever there comes a spare minute. he is very gentle. Five children have ridden him at once. Don't you think that is quite a load? Ora.

Answer to Homer's Riddle.

Dear Young Folks:—I am a farmer boy nine years old. I live on a farm of 240 acres. My father has horses, sheep, cattle and hogs. We also raise lots of chickens.

I have one brother, Merle, aged twelve years, and one sister, Ilene, four years old. My brother and I each have a bicycle.

We don't have very far to go to school because we just live across the road from the schoolhouse. I am in the fourth grade and I like to go to school. We have thirteen pupils, six boys and seven girls.

Homer asked what is the oldest table in the world? I think the answer is the multiplication tabe. Claire.

Made Money for the Library.

Dear Young Folks:—I am eleven years old and in the eighth grade. I have four brothers and six sisters and my father. My dear mother died last winter. My smallest sister is two years old. Her name is Elizabeth.

We had a basket social last week and raised $38.25. We intend to buy a library and some new books.

The day before Thanksgiving we had a dinner at school. We had chicken, pumpkin pie, sandwiches, dressing for the chicken, pickles and salad, besides fruit and candy.

I will answer the riddle three-fourths of chicken, two-thirds of cat and one-half of goat. I think it is Chicago. Elsie.

International Sunday School Lesson.

Lesson for December 9, 1917.

Ezra and Nehemiah Teach the Law.

Lesson for December 16, 1917.

Nehemiah Enforces the Law of the Sabbath.

LESSON TEXT—Nehemiah 13.15-22.

GOLDEN TEXT—Remember the Sabbath Day to keep it holy.—Exod. 20:8.

Nehemiah remained in Jerusalem twelve years, from B. C. 444 to B. C. 432. He was then recalled and was in Persia some years, perhaps five or seven, but returned about B. C. 425, the year Artaxerxes died, for we know that he returned by permission of that king. Therefore, the date of this lesson would be some time in the summer or early autumn of 426 or 427 B. C., sixteen or eighteen years following last Sunday's lesson.

In the section, vv. 10-14, we see that the gifts for the house of God and the Levites, who led in worship, had been neglected. Whenever the house of God and its service of worship is neglected, we may expect that the Sabbath day and the worship of God will also soon fall into contempt. Ezra has dropped out of our history without a word as to his end.

I. "Remember" (v. 14) the Neglect of God's House. (vv. 1-14). The neglect of God's house grew out of the incursion of heathenism into Jewish life. Nehemiah realized that the purity of the race depended upon absolute separation from the mixed multitude. (v. 3). Nehemiah also confronted the difficulty of having a priest, (vv. 4, 5), who had defiled himself and also desecrated the temple, and finally the portion for the support of the priest and the temple worship had been withheld. (v. 10).

II. "Remember" (v. 12) the Sabbath Day. (vv. 15-22). Nehemiah's next and most difficult reform was regarding the fourth commandment. He at once set about to learn the facts; then relates what he saw (v: 15). The record also tells how he testified against them in that they were selling merchandise on the Sabbath Day. He contended with the nobles that they had done evil on the Sabbath day (v. 17). He testified against them that the merchants and sellers of ware had lodged about and within Jerusalem. (vv. 20, 21). The root of the trouble with Judah was that they forgot God's word and followed the devices and desires of their own hearts. The Jewish Sabbath in its outward form on the exact day of the week is not binding upon Gentile Christians (Col. 2:16, 17). It was given to Israel as a people, (Deut. 5:1, 2), as a memorial of their deliverance out of the land of Egypt and the house of bondage. (Deut. 5:6). The Christian, by the death of Christ, is made dead to the letter of the law of Moses, (Deut. 7:4), but the principle of the Sabbath is older than even the law of Moses and is as binding upon the Christian believer as are the many other principles which underlie

TAKE A Business Course

A TREMENDOUS DEMAND for trained young men and women. Salaries $900 to $1,250 per year. This school is known all over the Northwest for its superior training and ability to place its graduates. High school and teachers' courses. Also correspondence courses. Write at once for beautiful new catalog.

Today's Housewife Two Years---24 Big 10-Cent Numbers For Only a Dollar Bill

This phenomenal bargain must be accepted by you within the next twenty days because the cost of magazine-making is going up by the minute. Paper and ink alone cost us $150,000.00 more than last year.

Now that Congress has passed the Zone Postage Bill, which will add millions of dollars to the expenses of the various magazines, it is certain that very few magazines can continue to be published at present low prices. Most magazines will soon cost 20c per copy.

Every coming number of TODAY'S HOUSEWIFE will be so brimful of tested recipes and household pointers of such priceless value that you will get many times your money's worth, without even considering the many refreshing short stories, great serials and our new, superior Crochet and Fancy Work pages.

Never did any magazine fill a big need as TODAY'S HOUSEWIFE is filling it today in over a million homes. The lessons in Domestic Science now appearing in TODAY'S HOUSEWIFE are of incalculable value—their worth cannot be measured in dollars and cents to the woman whose heart and soul are wrapped up in the welfare and happiness of her family.

If you are that type of woman we urge you to send $1.00 today for a two-year subscription before it is too late. Remember this offer and the wonderful one-year club offers below are only guaranteed to last 20 days more.

Subscribe today and thus make sure the 20 days will not pass by, taking with them our special offer.

Today's Housewife Decreases the cost and Increases the joys of living.

TODAY'S HOUSEWIFE is the new title of TODAY'S MAGAZINE, with which has been consolidated The Housewife. This attractively illustrated housekeeper's magazine is bigger, brighter and better than either was alone. Every issue will afford your entire family many hours of pleasure and in addition the inspiration and encouragement that always make both present and future brighter.

the Mosaic law. In its exact form, the seventh day, the observance of the Sabbath belongs to the old order and not to the Christian order. Christ, who rose from the dead (Rom. 7:4), rose on the first day of the week, and we, as joined to Christ, are not under obligations to the Mosaic law, but to Christ. Therefore, the Lord's day, the resurrection day, the first day of the week, (Rev. 1:10; John 21.20; 1:19-26; Acts 27), is the day of privilege, not of obligation and is more sacred to us than the Sabbath day of these Jews. The Jews in Nehemiah's time showed their contempt of the Lord's day by making is a day of profit, whence this exhortation which we see set forth in this section. This should be a warning and an exhortation to us in these days of a secularized Sabbath.

III. "Remember" (v. 29) the Holy Priesthood. (vv. 23-31). In this section we see that the priesthood had even defiled themselves with women, and again this Nehemiah entered upon a cleansing process (vv. 30-31). The use of this word "remember" in verses 14, 22 and 29 gives strong emphasis to the three cardinal sins against which Nehemiah was battling.

IV. Summary: As in Nehemiah's time, so now, Sabbath desecration is the surest road to national ruin, and a large portion of our present calamity can be traced to growing irreverence for the Lord's day. Jesus swept away the cobwebs of Sabbath irreverence, but did not tear down the house. He kept the principle, but removed the barnacles with which the Pharisees and Jews had encumbered it. Jesus taught that the Sabbath was made for man and not man for the Sabbath, (Mark 2:27, 28), and he set himself as an example in this regard, for he is Lord of that day as well as the other days of the week.

The Sabbath is a day of rest and if observed, workmen without exception will produce more than is possible if it is not observed.

The chief value of the Sabbath, however, is in connection with the worship of God. The feeding of the spiritual nature; the rest which is to be differentiated from mere holiday or pleasure; its need for adult and child life; its educational value; its opportunity for Christian service and exaltation of family relations, all show it to have been created to fill a real need and to manifest the wisdom and goodness of God.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Enclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date fall and winter 1917-1918 catalog, containing 550 designs of ladies', misses' and children's patterns, a concise and comprehensive lesson on dressmaking, also some points for the needle (illustrating thirty of the various simple stitches), all valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

1945—Children's set of short clothes. The pattern is cut in 5 sizes, 6 months, 1 year, 2 years, 3 years and 4 years. It will require for the dress, 2⅝ yards of 36-inch material. For the drawers, ¾ yard. For the slip, 1½ yards for a 2-year size. Price, 10 cents.

1975—Ladies' dressing or home sack. The pattern is cut in 6 sizes, 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 3½ yards of 44-inch material for a 36-inch size. Price 10 cents.

1984—Ladies' house dress with sleeve in either of two lengths. The pattern is cut in 6 sizes, 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 6¾ yards of 36-inch material for a 36-inch size. Price 10 cents.

2012—Girls' one-piece yoke dress with sleeve in either of two lengths. The pattern is cut in 4 sizes: 4, 6, 8 and 10

1980—Night dress in high or low neck, and with sleeve in either of two lengths, for ladies and misses. The pattern is cut in 3 sizes for misses: 16, 18 and 20 years; and in 6 sizes for ladies: 36, 38, 40, 42, 44 and 46 inches bust measure. It will require 5⅞ yards of 36-inch material for an 18-year size, or 5⅝ yards for a 38-inch size. Price 10 cents.

years. It requires 3¾ yards of 36-inch material for an 8-year size. Price 10 cents.

2019—Girls' one-piece yoke dress, with sleeve in either of two lengths. The pattern is cut in 4 sizes: 4, 6, 8 and 10 years. It requires 4⅜ yards of 36-inch material for a 6-year size. Price 10 cents.

2293—A new practical design. The pattern is cut in 4 sizes: Small, 32 and 34 inches; medium, 36 and 38 inches; large, 40 and 42 inches; extra large, 44 and 46 inches bust measure. Size medium requires 3⅝ yards of 36-inch material. Price 10 cents.

2296—A pretty frock—ladies' dress. The pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Size 38 requires 6¼ yards of 36-inch material for the dress and 1½ yards for the jumper. Price 10 cents.

2307—A set of new collars. The pattern includes all styles illustrated. It is cut in 3 sizes: Small, medium and large. Size medium requires for No. 1, 1 yard of 27-inch material; for No. 2, 1 yard of 36-inch material; for No. 3, 1¼ yards of 36-inch material. Price 10 cents.

2315—A practical coat model. The pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. Size 10 requires 2⅜ yards of 54-inch material. Price 10 cents.

Waist 2317-Skirt 2313—A good costume for general wear. The waist pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. The skirt in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. A medium size will require for skirt and waist 5⅝ yards of 44-inch material. Two separate patterns, 10 cents for each pattern.

2322—A good school dress. The pattern is cut in 4 sizes: 8, 10, 12 and 14 years. Size 12 requires 3½ yards of 44-inch material. Price 10 cents.

A Red Cross Christmas

TO THOSE WHO FEEL POOR

I write as your brother.

We are a large family.

This world-war, made in Germany, against which we are fighting, has sent our incomes down and our expenses up.

The pinch hurts, but it is not going to kill us.

We still have enough and something to spare.

Though we feel poor, don't let us be impoverished by selfish fear!

Let us save in food, in service, in clothes, in luxuries and joy-rides—but not in money!

Let us use that by giving it to save the wounded, the suffering, our friends, our country.

Let us keep Christmas this year by keeping up the Red Cross.

Then it will not be a poor Christmas, but a rich Christmas to our hearts.

Henry van Dyke

Here is a Red Cross Service Flag that will be in the windows of millions of American homes this Christmas. It must be in yours—your service flag with a little cross for every member of your household. The nearest Red Cross chapter will give you your flag—it goes with every one dollar membership

A Service Flag for every Family to make this a RED CROSS Christmas of Mercy

ON this, our country's first Christmas, in the most terrible of all wars, there should be a Red Cross Service Flag in millions—fifteen millions—of homes at least.

When your membership dollar is sent on its errand of mercy, a work of relief, which is the noblest thing in the world today, is aided.

Your Red Cross does not ask you at this time for large contributions.

It asks you to become part of it. *Your* Red Cross asks you to be one of ten million more Americans to give one dollar toward world relief.

The merest outline of Red Cross work could fill this whole magazine—go to your local Red Cross chapter—have your rightful share of service. The Christmas spirit *is* the Red Cross spirit. Let a greater Red Cross be America's Christmas gift to our boys and our Allies.

What *is* Your American Red Cross?

An all American, largely volunteer organization devoted to practical service to suffering mankind—in times of peace as in times of war.

Congress authorizes it.

President Wilson heads it.

The War Department audits its accounts.

Pershing in France approves it.

It is working for *your* Army—*your* Navy—*your* Allies.

It is working for you.

Join the Red Cross now—start your $1 on its errand of mercy. Be a member—it is your right

Ten Million New Members by Christmas

The Publishers of The Wisconsin Farmer have donated this space to the American Red Cross in the belief that its readers will heartily respond.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

More "Horse Sense in the Poultry Business."

To the Editor:—I read with interest in last week's Wisconsin Farmer the contribution under the above caption by James Lawrey and wish to congratulate the writer upon his logic concerning the subjects touched upon. However, there are two or three points upon which it occurs to me Mr. Lawrey does not quite take in the situation, so to speak.

I, too, am a "fusser" with poultry, for many years, having handled chickens as a breeder for some fifty-five years, during which time I have kept at one time or other nearly all of the "Standard" varieties, and, like Mr. Lawrey, I find that to make fowls profitable one needs common sense. I wish also to go on record in this connection with the statement that, in my opinion, "breed is not so important as care" to make chickens pay. Nor do I believe that chickens of any kind are so profitable as some enthusiasts would have us believe. If properly managed along common-sense methods, however, I assume that poultry, like other stock well managed, will pay a reasonable profit and afford considerable pleasure to those who really like to have them about.

Notwithstanding that poultry breeding is "as old as the hills," there is yet a deal of ignorance concerning it. And this is true notwithstanding the untold thousands engaged in it and regardless of the fact that poultry shows are legion and the field is full of ably-conducted poultry publications. I believe, however, that this ignorance would be materially lessened if more poultrymen, both fanciers and others interested, would discuss through the various publications their views concerning the various phases of breeding, mating, feeding and so on.

I do not agree with Mr. Lawrey's opinion that the "Standard" could be dispensed with. I believe poultry shows are necessary and important and I believe that without an authority like the "Standard" they would be impossible. The fact that a good-laying fowl is disqualified at the show because it has certain defects is another matter entirely. If we have a "Standard" the poultry judge is bound to abide by it. Otherwise the whole matter of pure-bred poultry would be chaos. One can readily see that because a Plymouth Rock which proved to be a prolific layer was disqualified at the show because it had feathers on legs or toes, it does not follow that another bird equally perfect without said feather would not also be a prolific layer, while at the same time approaching nearer the ideal marked out by recognized authority.

If the Standard is faulty (and there is no question but that in some respects it might be) the remedy is to revise it in those sections where errors have crept in.

It is quite true that before the advent of the "Standard" and the poultry show we had good fowls, but in my opinion we have better, much better, now. Look at the record of the laying contests and of the records of individual flocks. A friend of mine once told me that the best-laying hens he ever owned were cross bred (half Leghorn-half Game), but this does not prove anything against pure-bred fowl or those that are bred to "Standard" points in a high degree. That perfection in the attributes of the hen has been brought about with great rapidity since the birth of the show and the Standard there can be no question. Without these the "fancy" would have been almost an unknown quantity and without the fancy what of the poultry journal? It is my opinion that these spreaders of poultry knowledge would have been few and far between. Of course, there would have been poultry—perhaps the Shanghai or the Indian Ghaga or Chittagong. But what were they as compared to our up-to-date Standard hen?

One thing I will admit and that is that so far as able fowl are concerned I do not believe the Standard has helped to that degree that it has in the perfection of perfect plumage and in the production of egg-producing qualities. In truth, the so-called Malay fowl of India was noted for its great meat qualities and solidity of flesh. The Cornish fowl which was evolved in Cornwall, England, gets its solidity of flesh from another non-standard Indian race, the Aseel, or fighting cock of the rajahs. But who would have known much about the Cornish fowl had it not been that it was made a Standard variety? Who in this country would have known much about the English Sussex fowl had it not been for the Standard? While the latter was able to win more than its share of prizes in the "dressed class" at the English shows and had long been one of the finest table fowls in Britain, it never became prominent until it was Standardized. Now it is bred to color and to a uniform type, retaining, I hope, the qualities that attracted the English fancy and caused it to become a "recognized" variety, and since which time I believe it has been improved as an egg producer.

While Mr. Lawrey discarded a host of varieties to take up the "Reds" and Wyandottes, there are doubtless plenty of other experienced poultrymen who have discarded the two and found some of the kinds he has discarded preferable. As stated, much depends upon condition, such as care, environment, feed and so on. The "keep" which is best for the Brahma is not necessarily best for the Leghorn. And yet the Leghorn is a "humdinger" for eggs if handled right.

Speaking of early laying pullets, I have a neighbor who has a number of pullets which are laying at less than five months of age, and I will say that these pullets are all standard bred birds of one of the well-known Mediterranean varieties. The important thing about this is that he is feeding the Cornell ration and his birds are of a noted "prize" show.

Viroqua, Wis. F. H. Graves.

Handling Poultry in Winter

To the Editor:—Every poultry raiser should put forth special efforts during the coming months to take especially good care of his poultry, not only for the sake of the present good prices of poultry, but in order to get all the eggs possible. Eggs are bound to be a good price all winter, and as they can take the place of meat, at the present very high price of meat, ought to be used more as a meat substitute.

The first thing in taking good care of poultry during the long, cold winter days is a good clean house with plenty of fresh air and exercise. Keep the hens busy, for a singing hen is a laying hen. They should have plenty of warm, clean water and that is hard to keep during the cold days, but a pail of warm water set upon a hot flat stone will keep warm most of the day. The air pressure tanks heated with coal oil are also good to keep the water warm and they also create a little heat in the poultry house. I always feed ear corn in the afternoon about three o'clock so they will have plenty of time to eat all they want before they go to roost. I also give them a mixture of whole grains, mostly oats this year, as everything else is so high, in the scratch room, giving plenty so they can begin scratching early in the morning. At noon I feed a hot mash of boiled potato parings and table scraps mixed moist with a mixture of bran, ground oats and middlings. I always keep pasteurized sour milk ahead of them instead of meat scraps, which I find is cheaper. They also have all the dry ground bone, oyster shells, fine charcoal and grit they want to help themselves to.

To keep your poultry in good health, you must keep a diligent watch and spray for lice and mites. I use blue ointment twice a year on mine and think a sawdust bath one of the best accessories to a poultry house. In the winter when the poultry are shut in, we have to strive to supply for them what they get in the warmer months, and as green food is a large part of their summer food, we must give them a substitute and I find there is nothing better than sprouted oats. Beets and cabbage are also good. It requires a great deal of hard work and care to keep poultry in good condition during the winter, but if you keep poultry, why not give them the care they deserve and they will repay you well. Mrs. Wm. O'Leary.

Honey Creek, Wisconsin.

How She Cares for Chicks.

To the Editor:—I saw an article in The Wisconsin Farmer asking ideas in making the most out of hens the year round. I started in last January, 1917, with twenty-four hens. I set six hens. Had mostly roosters and had ten laying hens and have got eggs every day since last January except two days, and my young May chickens have just commenced laying real well. We have twent-nine young and old to lay this winter. My experience in getting them to lay is this: First, a good, warm henhouse, plenty of sand and straw to scratch in and lime to eat and keep the nests clean with plenty of dry hay or straw. Give them plenty of clean water three times a day. Feed three times a day just lightly. In the morning give them cooked potatoes and wheat; shorts at noon or meat scraps; and at night, cooked corn or cracked corn. When I do not have wheat shorts to make a potato mash I use ground oats or soaked oats. I never give my chickens any cold water in the winter. My income from the eggs since last January, 1917, has been $53, but I expect $5 or $6 more by January, 1918.

I have sold $20 worth of chickens this year. I read all kinds of poultry books, but I take care of my own chickens in my own way. I do not let my chicks run out in stormy days and I feed them every day in the year. Now this is my experience one year with another. I never have had any disease among my chicks.

Family Circle Talks by the Publisher

(Continued from page 3.)

often as though it were some newly made discovery, some great truth which had just been brought to light. Here, for instance, to quote the latest expression which has come to my attention, is a portion of an article in the Philadelphia Public Ledger, written by Mr. Clarence Dubose, of Washington, D. C.:

American agriculture is the greatest potential power on earth today—for it is the indispensable force for the defeat of the Prussian war machine and the salvation of civilization. In the final analysis the winning of the war by America and the allies depends upon the efficiency of the American farms. If America fails in food production, munitions manufacture and military campaigns must also fail, for without food soldiers cannot fight or workmen perform their tasks.

We will win or we will lose this war in the grain fields, the potato patches, the pig pens, the chicken yards and the cattle and sheep pastures of the United States. Whether Prussianism shall perish or be perpetuated will be determined on the farm lands of America long before the final and decisive charge on the battlefields of Europe.

This is practically the same thing which you and I have been saying to each other for three years past, yet the eastern newspaper finds it so novel that it secures a two-column heading, as though it were equal, in news importance, to a victory for the allied arms in the field. Perhaps when the truth of the relationship of agriculture to military success is fully realized there will be such a change in the entire national policy toward the farmer as will insure him the labor supply which is absolutely necessary if full crops are to be raised next year and the next, and will save to the farm the farmer boys who are being drafted from the cornfields and feed lots to the various army camps.

I do not believe in assuming unduly an air of "I told you so," yet it gives me the greatest satisfaction imaginable to find such articles printed as the one I have reproduced herewith. We cannot fight with food alone, neither can we live on shells and ammunition. One is just as important as the other. Why not recognize this fact publicly and nationally and see to it that production is kept up to its present high standard, that it is increased rather than retarded? The farmer needs his boys and hands on the farm; their places cannot be filled by unskilled, inefficient labor from the city. When this fact is officially recognized a long step will have been taken toward winning the war.

A SOLDIER BOY'S ENDORSEMENT.

I AM glad, indeed, to find my stand on the war approved most heartily by a farm boy now serving Uncle Sam as a soldier at Deming, N. M., where so many thousands of the youth of the grain belt are securing the military instruction necessary before they embark for France. I am also glad to find my own opinion of the Young Men's Christian Association endorsed so heartily by a boy who has daily opportunity to appreciate the grand work being done by this organization. But let the farm boy soldier, Mr. Harold B. Fay, speak for himself:

Dear Mr. Pierce: A copy of your valuable paper, several weeks old, just came into my hands, and I was more than pleased to get it, as I had not seen one for over two months. The first thing I looked for, as I always did when home on the farm, was your page of personal views. I was more than interested in your article entitled "Farm Boys in Army Camps." I am a farm boy, a son of the soil, and am proud of the fact. Being a soldier, too, I agree with everything you said in your splendid article.

Through the columns of your paper I would like to thank the public for their contributions to the Army Y. M. C. A. fund. The Y. M. C. A. is doing a wonderful work in camp toward encouraging good morals, affording amusement and recreation for the boys and developing them physically, mentally and spiritually.

I, for one, hope you keep printing your views on current topics and your little sermons indefinitely, for they are doing more good than any words of mine could possibly tell. Again thanking you for your splendid articles and wishing all the farm folks back home success and happiness, I am,

Yours for Old Glory, HAROLD B. FAY.

I call that a splendid letter. Patriotism breathes through every line. It is such boys as this one—going from the farm to the training camp and from there to the field—who can be relied upon to carry Old Glory to complete victory and to make the world safe for democracy. How can any one think for a minute that the farmer is not patriotic, that he is not "doing his bit" to the very extreme of his ability, when a farm boy writes such a letter and shows such a magnificent spirit? I am proud, indeed, to be the recipient of such a letter.

We have been called upon, in recent months, to contribute to many funds; to the Red Cross, the Y. M. C. A., the Belgian Relief Commission, and so on and on. No one of these is more worthy than the Army Y. M. C. A. The green building or the green tent, with the red triangle marking it as the home of the Christian workers, is the only home which many of the boys in camp and field have; it takes the place of the old farm house to the boys who quit the furrow and the feed lot to bear arms for their country. We should be glad to have a chance to help such a worthy cause. The next time the solicitors ask for funds for the Army Y. M. C. A., remember the words of Harold B. Fay, farm boy and soldier, who can be relied upon to do his duty, however grim and tragic that duty may eventually prove to be.

James M. Pierce

International Short-horn Sale.

Fifty-two head of cattle for $56,725, an average of $1,091, a top bull at $9,000 and a top female at $4,800, tells in brief the story of the sale of Short-horns at Chicago December 6th, under the auspices of the American Short-horn Breeders' Association. The detailed report shows a wide distribution of the cattle and the prices paid is conclusive evidence of the stability of the trade. The top of the sale was $9,000 paid by Walter J. Hill, White Bear Lake, Minn., for the two-year-old Village Bud bull, Mount Victoria Stamp, by Glorious Dale consigned by Robert Crain, Mount Victoria, Md., and the top for females, $4,800, was paid by B. W. Aylor, Grandin, N. D., for the show and breeding cow, Verbena of Oakdale, by Maxwalton Sultan, with a ten-months heifer calf at foot by Prince Cumberland. This is the highest price ever paid at public sale b. an American breeder for a Scotch-bred cow. This pair was consigned to the sale by Eben E. Jones, Rockland, Wis. The Red Cross heifer, Red Cross Gloster, consigned by Carpenter & Ross, Mansfield, Ohio, for the benefit of the Red Cross, was purchased by Lespedeza Farm, Hickory Valley, Tenn., for $1,000 and Manager Scott announced that the heifer would be returned to the Short-horn Congress sale in Chicago in February and again sold for the benefit of the Red Cross. Col. Carey M. Jones did the selling in his usual effective way, assisted by Cols. Reppert and Kraschel. The list follows:

International Galloway Sale.

The American Galloway Breeders' Association held a successful sale at Chicago, December 6th, during International week, 20 head selling for $7,535, an average of $377. Fourteen bulls averaged $450. The top of the sale was $1,200, paid by Isaac Lincoln, Aberdeen, S. D., for the two-year-old bull, Picador, consigned by R. W. Brown. Col. Fred Reppert was the auctioneer. The list follows:

International Angus Sale.

The most successful sale of Aberdeen Angus cattle held in this country for years was that under the management of the Aberdeen Angus Breeders' Association at Chicago, December 5th, during the International, when 34 head sold for $34,175, an average of $1,005. There was a strong demand from all sections, the cattle were presented in fine condition, and the result of the sale should be a matter of gratification to every breeder of Angus cattle. The top of the sale was $3,050, this figure being reached twice, each time on a bull. L. R. Kershaw, Muskogee, Okla., paid that figure for the two-year-old Pride bull, Plowman, consigned by Ed Watkins & Son and the Blackbird bull, Ames Plantation Ito, consigned by Hobart Ames, went to C. D. & E. F. Caldwell, Burlington Junction, Mo. The top for females was $1,700, at which figure Dr. J. I. Huggins, Dandridge, Tenn., secured the two-year-old Blackcap 59th. B. C. Dove, of the Willow Lawn Cattle Co., Waverly, Iowa, paid $1,500 each for Momount Blackbird 9th, consigned by W. H. Cooper, and Blackbird Carrie, consigned by John Tudor & Son. A like price was paid by J. S. Caldwell, Chillicothe, Ohio, for Erica of Woodcote 18th, consigned by Dwight Cutler. Colonels Cooper and Reppert were the auctioneers. The detailed list follows:

FEMALES.

Blackcap 59th, calved 1915; Dr. J. I. Huggins, Dandridge, Tenn...$1,700
Emland Mabel 2d, calved 1916; C. W. Eckardt, New York 775

International Clydesdale Sale.

Forty-two head of Clydesdales, 18 stallions and 24 mares, were sold at Chicago, December 4th, during the International, the sale being under the management of Pres. R. B. Ogilvie, of the American Clydesdale Association. The demand was good and the average of $466 made on the entire offering represents a fair valuation, as there were a number of animals too young to sell to the best advantage. The top was $1,600, paid by Langwater Farms, North Easton, Mass., for the show mare, Buchlyvie Lady, consigned by McLay Bros. E. R. Williams, La Crosse, Wis., paid $1,000 for the outstanding three-year-old mare, Sweet Marie, consigned by Eben E. Jones. The top for a stallion was $1,000, G. W. Birney, Wyoming, Ill., giving that price for the good yearling, Proud Archer, consigned by H. Harris Ford. Colonels Jones and Reppert did the selling. The detailed list follows:

FEMALES.

Buchlyvie Lady, foaled 1912; Langwater Farms, North Easton, Mass. $1600
Hayfield Evangeline, foaled 1914; W. L. Houser, Mondovi Wis. 425

International Red Polled Sale.

Breeders of Red Polled cattle are to be congratulated on their excellent sale at Chicago, December 5th, during the International, 34 head selling for the excellent average of $440. The top of this sale was $2,300, paid by John Schmeising, Fort Doramer, Ohio, for the bull, Principal, while W. L. Hill, Alexandria, S. D., gave $2,000 for the bull, Billy Charmer. The top for females was $1,025, at which price Jean Duluth Farm, Duluth, Minn., secured the good cow, Susie 2d. The cattle were widely distributed, going to buyers from Wisconsin, Minnesota, South Dakota, Ohio, Iowa, Texas, Illinois, Nebraska. Col. Fred Reppert was the auctioneer.

Important Meetings Held.

International Officers Reëlected.

But one change was made in the directorate of the International Live Stock Exposition at the annual meeting held in the Saddle and Sirloin Club in connection with the International Show. All of the officers were reëlected. The new member of the board of directors is Jesse C. Andrews, of West Point, Indiana, one of the leading sheep men of the country and superintendent of the sheep division of the International this year. Mr. Andrews succeeds W. C. Brown, former president of the New York Central Railroad and now an Iowa farmer. The reëlected officers follow: President, Dr. G. Howard Davison, Millbrook, N. Y.; vice presidents, R. B. Ogilvie and Alvin H. Sanders; treasurer, O. T. Henkle, and secretary and manager, B. H. Heide. The directors reëlected follow: A. J. Lovejoy, Roscoe, Ill.; Edward F. Swift, Chicago; E. H. Ingwersen, Chicago; Fred Pabst, Oconomowoc, Wis.; O. E. Bradfute, Wilkes-Barre, Pa.; J. W. Martin, Gotham, Wis., and Robert Miller, Stouffville, Ont.

Short-horn Association.

At the annual meeting of the American Short-horn Breeders' Association, which was held last week, Mr. H. C. Lookabaugh, of Watonga, Okla., was elected to the directory board to succeed A. B. Patterson, of Meridian, Miss. Mr. N. H. Gentry, of Sedalia, Missouri, was elected to succeed himself, defeating his rival, Mr. W. A. Forsythe, of Greenwood, Missouri, by but six votes. Mr. Reed Carpenter, of Mansfield, Ohio, was unanimously elected to succeed himself. The newly elected directors will hold office for a period of three years. A different program was carried out at the annual meeting this year, the business session being preceded by a banquet at which some 265 breeders were present. Part of the session was devoted to the consideration of the accredited herd plan of dealing with tuberculosis, this being presented by Mr. H. O. Weaver, of Wapello, Iowa.

Berkshire Breeders.

A good attendance was present at the annual meeting of the American Berkshire Association held last week at the Stockyards Inn. A social hour was spent first, after which a business session was held. The election of officer resulted in the election of Prof. C. F. Curtiss, Ames, Iowa, president; N. H. Gentry, Sedalia, Mo., vice president; E. W. Smith, Springfield, Ill., treasurer, and Frank S. Springer, secretary. The new directors of the association are J. E. Dodge, Lowell, Mass., and Chas. M. Talmadge, of Newport, Washington. The matter of premiums at state fairs and expositions was referred to a committee and will be taken up later.

Where in **Western Canada** you can buy at from **$15. to $30. per acre good farm land** that will raise **20 to 45 bushels to the acre of $2. wheat**—it's easy to figure the profits. Many Western Canadian farmers (scores of them from the U. S.) have paid for their land from a single crop. Such an opportunity for **100% profit** on labor and investment is worth investigation. Canada extends to you a hearty invitation to settle on her

FREE Homestead Lands of 160 Acres Each

or secure some of the low priced lands in **Manitoba, Saskatchewan or Alberta.** Think **what you can make** with wheat at **$2. a bushel** and land so easy to get. Wonderful yields also of **Oats, Barley and Flax. Mixed Farming** and cattle raising. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature and particulars as to reduced railway rates to Supt. Immigration, Ottawa, Canada, or to

Duroc Swine Breeders.

There were about 100 members of the American Duroc Jersey Swine Breeders' Association gathered to attend a banquet and a business session last week. Among other things, a committee of seven members was named to go into conference at a future date with a similar committee from the National Duroc Jersey Record Association, Peoria, Illinois, to consider the consolidation of the two associations. The committee consists of the president, W. T. Harris, of Morganfield, Ky.; Ira Jackson, of Tippecanoe City, Okla.; Thos. Logan, Lafontaine, Ind.; Walter Williams, Marlow, Okla.; W. H. Peacock, Cochran, Ga.; Prof. H. W. Mumford, Urbana, Ill., and Sec. Robert Evans, Chicago. It was decided to increase the capital stock of the association from $25,000 to $50,000, as all of the present shares have been sold. The officers reelected or elected for the first time are Pres. W. T. Harris; vice president, C. E. Mahon, Osborn, Ohio; treasurer, Ira Jackson. Mr. Henry Matern, of Lostant, Ill., and C. E. Mahon, of Osborn, Ohio, were elected directors.

Galloway Breeders.

According to the report made last week by the American Galloway Breeders' Association by Sec. R. W. Brown, of Carrollton, Mo., the affairs of that association are in better condition than ever before. Twenty new members have joined the association during the last year and the shaggy coats were reported by Mr. Brown to be increasing in popularity. The election of officers resulted in the reëlection of G. E. Gilbert, of Wallace, Kan., as president, and R. W. Brown as secretary-treasurer. Mr. Lee W. Straub was chosen first vice president and H. Croft as second vice president. Mr. G. E. Clarke, of Topeka, Kan., succeeded himself on the board of directors, while J. F. Meserve, of Ellis, Kan., and G. A. Eger, of Hicksville, Ohio, were elected to fill the places of Messrs. Thompson and Chase, whose terms expire. The executive committee for next year will be Messrs. Gilbert, Clarke, Straub, Hechtner and Lincoln.

Percheron Society.

At the annual meeting of the Percheron Society of America, which was held at the Congress Hotel, December 3d, the affairs of this society were discussed somewhat in detail. According to the report read by Sec. Wayne Dinsmore, the society has now approximately 9,000 breeders enrolled and seven years ago it had 2,850. There is now a reserve fund of $106,000. There were 10,508 registrations made during the last fiscal year, of which number 10,314 were American bred. There were only sixty-four Percheron horses imported during the last year. The election of directors resulted in the choice of Mr. E. D. White, of Virginia; Mr. W. H. Butler, of Ohio, and H. J. McLaughlin, of Nebraska, these to act for the ensuing three years. The board of directors reëlected Mr. White president and Mr. W. S. Dunham, now serving as a captain in the United States army, was elected vice president. Mr. Wayne Dinsmore is continued as secretary.

Angus Breeders.

At the annual meeting of the American Aberdeen Angus Breeders' Association, held at the Palmer House last week, Mr. J. Garrett Tolan, of Farmingdale, Ill., was elected president; Father J. C. White, Winterset, Iowa, vice president; Chas. Gray, secretary, and J. D. Evans, treasurer. The newly elected directors of the association are D. K. Robertson, Madison, Neb.; A. B. Sawyer, Norborne, Mo., and A. A. Armstrong, Camargo, Ill. The holdover members of the board are Chas. Escher, Jr., Botna, Iowa; O. V. Battles, North Yakima, Wash.; Father J. C. White, Winterset, Iowa, and L. R. Kershaw, Muskogee, Okla. The stockholders of the association agreed on the expenditure of $13,000 on publicity during the coming year. The affairs of the association are in a flourishing condition, as indicated by the report of Secretary Gray.

Hampshire Breeders.

A well-attended meeting was held by the American Hampshire Swine Record Association and a movement was started to raise money for the purpose of erecting a new home at Peoria, Illinois. The members present contributed $2,000 as a nucleus for this fund. Officers of the association are: President, C. P. Paulson, Nora, Neb.; vice president, Stanley Morris, Fulton, S. D.; secretary-treasurer, E. C. Stone, Peoria, Illinois. The new directors are A. F. Silver, Cantril Iowa; John Wuicheto, Columbus, Ohio and W. Essig, Tipton, Ind.

In and Around Wisconsin

Racine county is one of the latest of Wisconsin counties to think of a county agent. No man has yet been found for the job, but it seems likely that Racine county will have a man in charge of this work by the time another crop season rolls around.

Farmers' week at the University Farm, St. Paul, Minn., will occur December 31st to January 5th. While this is chiefly a Minnesota meeting many of our northwestern Wisconsin farmers have found it profitable to attend, and have done so because the distance to St. Paul is small.

In ten years since Wisconsin passed the first stallion enrollment act, twenty-one states of the Union have copied the law. This is quite a compliment to Dr. A. S. Alexander, our well-known Badger authority on horses, who drew up the Wisconsin law, as a part of his work for the Wisconsin Department of Agriculture.

The state food administrator, Magnus Swenson, has condemned the policy of combination sales by grocers. Grocers are no longer permitted to sell sugar as a bait to get a large order of other groceries. The only exception is that sugar may be sold in combination with corn meal at the rate of one pound of sugar to one pound of corn meal. This is a conservation measure to try and save more wheat.

Word comes that Wisconsin cows are making a name for themselves in the Center Junction Cow-Testing Association, Jones county, Iowa. Of the ten high-producing cows in the Iowa association for October, nearly all were cows purchased in Wisconsin. No doubt if we could follow the records of many of our Badger cows which have been shipped to other we would have good reason to be proud.

According to federal statistics, this country imported from Europe ninety nine pounds of cheese in August, 1917, as compared to 63,800,000 pounds in August, 1914. Argentina, which imported no cheese to the United States in 1916, sent us 448,000 pounds in August, 1917. So far as Europe is concerned the cheese is going the other way. But the entrance of Argentina as a competitor in the American cheese trade is an entirely new and very interesting factor.

Since the recent visit of T. J. Newbill, of the boys' and girls' club movement in the United States, to Wisconsin, there is renewed interest in plans to get more boys and girls interested in farm work. Mr. Newbill says that this is no time for the number of students in the college of agriculture or the county agricultural schools to fall off. On the contrary, he says the enrollment at these colleges should be more than doubled to the end that more of our boys and girls who have not been familiar with farm work shall become properly prepared to take their place in the food armies of the nation. Mr. Newbill says that in Michigan there are now 30,000 boys and girls enrolled in club work and all of these young people are preparing themselves so that they can put in their best licks to increase production.

Two hundred stockmen were present recently at the first annual meeting of the Jackson County Live Stock Breeders' Association. Among the speakers were President Ristow, Mayor McGillivray, of Black River Falls; T. H. Campion, of La Crosse county; L. H. Robbins, county agent, and D. S. Bullock, of Madison. The association is growing in members and interest.

A report from Grant county says that W. J. Schreiner was on the Chicago market the last week in November with a consignment of 1,470-pound steers which sold at $14 per hundredweight straight. These are said to be the highest priced cattle ever sold out of Grant county on the Chicago market. The Wisconsin Farmer has no records to verify this claim, but we take it for granted the report is correct.

The pride of the One Hundred and Twenty-seventh Regiment, composed of Wisconsin men now in Waco, is "Old Woody," an eagle, which bids fair to have a career similar to that of "Old Abe," the famous Wisconsin war eagle of civil war days. The history of "Old Abe" is very familiar to readers of The Wisconsin Farmer. Sergeant Howe writes to friends at Madison that the eagle, though emblematic of Prussian militarism, as well as being our own national bird, is rarely seen in Germany, but that the members of the One Hundred and Twenty-seventh hope to have an opportunity to show the Germans in Berlin just what an eagle, captured in Wisconsin, really looks like. This bird, "Old Woody" was captured on a farm near Sun Prairie, Dane county, Wisconsin, and he was the center of attraction as the train of soldiers bearing Wisconsin National Guards passed through Baraboo, Madison, Janesville and Beloit last fall en route to Waco.

At a recent county agents' conference, held at Lancaster, Mr. Burlie Dobson, a successful hog breeder in Grant county, undertook to show how pork may be produced at a profit without feeding corn. Mr. Dobson's eleven-year-old son fed six pigs from July 1st to August 29th, for pig club contest. One of the conditions of the contest required that accurate accounts be kept of the gains in weight of the pigs, as well as the amount and kind of feed consumed. The important results of this boy's work are shown in the following statement:

July 1, 1917, 6 pigs weighed	530 lbs.
Aug. 29, 1917, 6 pigs weighed	1100 lbs.
Total gain in 60 days.....	570 lbs.
Gain per day of 6 pigs.....	9½ lbs.
570 pounds gain sold at $17.25 per cwt.	$98.32

COST OF FEED.

Oil meal, 150 lbs. at $2.50 cwt....	$ 3.85
Middlings, 1,000 lbs. at $2.50 cwt.	25.00
Mixed oats and barley ground, 1,200 lbs. at $2.50 cwt.....	30.00
Black Strap molasses, 5 gal. at 30c	1.50
Total cost of feed used.....	60.25
Net profit on 570 lbs. gain.....	38.07
Cost per 100 lbs. gain.....	10.57

These results show that during this period it cost about $1 per day to feed these six pigs, but that each dollar's worth of feed produced $1.63 worth of pork. In spite of the high feed prices of last summer, these pigs would have paid for their feed, if sold as low as $10.57 per hundred pounds. Many farmers should be able to raise hogs profitably by following similar methods of feeding.

The seed corn situation in Wisconsin is mentioned in the Seed Reporter, a leaflet published under direction of the secretary of agriculture. We quote from the Seed Reporter:

Wisconsin will require seed corn in all the northern part of the state, as the crop in this section was practically all killed by September and October frosts and freezing weather. The southern part of the state will have ample supply of seed for its own needs if picked and properly stored. It is believed that those farmers having corn suitable for seed are saving only enough for their own needs, when, as a patriotic duty they should be saving all they can possibly pick. Their own state needs all the Wisconsin corn available and it is likely to repay amply the farmers for any extra effort on their part in saving this much-needed extra supply. Wisconsin has suffered two corn failures in the past three years, thus thei rseed corn supply is about exhausted, and a large amount of Wisconsin corn, grown in Nebraska, will have to be substituted.

The same authority also discusses the clover seed movement as follows:

Wisconsin's clover seed crop of 1917 is about 75 per cent of normal, owing to the lateness of the first and second cuttings. About 10 per cent of the crop had moved from farms to storage points by the middle of October. Alsike is practically all hulled and 50 per cent is at storage points here and abroad. Acreage was less than in 1916, but yield per acre greater. Quality of red clover and alsike seed is very good. Prices, basis recleaned seed, range from $21 to $24 per hundredweight for red, $19 to $22 for alsike, $35 to $43 for white clover. Wisconsin dealers are not anxious to buy and store clover seed at prevailing high prices, but prefer to keep seed moving.

The government is asking an increase of 15 per cent in the number of hogs in the country just as quickly as the increase can be accomplished. Wisconsin is omitted from the published list asking for special increases. Iowa and Illinois are asked to increase the number of hogs 25 and 20 per cent respectively and Missouri is asked to make the increase 50 per cent. The main thing for Wisconsin seems to be to see to it that there is no loss and as much of a gain as can be made.

A NEW FARM FOR YOU

If you are a tenant farmer, or if you are tired of fighting climate handicaps in farming, here is your chance. You can buy, at low prices and on easy terms, a high, gently rolling farm with almost perfect natural drainage in the

HIGHLANDS OF LOUISIANA

ready to clear, plow and plant, where there is ample rainfall, healthful climate, mild winters, 9 months pasture each year—a natural corn and live stock country. Many other Nothern farmers now prospering there. Investigate for yourself! Get the big, new book of facts,

"Where Soil and Climate Are Never Idle,"

FREE if you send for it NOW!

Low rate excursions to the Highlands from nearly all points first and third Tuesdays of each month.

Long-Bell Farm Land Corporation
416 R. A. Long Bldg., Kansas City, Mo.

POULTRY AND SQUABS FOR PROFIT

Foy's big book tells all about it. Contains many colored plates—an encyclopedia of poultry information, written by a man who knows, mailed for 5 cents. Low prices, fowls and eggs.

FRANK FOY, Box 82, CLINTON, IOWA

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

POULTRY AND PET STOCK.

BARRED PLYMOUTH ROCKS and Buff Orpington ducks; Chicago winners; great layers; established 1892; eggs for hatching: $1.50, 15; $4.50, 50; $8, 100; prompt delivery and good hatch guaranteed. G. Earl Hoover, R. 24, Matthews, Ind.

THE MAIN POULTRY YARDS—Breeder of Barred and White Rocks; selling out, everything goes, including prizewinners. Pullets, hens, cockerels, cocks—either sex. For quick sales. John Maas, Hartford, Wis.

HATCHING EGGS; prize-winning S. C. Reds, White Wyandottes, Buff Orpingtons, S. C. White and Brown Leghorns, $1.50 per 15. Ledge View Poultry Farms, Box W. F., Fond du Lac, Wis.

SINGLE COMB RHODE ISLAND RED cocks and cockerels. Single Comb Ancona cockerels, White Indian Runner drakes. Prices right. Address Mrs. Wm. O'Leary, Honey Creek, Wis.

CHILCOTE STRAIN S. C. Brown Leghorns. Increase your egg yield by purchasing my bred-to-lay Stalk cockerels, $1 each, while they last. Frank Chilcote, Washington, Iowa.

HATCHING EGGS—S. C. Reds, prize-winners all leading shows. Eggs, $1.50, 15; $8, 100. Order from this ad. Address C. L. Pre-Fontaine, Box 600, Fond du Lac, Wisconsin.

RHODE ISLAND REDS—Setting of 15 eggs from pure-bred prize-winning Rhode Island Reds, $2 per setting; three settings for $5. Hildebrandt & Vea, Stoughton, Wis.

GOLDEN WYANDOTTE COCKERELS—Beautiful birds, $3.00 each; satisfaction guaranteed. Geo. J. Hilst, Green Valley, Ill.

FOX HOUNDS—Field trial winners and guaranteed to be as recommended. Miller's Kennel, Wilton, Wis. Stamps for reply.

WHITE WYANDOTTE COCKERELS—$1.50 each. Columbia County Asylum, Wyocena, Wis.

WHITE LEGHORNS—Price reasonable. Wright Bros., Garden Prairie, Ill.

MAMMOTH BRONZE TURKEYS—Mrs. Marcus Hanson, Westby, Wis.

PRINTING.

PRINTING—Special offer: 200 noteheads, 200 envelopes and 200 cards delivered for $4.00. Samples free. Write for prices on sale catalogs. LIVE STOCK PRINTING CO., LaGrange, Ill.

GOVERNMENT POSITIONS.

MEN, WOMEN WANTED—$90 month; government positions; hundreds vacancies; list positions free. Write immediately. Franklin Institute, Dept. K176, Rochester, N. Y.

FANNING MILLS.

GET PRICES on Owens fanning mills, grain graders, corn graders, before you buy. All sizes on hand. J. L. Owens Company, 1199 Superior St. S. E., Minneapolis, Minn.

TANNING.

LET US TAN YOUR HIDE—Cow, horse or calf skins for coat or robe. Catalog on request. The Crosby Frisian Fur Co., Rochester, N. Y.

REGISTERED HOLSTEIN BULLS.

REGISTERED Holstein bull, ready for service. A beauty. Two of his dams averaged 106.75 lbs. milk 1 day; one made 44.18 lbs. and 4 averaged 37.52 lbs. butter in 7 days, officially. $200. Wisconsin Live Stock Association, Appleton, Wis.

REGISTERED GUERNSEYS.

REGISTERED GUERNSEYS FOR SALE—Mature cows, young cows, bred heifers, bulls all ages, reasonable. Would take good clover hay as part or full payment. Wyndham Farm, Fond du Lac, Duluth, Minn.

HEIFERS AND STEERS.

FOR SALE—32 head heifers and steers, coming two; $45 each, f. o. b. here. C. C. Lyford, Wauzeka, Wis.

FARM LANDS.

GO WHERE LAND IS LOW PRICED—Last year we urged some of our investor friends to purchase certain farm lands in Eastern Oklahoma which were then offered at from $35.00 to $50.00 per acre. Many of these farms in 1917 earned for their owners several times the cost per acre in 1916. We still have a few farms listed for sale at very attractive prices. They are worthy of the consideration of any man who wants to buy a farm. We do not own these lands but with a view to increasing the number of farmers along our railroad, and thereby building up our freight territory, we have interested ourselves in the matter of distributing information in territory where we know there are good farmers, hoping that we can move some of them into eastern Oklahoma. We do not charge anything for our services. We will be well repaid if our territory is built up by the removal thereto of a number of men who know how to farm. If you are interested in a farm in eastern Oklahoma, of the kind referred to above, write me for particulars. R. W. Hockaday, Industrial Commissioner, M., K. & T. Ry., 1505 Railway Exchange Bldg., St. Louis, Mo.

FARM FOR SALE—One of the best dairy and grain farms in Dodge county is now for sale. This place, known as the Cutler farm, is in the garden spot of the state, situated 4 miles east of Beaver Dam and 1½ miles west of Rolling Prairie station on the Watertown and Fox Lake road. It contains about 200 acres, 140 under high state of cultivation, balance first-class pasture land. Sufficient pasturage for 50 cows. Running spring water. Good buildings, including residence for tenant. New barn 100x40 feet, strictly modern, specially designed for dairy. New silo 41 feet high, 16 feet in diameter, connecting with barn. Enough timber on the place for fuel. Deep black soil. Very productive. Inquire at premises or address W. W. Cutler, R. 2, Beaver Dam, Wis.

REAL SHEEP PROPOSITIONS—626½ acres good grazing and agricultural land, a grade retailing at $20 per acre, joining two fine lakes; sufficient food for 6,000 sheep. One mile railroad station, N. W. line. Price $10.50. 480 acres splendid agricultural land, well adapted for sheep raising, with fine trout stream, 1 mile from railroad village. Price $11. 440 acres specially good agricultural land, high, dry land, with deeply imbedded stream; similar land retails at $30 per acre and more. 4 miles from railroad. Price $12.50 per acre. Larger tracts of grazing land at proportionately lower prices. The E. L. C. Co., G-M. Dept. 10, Merrill, Wis.

A SMALL CALIFORNIA FARM earns more money with less work. Raise crops you know: alfalfa, wheat, barley; also oranges, grapes, olives, figs. Ideal for dairying, pigs, chickens. No cold weather; rich soil; low prices; easy terms; good roads, schools, churches. Enjoy life here. Write for our San Joaquin Valley, Dairying, Poultry Raising, Illustrated Folders, free. C. L. Seagrave, Industrial Commissioner, Santa Fe Ry., 1959 Railway Exchange, Chicago.

CHOICE BARGAINS—80 acres, gently sloping, 60 acres cleared, good buildings; 4 miles from town; stock, machinery and crops included, $4,200. 120 acres, fair buildings, good timber, $1,700. 80 acres, 25 acres free of stumps, log buildings, $1,400. 40 acres, 15 acres cleared, good log buildings, $1,100. Cut-over land, $10 to $20 per acre. All descriptions have productive clay soil. Write for details to The E. L. C. Co., F-M., Dept. 10, Merrill, Wis.

560 ACRES—14 miles from town; all fenced, running water; 160 broke; $10. $3,200 cash, or part trade, for cattle and young mares, balance to suit, 8 per cent; mean business. One 540-egg Berry's Biddy incubator, made one successful hatch, works good; price $30; December prices. Pure-bred cockerels, two Black and one White Langshans, 1 Black Orpington, $2.00 each, December prices. Fred Franzen, Sentinel Butte, N. D.

LANDOLOGY, a magazine giving the facts in regard to the land situation. Three months' subscription FREE. If for a home or as an investment you are thinking of buying good farm lands, simply write me a letter and say, "Mail me LANDOLOGY and all particulars FREE." Address Editor, Landology, Skidmore Land Co., 310 Skidmore Bldg., Marinette, Wis.

WISCONSIN LAND, just over the river from Iowa. Smooth drained land at half price. 520 A., 5 m. from Grand River, Ia., $50 per A., good stock proposition. Will trade 255 A. in No. Mo., Schuyler Co., for live stock. Girton & Lyons, 705 Crocker Bldg., Des Moines, Iowa.

80 ACRES, 4 cows, 2 horses, new wagon, mower and hay rake, harness, buggy, chickens, furniture, good buildings and well. Pierce county, Wis. All for $3,800. Herbert, R. 2, Box 15, Red Wing, Minn.

WOULD YOU SELL YOUR FARM if you got your price? Sell direct. No commissions. Particulars free. Charles Renich, G-2, Woodstock, Illinois.

FOR RENT ON SHARES—120-acre dairy farm. Good chance for honest, sober man with help of his own. Inquire W. A. Canniff, Juneau, Wis.

TWO FARMS FOR SALE—Near town, school, etc. Will rent one to right party. H. V. Peoples, Ladysmith, Wis.

80 ACRES—All tillable, improved, to be sold before January 1. Write Phil Barnes, Hancock, Wisconsin.

WANTED—To hear from owner of farm or unimproved land for sale. O. K. Hawley, Baldwin, Wis.

FARMS FOR SALE—Address Reuben M. Ellerd, Box 6, Plainview, Texas, owner.

SEED CORN.

SEED CORN—Northwestern Iowa grown seed corn, high-testing, fine quality, crop of 1916. Varieties: Reid's Yellow Dent, Wimple's Yellow Dent, Dakota Gold Mine, Silver King. Also Early White Dent, Minn. 13, Pride of the North, 1917. Fancy ear seed in boxes, $7 per bushel. Graded shelled seed, $6 per bushel. Guaranteed to test satisfactorily or money back and freight paid both ways. L. N. CRILL SEED COMPANY, Westgate, Iowa.

SALESMEN WANTED.

SALESMEN WANTED—Owing to conditions brought about by the war we have a few well-worked territories open and will be pleased to hear from interested persons. Applicant must be exempt from draft. McConnon & Company, Dept. T, Winona, Minn.

MONEY TO LOAN.

MONEY TO LOAN on Wisconsin farms in amounts of $5,000 to $25,000. Security must be twice the amount of the mortgage. 6% with privilege of paying $100 or more at any time. Address 206 Washington Bldg., Madison, Wisconsin.

UPPER WISCONSIN

Placing Hogs Along the Soo Line

The Soo railroad which covers a vast portion of Wisconsin's undeveloped northlands has been behind every movement which has had for its object the advancement of agriculture in northern Wisconsin. The road has been one of the most active spirits to get the Land-Clearing Specials started. One of the prime objects of the Soo Line in doing extension work in agriculture has been to give farming in northern counties a good start, for the sooner the farm products of grain and live stock begin to be marketed by northern farmers the sooner will the road receive profits from the investment in rolling stock, land and equipment.

The latest move of this railroad has just finished the first stage of what is hoped to become one of the leading future enterprises of northern Wisconsin. The company has just arranged for the placing of over 600 pure-bred hogs on farms along this line. Through the bankers of the small towns which were visited the financial arrangements were accomplished without undue trouble and more than 200 farmers were assured of a fair chance of breaking into the hog-raising business under fair conditions.

The Soo Line Hog Special started its trip at Chippewa Falls on October 21st and finished on November 15th. On the team were the men who planned the trip, officials of the road and the men to furnish the pigs. In a special car six Duroc Jersey sows and five boars of the same breed were carried as examples of what big-type Duroc Jerseys should look like. At each town moving pictures showing how the hogs are to be handled were shown and a lecture on what is possible and impossible in hog raising followed. The orders for the pigs were taken for June and May delivery. Only trios, consisting of two gilts and one boar, were contracted for, to be delivered at ten weeks of age. The pigs will be delivered at that time by special train covering the same route as the extension train.

Crowds of 100 to 500 farmers came out at each stop, but in most places others were strictly limited to five trios for a town, as the officials recognized the danger of overdoing the good work in any community. The pigs are not to be paid for until one year is up and there will be no interest charge on the notes. The bankers recommended the purchases and handled the notes. The Soo Line assists the bankers to offer this free arrangement and only asks that the pigs be raised right.

The Duroc hogs secured for illustration purposes on the special train were pure-bred stock from the L. F. Atwater farm, La Crosse county, Wisconsin. The special train, above referred to, started from Chippewa Falls and made the trip over the Chicago division to Spencer and thence north to Philips and from Manistique, Michigan, back to Ladysmith, then to Rice Lake, Osceola, Frederick and back to Chippewa Falls.

A year ago officials of the Soo Line started out to make an investigation of various herds and they finally decided to pick Durocs for Upper Wisconsin distribution. After looking over a number of Duroc herds they picked upon Mr. Atwater's as being most to their liking and they made a final decision upon the showing made by Mr Atwater's herd at the Minnesota State Fair, 1917.

It will certainly be a fine thing for Upper Wisconsin if a number of farmers can get well started in the pig business and this is especially true when we consider what a good type of breeding stock they are getting from the Atwater herd.

Potato Experience in Vilas County

Potatoes are fast assuming a recognized place of dependence in the northern farmer's scheme of living, according to evidence brought out at the recent state potato show.

One of the striking examples of what potatoes mean to northern settlers of Wisconsin was told by Oscar Gunderson, county representative of Vilas county, regarding the potato crop raised this year by one of his constituents, Lewis Grenier, of Arbor Vitae. Mr. Grenier was present at the interview with Mr. Gunderson and at the close of the talk showed a bank check for a comfortable sum as evidence that the deal discussed was exactly as represented.

It seems that Mr. Grenier harvested 7,500 bushels of Green Mountains on thirty-six acres of land on his farm just adjoining six forties owned by the forest reserve. These potatoes were sold for good prices—sums running from $1 to $1.30 a bushel.

Two years ago most of this land on which the tubers were raised was in the usual cut-over condition. By hiring Indian labor and doing long hours himself, Mr. Grenier managed to clear fifty-four acres for about $700, using stumping machines almost exclusively.

In the spring of 1916 the most of this tract was sowed to oats, and then seeded to clover. This was then plowed under in the fall and potatoes were planted on the land this summer. The yield and quality has been exceptional and Mr. Grenier helped put the Vilas county booth well toward the front rank in the state contest by his exhibit of Green Mountains.

In Calumet County.

To the Editor:—Mr. John P. Koehler had the highest cow for the month of November. It is a grade Guernsey producing 1,182 pounds of milk and 61.46 pounds of fat. The forty-five-pound list is as follows:

Owner, name and breed.	Age.	When fresh.	Lbs. milk.	P.C. fat.	Lbs. b'fat.
Frank Sontag

JESSE WOLF, Official Tester,
Chilton Cow-Testing Association,
Chilton, Wis.

The United States Sugar Refining Company's plant at Madison expects to market about 6,000,000 pounds of sugar this year, this being a gain of 33 1-3 per cent over the production of 1916. Mr. R. Zieske, superintendent of the Madison plant, says there is no cause for prejudice against beet sugar in favor of cane sugar. He insists that beet sugar with impurities eliminated is just as good as cane sugar. In fact, the best judges of sugar often make a mistake in selecting beet or cane sugar when the two are placed together.

SALE DATES.

Duroc Jersey Swine.

Jan. 8, Johnson Bros., Winnebago, Minn.
Jan. 10, W. N. Shanks, Worthington, Minn.

Live Stock and Commercial Notes.

Gathered by Representatives of The Wisconsin Farmer.

Minnesota Short-horn Breeders' Second Sale.

ON January 4th and 5th the Minnesota Short-horn Breeders will hold their second annual sale at the South St. Paul Stockyards. For this event 86 head have been listed, about an equal number of males and females. Last year's sale was a success beyond expectation and a better lot of cattle have been listed this year. The breeders have learned that good cattle are appreciated and an association sale is not the place to sell the "tail ends." Every animal in this sale has been inspected by the sale committee, and the quality and individuality is assured. The show which will be held on the first day will afford an educational value to those who attend. For this event the services of secretary F. W. Harding have been secured and he will judge the cattle. The showing will start at 10 a. m., January 4th. In the evening following the show the annual meeting and banquet will be held in the St. Paul Commercial Club rooms. A most enjoyable evening was spent at the banquet last year and a better program has been arranged this year. Commencing at 10 o'clock a. m., January 5th, the sale will be opened by the auctioneer, H. O. Tellier. Wisconsin Short-horn men can well afford to attend this show and sale. Some of the best herds in the Northwest are to be found in the state of Minnesota and cattle from these herds have been listed in this sale. The cattle have all been tested and are guaranteed in every way. The catalog is very interesting and can be had for the asking. P. C. Jordan is secretary of this association and should be addressed at Morris, Minn., for a catalog. Don't forget the date and place of the show and sale.—Adv.

At H. H. Smith's, Baraboo.

A WISCONSIN FARMER field man recently had a very pleasant surprise when he saw the H. H. Smith herd of Poland Chinas at Baraboo, Wis. There is no reason why Mr. Smith should not have Polands as good as anyone, but we were not posted as to what he had. Just now Mr. Smith has a few extra good spring boars—the big kind, with lots of quality, good feet and pasterns and they will please. They are sired by King Wonder, a yearling by Great Wonder, he by A Wonder 107353. The dam is by A Wonder 143421, a great combination of big-type breeding. The young boar in the herd is sired by that good Martiny boar, Big Bone Wonder, said by many to be the best aged breeding boar in the state. The dam of this boar is by Smooth Big Bone, so Mr. Smith has the breeding backed up with individuality that should produce results. One of the good yearling sows in this herd is sired by Black Jumbo 2d by Maid's Halvor by Big Halvor; her dam by Mabel's Wonder. Another good sow is by Big Bug out of a Chief Price 2d bred dam. There are also yearlings sired by Mollie Jones' Lad, he by Big Tom out of a dam by Big Jones. The breeding is the very best known to the big-type fraternity. Besides the spring boars, a nice lot of fall pigs are running around the farm and these are for sale at very reasonable figures. See advertisement on page 29 and write H. H. Smith, and tell him your wants.—Adv.

Shea Buys Excellent Boar.

DENNIS SHEA, Melvina, Wis., continues to add good things to his Duroc herd as fast as he can find them. The most recent addition, and the attraction on his farm at the present time, is a yearling boar recently purchased in the east, a son of Taxpayer Model, he by Taxpayer by Morton's Top Col.; dam by Pal's Col. by Premier Col., she out of a Fancy Col. dam. Taxpayer's Model was a grand champion boar at the southern fairs and is now owned by Coldstream Farms. A litter sister to the Shea boar was grand champion sow at the Ohio State Fair this fall. This boar is big, has an ideal back, head and ear, feet and pasterns that are correct; in all a boar worthy to stand at the head of the Shea herd. This boar, together with Col's Choice, the best King the Col. boar in the state, and Pathfinder 2d, a son of Pathfinder, will make the trio of herd sires. Shea has a great lot of high up, stretchy gilts and they should make some sale offering on January 29th. A few real good boars are found on this farm for the late trade. Don't forget the Shea sale—it will be one of the best of the winter sales. Details will appear later.—Adv.

Last Call for Arnold Sale of Short-horns.

THIS is the last opportunity we have of calling your attention to the 65 head of Short-horn cows, heifers and bulls that are to be sold by A. W. Arnold at his farm adjoining Galesville, Wis., on December 20th. Mr. Arnold is selling a good, useful lot of cows and heifers and if you are in need of a few of this breed you will find what you want in this sale. Some 15 head will sell with calves at foot and bred again. Some good useful young bulls of serviceable age will be sold. Everything has been tested and a clean bill of health goes with every animal sold. Galesville is on the Wisconsin side of the river between La Crosse, Wis., and Winona, Minn. The railroad service to and from the sale is good. If you have not received the catalog, write for it at once and please mention The Wisconsin Farmer.—Adv.

Sending Holstein Stock to the Southwest.

THAT there is a great demand for Wisconsin dairy stock, especially of the Holstein breed in Kansas and other southwestern states, is forcibly illustrated by the recent visit to Wisconsin of Mr. Fisk, of Leavenworth. Mr. Fisk bought 101 head of pure-bred cattle at an average of $335 per head. These cattle have been shipped to the Fort Leavenworth tract, a large body of land under the supervision of the government and managed by Mr. Fisk, formerly general manager of the Fred Pabst Stock Farm. Milk from the cows purchased is to be used by the United States government and the herd will be cared for by the Fort Leavenworth prisoners directed by competent men. While in Wisconsin making his purchases Mr. Fisk was materially aided by S. E. Jones, the well-known Watertown breeder, who is an excellent judge of stock and has had a lifetime experience in handling Holsteins. It is not surprising that Mr. Jones was able to secure for Mr. Fisk such a splendid shipment of Holsteins. To head this splendid herd a 30-pound bull was purchased from Fred Pabst, also a son of Pietertje Maid Ormsby and another 30-pound bull from John Irwin, of Minneapolis, Minn. Mr. Jones also sold for this shipment three daughters of Canary Paul Homestead, having records ranging from 18-pound two year olds to 25-pound three year olds. The writer recently accepted the invitation of Mr. Jones to visit his farm two miles from Watertown and see Jessie Fobes 2d Maude Homestead, the famous daughter of Homestead Junior De Kol and one of the living evidences of the superiority of this great sire. She is not only a large individual, possessing practically all of the desirable points in the Holstein conformation, but has already two records recorded above 30 pounds. At five years of age she made 31.17 pounds of butter, 746.90 pounds milk in seven days; 123.54 pounds butter, 2,993.70 pounds milk in 30 days. At seven years she made better than a 30-pound record and 738 pounds milk. At three years she produced 20.05 pounds butter and 660.10 pounds milk, which was the world's record when made. A son of this well-known cow sired by Canary Paul Fobes Homestead, that has more than 23 A. R. O. daughters, is now junior herd sire of Mr. Jones' herd. One of the remarkable records of this cow is that her two seven days' records averaged 742.45 pounds milk, which is considerably above 100 pounds of milk per day. Her 30-pound record was also made with practically an average of 100 pounds of milk per day.—Adv.

Babcock's New Herd Boar.

B. H. BABCOCK, Evansville, Wis., who owns one of the good Chester White herds in the state, has just sent us the breeding of the boar that he is using in his herd this fall. The good gilts that sell in his February 19th sale will be bred to this boar and a son of the grand champion, Pay Streak. Babcock has named this new boar, Hoover. He is sired by Wm.'s Goods, he by the world's champion, William A. The dam is by J. V.'s Perfection, and was second prize senior yearling at Omaha in 1916. A brother to Hoover was first-prize "under six months" at Omaha this fall, and was junior champion. No Chester White breeder in the state has a better bred boar and sows and gilts bred to him should be in demand this winter.—Adv.

Little Offers Bulls for Sale.

HARVEY H. LITTLE, the man of milking Short-horn fame, Evansville, Wis., has three bulls of serviceable age that should go to a herd where they want bulls that have the backing to produce results. One of these bulls, a roan, is just passed a year old. His dam has just finished her year's work and gave 10,600 pounds of milk, her dam gave 10,115. Remember that these records were made under ordinary conditions, no forced feeding at all. This bull is sired by a straight Scotch bull, out of a milking bred dam, so if wanting combination of milk production and beef qualities, this fellow will give satisfaction. Another bull of serviceable age, bred similar to the one men-

Poland Boars for Farmers

HAVE A FEW smooth, good-footed spring boars for sale. They are big and of choicest breeding. GUARANTEED in every way. Also have a nice assortment of fall pigs—boars and gilts—and will price trios so as to interest you. I HAVE POLANDS TO SELL AND THEY ARE PRICED ACCORDINGLY. Try me.
H. H. SMITH BARABOO, WISCONSIN

tioned above and out of a cow that has averaged 8,000 pounds of milk for four consecutive years, is a good buy. A rcan yearling is being offered that is out of a dam that Mr. Little sold to a Washington party. He is sired by a milking-bred bull that is out of a 7,000-pound three year old and backed up for several generations with the very best milk records. These bulls are in nice condition and the Little guarantee goes with every animal sold. It will pay you to investigate this offer. In writing for further information kindly mention The Wisconsin Farmer. See advertisement on this page.—Adv.

J. C. Hendricks' Sale Offering.

J. C. HENDRICKS, the Poland China wizard of Wisconsin, writes, giving the weights of some of the gilts that go in his February 12th sow sale. These gilts were weighed November 28th. Three Orphan Big Joe gilts weigh 310, 315, 325 pounds. This is the boar that Overton sold for $1,000 at the Iowa State Fair. Six by Northside Wonder averaged 318 pounds; one by Orange Boy weighed 315; two by Smooth Price weighed 300 and 312; two by Black Chief, one weighed 320 and one 317; two by the well-known Orange Wonder, weighed 305 and 310; two Model Major 2d gilts averaged 305 pounds. Space will not permit us to give the weights of all the 40 gilts that go in this sale. Those mentioned were farrowed between the first and 25th of March. Mr. Hendricks writes that they have had no corn, being fed "slop," oats, tankage and plenty of "scenery." These gilts have been bred for March farrow to Ring Leader, said by breeders who are in a position to know, to be one of the greatest breeding boars living. He is the highest priced Poland China boar ever brought to Wisconsin. Wisconsin Orange is also in service. He is a big yearling son of Orange Boy out of a Big Victor dam. Big Disturber is a 1,200-pound prospect and is sired by the $1,500 Disturber. Giant Wonder was the best fall boar R. M. Cassell raised last year and is sired by Giant Leader out of an A Wonder dam. This boar is a wonder and we expect to see him out next year. We predict that Mr. Hendricks will have the greatest lot of gilts ever driven through a sale ring in the Northwest. Send name now for catalog. Remember that he holds the state record for Polands. Don't forget the date.—Adv.

$400 Will Buy a 31-Pound Holstein Bull

SIRE a 30-lb son of Sir Beets Cornucopia Netherland 38460. Dam, Ella Mercedes of Elm Count. Butter, 31.02 lbs. 7 days; 829.78 lbs. one year. He was born Feb. 24, 1917, and is a nice, straight fellow. This is a bargain. Act quick if you want him.

BROOKVALE FARMS
Howell & Gerrit Waukesha, Wis.

DUROCS ON APPROVAL

BOARS weighing from 200 to 250 pounds, extra good. You see your boar before you pay. Satisfaction or no sale. Could make you no better proposition. Order one. Gilts all sold.
FRED G. MATTHES Viola, Wis.

Pabst Bull Calves Popular.

PABST quality bull calves are growing in popularity with southern breeders almost daily. Hardly a day passes but what the Pabst Stock Farm receives inquiries from the South relative to bull calves. One of the most recent purchasers from the sunny south was R. S. Hynson, Manassas, Va. He purchased Pabst Maplecrest Korndye, a young son of Korndyke Segis Johanna, from a daughter of Maple crest King De Kol, the second dam by King Pontiac Champion. Korndyke Segis Johanna is too young to have any tested daughters, but in point of breeding he runs with the best. In public sale he brought $12,500. Pabst Maplecrest Korndyke is a beautiful individual, splendidly marked, and as is true with all this line of breeding considerably more white than black.—Adv.

GUERNSEY CATTLE.

BROAD RIPPLE GUERNSEY FARMS

WE ARE NOW OFFERING for sale Broad Ripple Monarch, a beautiful individual, out of a dam, 11 months on test, that should finish well over 600 lbs., and Broad Ripple Harvard King, whose dam has just finished with 500 lbs. She is a granddaughter of Masher and the calf's sire is a grandson of King of the May.
GEO. W. BROWNE, Prop. :: :: :: Waukesha, Wis.

JEFFERSON COUNTY GUERNSEY BREEDERS' ASSOCIATION

RUST BROS.

OFFER the richly bred Holstein bull, Sir Isa Lotta Hengerveld 188663, born Aug. 18, 1915. Ready for service. His dam, Ida Lotta Hengerveld, at 3½ years made 21.34 lbs. of butter in 7 days, 31 days after calving. She is from a long line of heavy producing ancestors, records of her three nearest dams averaging 27.20 lbs. butter in 7 days. She has inherited this heavy producing ability, and transmits it. Sire of bull for sale is Daisy Johanna 5th, 1st prize two year old at Wisconsin State Fair, 1915. His dam has two A. R. O. daughters. Arthur Rust, West Allis, Wis.

Holsteins

WE ARE OFFERING at present two young sons of Sir Ormsby Johanna De Kol 37TH (141165) and cow. Also can spare two or three heifers from six to nine months of age.
F. A. SWOBODA East Troy, Wis.

THE WISCONSIN FARMER

VOL. XLVI. NO. 51. THURSDAY, DECEMBER 20, 1917. WHOLE NO. 1873

GET INTO THE ALFALFA BUSINESS

By L. F. Graber, Secretary Wisconsin Alfalfa Order.

DON'T take any chances on growing alfalfa. Play the game sure. Give alfalfa a square deal and it will treat you doubly square. And it pays to be square with alfalfa, even though it costs extra. Just think of it! Is it not worth while to get into the game when alfalfa hay is worth from $35.00 to $40.00 a ton? Can we afford as a general proposition throughout the southern part of the state, to put in our time, money and energy on a crop that does not produce any more for our efforts than does timothy? Yet Uncle Sam tells us that eight years ago Wisconsin was growing 767,000 acres of pure timothy against 18,000 acres of pure alfalfa and 119,500 acres of pure clover. But we have done better since then. It is safe to say that there are no less than 80,000 acres in Wisconsin today. Alfalfa is coming fast. Get into the game. "Slow but sure" is the motto that leads to success with alfalfa, and such success is worth while.

Not one word against our old friend and standby, red clover. Only this—in many places alfalfa is even superior in quality and yields to clover. But in some sections, particularly in northern Wisconsin where clover grows like a weed and a stand is so easily secured and bounteous yields of this great crop can be cheaply and readily obtained, alfalfa should not be too strongly emphasized, especially if its establishment is difficult, costly and uncertain.

What I have to say in this article is a summary of the experiences of over 1,000 growers of alfalfa in Wisconsin who are members of our alfalfa association, The Alfalfa Order. This article is meant particularly for those who are beginners and for those who have failed with alfalfa. Success with alfalfa is practically assured when your soil—

(1) has plenty of lime in it;
(2) is inoculated;
(3) is sloping and has good drainage;
(4) is reasonably fertile and manured;
(5) is prepared carefully so as to furnish a firm seed bed;

and when your alfalfa is seeded—

(1) with only one bushel of grain as a nurse crop;
(2) with oats cut for hay to prevent overcrowding of the alfalfa plants and too much drying out of the soil as may occur with any late-ripening grain crop (barley matures early and may be cut for grain);
(3) at the rate of 15 to 20 pounds of good hardy seed an acre;
(4) not later than July 15th when alfalfa is started without a nurse crop.

These are the big essentials of alfalfa growing put up in a nutshell. If you want to keep a good stand after you once have it—

(1) use hardy Grimm, Baltic or Cossack alfalfa seed where winterkilling is a serious problem;
(2) do not cut or pasture your alfalfa after the first week in September, even though you only get two crops a year;
(3 avoid putting on manure until after the alfalfa is one year old.

The most vital need of Wisconsin soils for the growing of alfalfa is lime. There is no crop grown in this state that needs as much lime—that must have this lime for successful growth as does alfalfa. Not all soils need extra lime—they may be well supplied but where alfalfa is a continued failure—ninety times out of a hundred the failure is due to a lack of lime in the surface eight inches of soil.

FROM RIGHT TO LEFT THE FIRST TWO ROWS ARE COMMON MONTANA ALFALFA, THREE YEARS OLD, AND BADLY WINTERKILLED. THE NEXT ROW IS THE GRIMM, THICK AND VIGOROUS IN SPITE OF THREE SEVERE WINTERS.

Here is an instance where a macadamized road demonstrated what lime would do for alfalfa. There was about ten acres which had been seeded the previous year on a sloping, well-drained field. The soil was of limestone origin, fertile and well inoculated, as indicated by the presence of nodules on the alfalfa roots. All along the road adjacent to the field sweet clover grew abundantly and limestone cropped out everywhere. Yet the alfalfa field was a sorry sight. Thick enough but it stopped growing in May, turned yellow and wouldn't yield a ton of cured hay an acre. But on the lower end of the field it was fine—thick as hair on a dog, rich green in color and nearly two feet high. Why the difference? That was what I was asked to explain. I tested the soil where the alfalfa thrived so abundantly with the Truog soil acidity testing outfit. It showed but a slight acid reaction. Twenty feet away the soil tested very sour, showing a requirement of four tons of ground limestone an acre for the best results with alfalfa. After explaining the result, this question was put to me with very evident doubtfulness: "Do you mean to tell me that this limestone soil needs lime? How can you make that out?" "Yes," I replied, "that is just exactly what I mean to say. This land has been cropped for years. Each crop took out of the soil its share of lime and the rains leached a whole lot more down into the subsoil. This has left the top eight inches sour and without sufficient lime to counteract the acid. For these reasons your alfalfa is now sickly and yellow. But you will find that as the roots get more thoroughly established in the subsoil they will get what lime the plants need and the alfalfa will improve with age.

"Whenever you seed this field to alfalfa again use four tons of ground limestone an acre put on the surface of the plowed land in the spring or fall. That's a prescription which insures healthy alfalfa, increased yields and bigger profits." "But why is the lower corner of this field doing so well? Why is it not like the rest? That's what's always puzzled me." I expected this question, but fortunately it was easily answered by having observed the condition and evidences of washing alongside of the macadam road. "That road has made possible this heavy growth of alfalfa," I replied. "The road!" he exclaimed. "What in the world has that got to do with my alfalfa?" "Simply this," I answered. "This macadam road was surfaced with ground limestone rock. You can see how in many places it has been pretty well worn off by travel and the rains have carried much of that limestone down through these little ditches into this lower corner of your field. That's why the alfalfa is doing so well there. Nature has demonstrated to you better than I can explain, how badly the rest of your alfalfa field is in need of lime."

Liming is neither expensive nor difficult. Suppose it cost $10.00 an acre to apply three tons of ground limestone. At the present time it would only take an increase of one-third of a ton of alfalfa hay to pay the whole bill! And the value of this lime will last and show itself for a period of six or eight years. Not only this—

(Continued on page 12.)

CURRENT EVENTS

THE helmsman on the Norwegian boat which ran into a French munition steamer in Halifax harbor has been arrested on suspicion of being a German spy. The Norwegian boat was in the Belgian relief service at the time of the collision. The helmsman has been in a Halifax hospital for several days, but there were indications that he was merely shamming illness and when he attempted to escape from the hospital he was put under guard. The collision resulted in the loss of over 1,200 lives in Halifax. Early reports had the loss as high as 4,000, but later reports reduced this considerably. Over 8,000 people were injured and the property loss will mount high into the millions of dollars. The suffering at Halifax was beyond words to express. No sooner had the relief work started than a terrific blizzard set in, stalling relief trains and making it impossible for the work of rescue to be carried on. Three different blizzards struck the town in the early hours after the disaster, retarding work of all kinds. A semblance of order is being restored, but Halifax is terribly stricken. The Red Cross and kindred organizations are doing everything possible to alleviate suffering.

FOLLOWING the resolution adopted by congress with only one dissenting vote (the socialist member, London, of the lower house) President Wilson proclaimed war upon Austria-Hungary last week. Similar action will follow against Germany's other allies, Bulgaria and Turkey, whenever the occasion demands. In proclaiming war the president specified that only dangerous Austro-Hungarians in the United States should be interned and that most of the restrictions applied to Germans should not apply to Austrians. Austrians may neither enter nor leave the United States without obtaining special permission, but no restrictions are placed on the movement of Austrian subjects within the country. They will not be registered by police, under the plan adopted for Germans, and will be allowed to live and work in many zones barred to Germans. In explanation of the proclamation Attorney-General Gregory issued this statement: "Many subjects of Austria-Hungary have already demonstrated their strong loyalty to this country by their faithfulness in industrial work, their organization of recruiting committees and in service with our armies. For the present, therefore, no restrictions will be placed upon the movements of subjects of Austria-Hungary. They are not subject to the restrictions of the previous proclamations relating to German alien enemies. They will be permitted to reside and labor in prohibited areas and to travel freely without molestation. Only those who are dangerous or disloyal are subject to arrest."

JERUSALEM, the holy city, was captured from the Turks by the English forces operating under General Allenby. There is great rejoicing over the victory, as the holy places of Christianity have been under the dominion of the Mohammedans for many centuries. Jerusalem has no particular military or strategic importance, but the conquest is hailed as a great event of the war, nevertheless. That it was due not only to the valor of English arms, but also to American asistance is shown by an official report to Washington which declares "In the campaign as a whole the greater accomplishment has been not the defeat of the Turks, but the conquest of the Sinai desert. The troops who fought at Gaza drank water from Egypt pumped through an American pipe line and were supplied over a broad-gauge railroad clear across the 150 miles of the Sinai desert, which has defeated almost everybody that tried to conquer Egypt for centuries. Every ounce of material for the pipe line, the railroad and the other works came either from Great Britain or the United States. All the time this conquest of the desert has been going on the official communications have been able to say only 'nothing to report' and the public thought we were idle. The fall of Jerusalem was made possible by industry, organization and help of material from the United States." American and other military attaches entered Jerusalem with General Allenby.

PRESIDENT WILSON discussed the question of railroad unification with his cabinet last week and reserved decision on the course he will pursue until after a conference with the railway executives. In official circles it is generally expected that Mr. Wilson will deliver a message to congress within a few days recommending a plan of unification of the transportation systems for the period of the war under some sort of government control. There already is considerable speculation concerning the appointment of a federal administrator or a chairman of a body charged with the exercise of government control. Two members of the cabinet are being discussed for this position. One is Secretary of the Interior Lane, a former member of the interstate commerce commission, and an acknowledged railroad authority, who, however, is opposed to any drastic interference by the government with the operation of the railroads at this time. The other is Secretary of the Treasury McAdoo, who is in favor of government control and has been suggested on the theory that the financing of extensions for war traffic will be the big problem involved in any sort of federal direction of transportation.

WITH Germany massing thousands upon thousands of troops, drawn from the Russian front, behind her lines in France preparatory for the most gigantic drive of the world war, Great Britain faces the crisis with grave alarm. While Hindenburg's cannon are hurling great masses of shells in British positions around Cambrai and Ypres, and over French trenches between the Oise and the Aisne, in Champagne, northeast of Verdun, and in upper Alsace, hunting, evidently for a weak spot, England's leaders are in an uproar. Premier Lloyd George is once more under fire. Important changes in the cabinet are expected. The pacifist element gained new impetus when the Northcliffe papers, which have taken a critical attitude toward the government, hinted that former Premier Asquith intends to give unqualified support to the peace policies of Lord Lansdowne. The former premier's decision will have an important bearing on the future action of the government.

PRESIDENT WILSON has signed a proclamation fixing the alcoholic content of beer manufactured after January 1st at 2¾ per cent, a reduction of one-quarter of 1 per cent from the figures set by Food Commissioner Hoover in a recommendation two weeks ago. The text of the proclamation has not been made public, but it was said at the food administration that it will provide for determining the alcoholic content on a weight basis, rather than on volume. This meets an objection of ale manufacturers, who held that the figure set by Mr. Hoover, 3 per cent of the volume of their product, would make the manufacture of ale impossible. The 2¾ weight basis of measurements will give them approximately 4 per cent of alcoholic content, the ale brewers explained. It is provided in the proclamation that the volume of grain to be used in brewing shall be reduced to an amount, approximately 70 per cent of the amount of grain formerly used, enabling the brewing of the same amount of beer.

UNDER the heading "What America Expects of Us," Capt. Andre Tardieu, high commissioner to the United States, gives the French public some homely truths in a Paris newspaper. America, he writes, is willing to give every assistance to France, but in return has the right to ask her to discipline herself. Captain Tardieu says Americans are astonished by the sight of so many pastry shops open in Paris and will not hesitate further to restrict the consumption of wheat. They will limit commerce in other ways, he predicted, and will give France more tankers for gasoline when they no longer meet on French country roads luxurious automobiles conveying the owners on pleasure trips. "America urges the adoption of the principle of a single man in supreme command of the allied fronts," Captain Tardieu continues. "The Americans do not wish to see a repetition of the Somme battle of 1916—one example in a thousand—when, because it had to be a Franco-British offensive, it was made at the junction of the two armies in a swamp. Mistakes in detail may be made, have indeed already been made by the Americans, but their general conception of the war from military and economic standpoints is simpler and, therefore, better than ours and should be listened to."

Increase the Hog Supply.

To the Editor:—By keeping an extra brood sow and raising well the litter of pigs every farmer in the state will be doing a little to help Wisconsin do her share in aiding the nation to win the war.

A fair price for hogs is assured by the food administration. It has said that the price of hogs this winter will not go below $15.50 per hundred for the average hogs bought on the market. The price for next year's crop of pigs will be fixed according to the price of corn in a ratio of 13 to 1—that is, the price of hogs per hundred will be thirteen times the price of corn during the twelve months previous to marketing.

The government can make these promises because of its enormous buying power. Having complete control over the buying of all pork products for all foreign markets as well as for our own army and navy, it can stabilize the hog markets so as to make these prices good.

Our foreign demand is much larger than ever before. Large packers report that they are now putting very little meat in the coolers, as is usual at this time of year. Buying is so brisk that they cannot accumulate a reserve supply. This means a scarcity of pork and may mean more than one meatless day a week next year. The farmer is running no risk in raising a few pigs to sell. The least that he should do is to raise enough for his own meat. He should do the latter for the safety of his own family and he does not speculate if he raises hogs to sell.

A brood sow tucked away in a comfortable corner will not require very much extra labor. A child can feed her. No one need milk fewer cows because they are feeding an extra brood sow or raise less grain or cut less hay. The extra labor is practically negligible.

Pigs have been driven off many farms because of the sale of whole milk. While skim milk is valuable, it is not necessary, so authorities tell us, for pork production. Pigs turned on pasture as soon as they are weaned and fed liberally on middlings, oil meal, tankage, corn and other grain make good gains—so we are told by those who have tried it—and produce very satisfactory pork without any other than their mother's milk.

If pigs can be raised without milk, then in creamery and cheese factory sections the milk and whey available may be pieced out with other feeds like oil meal, middlings, tankage and grain, and made to go much farther than it now does in feeding more hogs.

Though corn and hogs ordinarily go together, pork can be produced without corn as is done in northern Europe, England, Canada and even in some parts of Wisconsin. If we must have fat—and we must have it to live and be healthy—we must learn how to make some pork without corn. This war may last a long time. We have only been in it a few months and already have meatless meals and meatless days. Should it last two years we may have meatless weeks or be forced to do without meat entirely.

No farmer ought to change his system of farming to raise pigs. Farmers, as a rule, will not do this, and it might be disastrous if they did. If he is milking cows—as most Wisconsin farmers are—he should, without doubt, keep on milking cows, and just as many as he would milk if there wasn't a pig on the place.

The only changes in his farming plans that are necessary are those small ones that will make it possible to raise just a few pigs more than he has done in the past.

If each farmer in the state of Wisconsin will raise just five more pigs (a small litter) than he did this year, the state's pork supply will be increased just 50 per cent.

Hog receipts at the eleven principal markets of the country to date are nearly 17 per cent less than a year ago. October receipts at Milwaukee and Cudahy stockyards are but 60 per cent of last year, so that each farmer should raise another litter of pigs if the state's pork supply is to be maintained and our people kept from going hungry for pork. With a fair price assured he can't lose.

If the war continues we'll need the meat. If the war ends, the world still must eat. K. L. Hatch.

FAMILY CIRCLE TALKS
BY THE PUBLISHER

WHEN FARM HEARTS ARE TOUCHED.

ABOUT this time each year I have been in the habit of writing a Christmas article. I have sat down and looked back over the year which was closing, thinking of the many things I had to be thankful for personally; of the wonderful mercies and kindnesses of Him who holdeth us all in the hollow of His hands; of the teachings and example of the Christ child, whose birthday we celebrate. I have written my "Christmas sermon" always with a full heart, but never was my heart so overflowing as this year. I am not going to sermonize or philosophize; I am going to turn the Christmas article over to my readers. There will be two texts. The first is "A little child shall lead them." The second is "He went about doing good."

Something like two or three weeks ago I received a letter from a little girl. She had written to me because I had printed another letter offering to send outgrown clothing to whomever might need it. The little girl wrote to me as follows:

Dear Mr. Pierce: I see you are helping others and maybe you would help me. My papa died December 6, 1916. We lived on a rented farm. After papa died we had to leave the farm. We now live in town. Mama does some washings to help keep us. There are three of us children. I am the oldest one. I am eleven years old. Please tell that lady that I could wear some of her outgrown clothing if she has any more to give away. Please do not print my name in your paper; some might laugh at me.

I expected a few answers, for I knew how tender-hearted were many of my readers, but I was not prepared for the tidal wave of generosity which has fairly swamped us. Before I printed this little girl's letter I had myself sent her a box of clothing, which I thought she might find useful. Since I printed it, scores have written to me asking for her name and address, at least one farm home has been offered to her, two men have sent her money (one $2, the other $5) and any number of packages of clothing have come to me, by parcel post, to be forwarded to her and to other needy and deserving poor. I have read most of these letters with sincere feeling, so tenderly are they written, such a world of sympathy and love do they convey. I shall try to answer all the letters personally, but it may be impossible. Each writer has the satisfaction of knowing that his proffers of aid have been appreciated, that after the needs of the little girl have been fully satisfied, whatever has been sent has been distributed among others who needed it just as badly.

I am going to make my Christmas "sermon" this year out of some of these letters; just a handful picked out, almost haphazardly, from the many. Each paragraph below comes from a different writer; they are characteristic of scores of others. Could I write or preach a better Christmas sermon than is to be found in these words, coming from farm homes all over the grain belt, in response to the plea of the little child whose father **is dead:**

I am a young man and our two children are very small, so we have nothing in the clothing line to give. I had a small bean patch this year and we have more than enough to do us. I am a poor man, but the good Lord has seen fit to deal bountifully with us this year, so we have plenty and some to spare. If you will kindly send me the names of some worthy families I will send four or five families eight or ten pounds of navy beans each. I will send them by parcel post and I will pay the postage.

* * *

Would you please send me the names of some worthy farm families with needy children? I am a school-teacher. My pupils are very much interested in the letters you printed and want to send someone a Christmas box.

* * *

I am an old bachelor and live all by myself. If these folks are worthy I will take them and take care of them, if they will keep house for me. I am a poor man, but I have a heart.

* * *

I am thirty-four years old, make good wages and have no one depending on me for support. I have decided to "cut out" spending money foolishly this winter and help someone who needs it. I find a number of men around here who could help at least one person and not hurt them at all. I will help this little girl by sending her a few dollars to buy books and clothing.

* * *

I am getting old and my life companion lies in the cemetery over on the hillside, but I will do all I can to help someone along life's road. I, too, am poor, but of some things I have to spare and of such as I have will I give. May God's noblest blessings rest on you and yours for the noble work you are doing.

* * *

I am a bachelor and a farmer. I have just disposed of my stock at auction and I expect to be called to the colors in the spring. I have a few things that I think would help some poor folks. I would also send money if I knew who needed it most.

* * *

I have a dear son over in France and I want to do all I can to help others and someone can pass it along to him.

* * *

We are heavily in debt and trying to get out of debt, but I can share something with others. Tell me who to send to.

* * *

I have been a widow for three years; only by the grace of God it might have been myself writing these letters asking for help. If you will send me the address of the little girl whose father died and the mother of the six needy children I will send each one ten yards of new tennis flannel.

* * *

We have three children, two girls and a boy, and we have had misfortune to spare. Our crops were poor for three years. Then our little boy drank muriatic acid and came near dying, but the Lord spared him to us. We certainly have had a time. The little fellow has been under an anesthetic six times. His stomach was taken out and cut open. The acid burned his esophagus and the scar caused it to close up so that he could not swallow anything, but he is getting along good now. We owned our own home when we started farming, five years ago, but we certainly do not own any home now, but we can probably help some unfortunate family, as we have some discarded clothes that are serviceable yet, so if you will send me the name and address of some needy family, with children, I will send them the clothes at once.

It would be attempting to paint the lily or refine pure gold were I to add any comment to these letters, or attempt to write a Christmas article around them. I can only repeat that "a little child shall lead them" and that among my readers there are literally hundreds and thousands who are fulfilling the words of the Scripture: "He went about doing good." May this good they are doing return to them a hundred-fold, in satisfied hearts, in the fulness of comfort and peace and in the knowledge of good work splendidly done!

I purposely left one of my letters to the end. It needs no comment. It carries the whole Christmas message to every one of you. Read it; heed it; nothing truer or finer was ever written:

I have children of my own and know the need of clothing. I will send whatever I can. The poem you printed was good, but I recall one which I think still better. Here it is:

"Go! give to the poor the charity's bread,
For giving is living," the angel said.
"But must I be giving again and again?"
My weary and wandering answer ran.
"Ah, no," said the angel, piercing me through,
"Just give until the Saviour stops giving—to you."

The Proper Christmas Spirit

The Poor We Always Have With Us; and Remember That "Inasmuch as Ye Have Done It Unto One of the Least of These My Brethren, Ye Have Done It Unto Me."

LET THE NATION OWN THE RAILROADS.

WE HAVE the war to thank for a broadening of ideas, a widening of vision, which it would have taken decades to bring about in peace times. Reforms which marched with lagging steps four years ago are now rushing forward at lightning speed. We are making economic and industrial history, as well as military. The things which we carried in our own minds, unspoken for the most part because it seemed impossible to realize them, are now topics of daily conversation, are now rapidly becoming assured facts.

I believe that by the time the war ends we shall have brought about many changes and reforms in this country which will work for the betterment of all men. It is inevitable that woman suffrage will result from the war; already New York has put its seal of approval on the question, the first state east of the Mississippi to give unqualified commendation to equal rights for both sexes. National prohibition is also likely to result. It is quite probable that congress will take the necessary constitutional steps this very winter. These are things which would have come slowly—if at all—in peace times. But the war has robbed issues of much of their sectionalism, much of the bugaboo of politics; it has presented them to us in the nakedness of truth and we have clothed them with the mantle of legislation and popular approval.

I am convinced in my own mind that the time has come when a great industrial change is needed, when it must be brought about if we are not only to win this war, but to keep our position in the forefront of all the nations of the earth. The change to which I refer is the abolition of private ownership of railroads and the adoption of government ownership. Already there are signs that this is coming in the very near future and that the minds of men (even those who opposed it a few years ago) are open to the fact. We have made rapid progress in this direction in the last three years; I might well say the last year. Already the United States government is preparing to take over the great railroad lines and operate them as one system, for the duration of the war. The president will probably go before congress in a few days and advocate this. Thirty-eight railroads, east of the Mississippi river, are to be operated as one, their rolling stock mobilized, their entire management entrusted to a government supervisor, probably a member of the president's cabinet. It will be but a step from this to the government's taking over the railroads and running them even when peace returns to our fair land.

After all, why should this not be done? What argument, other than the shock of a great change, is there to advance against it? Railroads are public servants; they should be operated with an eye single to the public good. Yet in the past, all too often, they have been operated and manipulated to the advantage of unscrupulous financiers and speculators. Roads have been deliberately wrecked in order that men might make vast fortunes. Grain has been left to rot in the fields, stock has been

THE WISCONSIN FARMER, Madison, Wisconsin

Wisconsin Automobile Record.

The state of Wisconsin smashed all its previous automobile records with 164,530 registrations of new and old cars in 1917. This is an increase of over 48,000 above the 1916 registrations, and a gain of more than 41 per cent in the state. The figures are interesting as reflecting the prosperity of this great state, but a careful study of the statistics shows a few things which are rather surprising.

In the first place Upper Wisconsin is gaining in number of automobiles figuring on a percentage basis much more rapidly than other portions of the state, and the counties which are developing farms are making the largest per cent gains. While Fond du Lac and Walworth counties, in southern Wisconsin, gained only about 33 per cent over the previous year's registrations, Ashland county gained 75 per cent. Other counties in Upper Wisconsin gained as follows: Barron, 65 per cent; Bayfield, 79 per cent; Burnett, 75 per cent; Chippewa, 60 per cent; Clark, 54 per cent; Iron, 94 per cent; Langlade, 60 per cent; Marinette, 55 per cent; Oconto, 58 per cent; Oneida, 71 per cent; Price 99 per cent; Rusk, 58 per cent; Sawyer, 57 per cent; Shawano, 54 per cent; Vilas, 60 per cent; Washburn, 84 per cent. As the general average of increase in the state is about 41 per cent it will be seen that Upper Wisconsin has outdistanced all other portions of the state in percentage of gains.

Another fact of interest is that the rural counties have gained a larger percentage, in almost every instance, than the counties in which a large city is situated. Milwaukee county has gained 35 per cent over the registrations for 1916, which is 6 per cent below the general state average. The same condition prevails in La Crosse and Kenosha counties, but Racine county is an exception and has gained 46 per cent.

But Jefferson county, with no large city, and with the business of farming and dairying occupying the attention of most of the people and earning most of the profits, gained 49 per cent, Juneau 48 per cent, Adams 48 per cent, La Fayette 46 per cent, Waukesha 44 per cent, Waupaca 49 per cent, Polk 49 per cent, Wood 47 per cent, St. Croix 43 per cent, Pierce 55 per cent, Trempealeau 50 per cent, Columbia 55 per cent, Sauk 43 per cent, Pepin 52 per cent, Ozaukee 50 per cent, Dodge 51 per cent, Buffalo 46 per cent, Washington 44 per cent, Portage 48 per cent and Marquette 49 per cent. All these are considerably above the general average increase of 41 per cent in the state, and all these counties are chiefly dependent upon farming and agriculture. These percentages are ample proof that the bulk of cars are being sold in the agricultural communities of the state. This is true because the automobile has come to be a utility rather than a luxury on the average farm in Wisconsin. Farmers have been able to use their cars for so many purposes, and have so adjusted their farm work to this rapid means of transportation that they feel they cannot get along without a car. In fact they regard the car almost as important as any machine on the farm.

A year ago we had an automobile in Wisconsin for every twenty-one people. Now we have a car for every fourteen people. In another year the number of cars, provided anything like normal conditions prevail, will pass the 200,000 mark and probably run to 225,000. At 225,000 we will have a car for every ten people in the state. In other words, there will be enough cars to carry all the people of Wisconsin at once with only about four hanging to the running board. There will be enough cars, if they were all lined up at once, to transport nearly a million soldiers, and if for any reason the train service of the country should be paralyzed a very large part of the business of the state could be carried on in automobiles—provided we could get gasoline. A business which in the lifetime of most of the farmers of the state had not been heard of, has developed into one of the most important enterprises in the state. And it is destined to grow still more. There are over 177,000 farms in the state, and when we get to the point where we look upon a car as of just as much importance as a team we will have no less than 177,000 cars on the farms of the state. Many farmers now have two or more cars. It has been remarked that automobiles and silos run along together in the agricultural statistics of the state. Farmers have about 65,000 to 70,000 silos and at least that many automobiles. In the last two or three years the automobile if anything has been getting the jump on the silo. There is no particular relation between the two except that we have found that the man who has a good big silo, and perhaps a couple of them, somehow makes good profits on his farm and soon has an automobile.

Hog Profits.

It was not so many years ago that we used to keep the brood sows confined in small, bare, dirty pens with nothing to eat except corn, some house slop and water when it was thought of and then we wondered why the sow's litters were not large and healthy. A pasture where they could exercise freely was unknown to those sows.

"Pigs were pigs" then, but today pigs are being called upon to feed the world. If such practices as just mentioned were generally followed now there would not be enough meat to even feed a small part of our own country, to say nothing of the world. Even with our increased respect for the hog and the vastly improved methods of feeding, care and management, there is altogether too much neglect for the benefit of all concerned.

It must be remembered that the brood sow must have protein and mineral matter as well as carbohydrates and fat if good, strong-boned, healthy pigs are expected. It is the deficiency of this protein in the form of tankage, meat meal, oil meal, alfalfa and clover, rape, etc., and mineral matter in the form of charcoal, salt, sulphur and ordinary lime that prevents the hog from making rapid and economical gains.

The best feeders, and by "best" we mean those who get the greatest net returns, keep their hogs well supplied with one or more of the above-mentioned feeds at all times. The prices of protein feeds are usually high, but even so they have been found to be cheap and economical for hog feeding. Because a great many feeders do not know the real value of these feeds and because of their apparently high market price, they refrain from using them. This is no time for wasteful feeding practice and if a man does not feed economically he cannot expect reasonable profits.

This lack of protein and mineral matter in the ration is the big reason for sows becoming vicious and eating their pigs. The sow has a depraved appetite. It is commonly recommended to give such sows salt pork. What does this mean? Simply that the salt pork supplies that protein (lean meat) and salt that she is starving for.

We have seen sows heavy with pig eat charcoal until their droppings were black. We have seen vicious sows become excellent mothers when brought under correct management. It must be evident to those who are having trouble in their herds that something is wrong.

It is not customary to see alfalfa or clover hay standing in racks in the hog lot during the months when there is no pasture, but the time is coming and coming fast when such practices will be followed by a large majority of hog growers. Right now is the time to plan a change in the feeding practice. Clean up the pens and arrange for free exercise and there will be less trouble all around and greater returns.

Hog raising, like all the rest of the live stock industry, has a bright future and it is up to the owners to make the best of their opportunities.

Know Your Herd.

It was not so long ago that we were driving along a country road when we were attracted by a neat-appearing farmstead with a herd of about twenty-five uniform-looking cattle grazing in a near-by pasture.

This man, we reasoned, was evidently a progressive breeder in his community. Upon stopping and making the owner's acquaintance we were very much disappointed to find that he knew nothing about the breeding of this excellent lot of individuals. Here was probably a well-bred herd with their registration papers and extended pedigrees, if any, stowed away somewhere in the house in anything but an orderly and systematic way. If a duplicate of those "papers" had been stowed away in this man's head he would probably have been much better off in a financial way.

Isn't it a waste of money to spend years in building up a satisfactory herd of pure-bred animals without ever making any extended effort to learn their breeding? Modern buyers demand to know why when they are asked $200 and more for a single animal and they look to the owner to tell them in a convincing way why they should pay that much. Unless a man knows thoroughly the pedigrees of his animals, he cannot expect to get prices that the animals are really worth and consequently he is losing money.

Take notice of the man who is getting good, substantial prices for his stock and you will find that he knows how much that stock is worth and how much he can get for it. If a man has the ability to build up such a herd as this man has he certainly is capable of learning their breeding.

We acknowledge that learning pedigrees is not the easiest thing in the world, but surely a man cannot afford not to be familiar with the breeding of his own herd.

Room for More Poultry.

Mr. A. D. Wilson, federal food administrator for Minnesota, makes the statement that out of a total of 6,371,502 farms in the United States, 1,527,743 report no egg production in the last census. Here is a wonderful opportunity to increase the meat supply and to increase the number of eggs produced. It scarcely seems possible that there are so many farms in this country where the subject of poultry has been entirely overlooked. It is hard to imagine that any farm in the grain belt section will fail to produce enough poultry and eggs for home consumption. There must be some parts of the country which think much less of poultry than do the farmers of Wisconsin. We would almost as soon think of a farm without a plow or without a team of horses as to think of the farm with no hen coop, no spring frys and no fresh eggs.

The poultry columns of The Wisconsin Farmer offer valuable suggestions to those who wish to increase the production of poultry products on the farm. As we have before stated, it seems almost unreasonable that any considerable number of our readers are not supplied with some chickens. But if there happens to be any, we strongly urge that this condition be corrected just as soon as possible. Dressed poultry and eggs are forms of food which are not shipped to the world's fighting area in any considerable volume. The government has never suggested cutting poultry off the bill of fare and no one has ever suggested an eggless day. These foods are just as valuable in sustaining human life as beef or pork, and because they are such there is no likelihood of losses to poultry raisers or egg producers as long as the present meat shortage exists. There are men who tell us that the shortage of beef and pork will not have been changed into any considerable surplus before men, now in the prime of life, have become whiteheaded. Just how many years it will be before the world is back to the normal production of pork and before the slaughtered beef animals can have been replaced and the relation of beef production to consumption brought back to where it was ten years ago, we are unable to say. But it will not be next year, nor the year after nor in the four or five years following.

Poultry can be raised on the farm without large investments. It can be started in a small way. The growth of the flock, if properly handled, is rapid and the returns either in money if the stock of eggs are sold or in food for the farm family, will be abundant. On the 177,000 farms of Wisconsin there should be 177,000 hen coops and 177,000 flocks. If you are a slacker in this respect, wake up.

The Farm Paper a Splendid Investment.

Mr. J. L. Krause, a subscriber of Dodge county, Wis., writes to The Wisconsin Farmer as follows:

I realize that a timely suggestion or advice can often be of very great value to a reader as, for instance, to myself. In the summer of 1911 I read an interesting article on handling clover seed. The article impressed me so that I followed its suggestions closely, applying the information which I had gained to a field of six acres of medium red clover which produced over five bushels of fine clover seed to the acre. Others in my neighborhood pastured their second crop of clover, saying that it would not pay for the trouble of cutting and hulling, and they tried to talk me out of saving the seed. The seed looked so good to me that I exhibited a peck lot, winning first premium, and from that time until now I have not only done my level best to grow good grain, and get good seed, but to continually improve, and I feel that the end of this work is by no means in sight so far as I am concerned.

Mr. Krause has said in a previous letter to The Wisconsin Farmer that the article to which he refers was published in this paper. Since it was first put into Mr. Krause's head to farm a little better than he had ever done before and excel in special lines, he has had a notable series of successes in capturing awards at the grain shows and fairs. That his exhibits will show up strong at the annual Experiment Association Show at Madison this year is certain, as he has already secured notable recognition at the Wisconsin State Fair and at a number of county fairs. At the state fair Mr. Krause was awarded first on Kherson oats, second on peck of No. 5 oats, second on bundle lots, and second on any other variety. At the big Dodge County Fair Mr. Krause was awarded first on Kherson oats, first on No. 1 and first on No. 5 bundles, and second on peck lot, and also first on any other variety of oats. At the Watertown fair Mr. Krause was awarded a premium on each of the six exhibits he had on display. At the Wisconsin State Fair Mr. Krause took seventeen premiums on twenty-one exhibits of peck lots of grain and sheaf exhibits of grain and grasses.

These facts are stated to show that, in farming, big things may result from a suggestion which may not occupy a great deal of space in the farm paper. At this time The Wisconsin Farmer is making a special offer of three years for $1.50, just half the regular price, and this in spite of the tremendous advances in cost of paper and other items entering into the publishing business. As we write this we have no means of guessing what the price of The Wisconsin Farmer may be before another three years have rolled by. Whether we can make the "three years for $1.50" offer next year we cannot say. Most publishers have already raised subscription rates and some have doubled them. To save money, and be assured of regular delivery of The Wisconsin Farmer for three years, send $1.50 now. It is absolutely certain the price will not be any lower. And as to how much higher it may go we cannot now predict.

Readers of The Wisconsin Farmer

will be interested to know that the paper has 90,000 circulation, much more than that of any other Wisconsin farm weekly, and 78,000 (approximately) of that number are our own Wisconsin folks. An old established paper with such a solid foundation as The Wisconsin Farmer has in the way of paid circulation, will be sure to be always a good paper. The support which the paper receives from the farmers of the state warrants improvement every year, and this is the policy which will be carried out. Send in your subscription now and suggest to your neighbor to do the same. The big subscription rush comes in a few weeks, and the publisher will greatly appreciate it if as many as possible will remit right soon. You have no idea how much prompt remittance helps in handling the accounts in the office.

Wisconsin Farm Power Month.

So much importance is attached at this time to the need of applying something more than horse power in order to secure a maximum of food production that the college of agriculture has inaugurated farm power month and a special course of instructions will be given at the college beginning January 22d and ending February 16th. While the college of agriculture is quite well equipped with trained men to give instruction in agricultural engineering and the application of power to the farm, it has been decided to call in help from outside and trained representatives from shops of several leading farm machinery manufacturing concerns have been invited to participate in the class work. It will not be possible to handle a large number of men at this school and, in fact, it has been decided to limit the number to fifty. These men will have first-hand instruction in the mechanism and operation of gas engines, trucks and tractors. When they have finished this one month's course they will know how these machines are made and why and will have some very good ideas on how the machines can be economically operated.

Mr. F. M. White, of the agricultural engineering department, will direct the course, assisted by the members of the regular staff and the following representatives of manufacturing concerns:

J. W. Dickerson, Hart-Parr Co., Charles City, Iowa; H. L. Thompson, Moline Plow Company, Moline, Ill.; Col. T. A. Peck, Vacuum Oil Co., New York; Fred Glover, vice president, Emerson-Brantingham Co., Rockford, Ill.; L. R. Van Valkenberg, service department, Avery Company; G. B. Gundlogsan, J. I. Case Threshing Machine Company, Racine; E. I. Wood, J. I. Case Plow Co., Racine.

Several ignition and carburetor companies will add strength to the course by sending representatives to address the students. The International Harvester Company has also promised assistance. Advance registration is required for those who take the course.

Uses of Salt on Soft Corn.

Our attention has been called to the practice of using salt on soft corn at cribbing time. The commission firm of James E. Bennett & Co., Chicago, is reported to have employed a specialist to investigate this matter in Whiteside county, Illinois, and here is his report:

Accompanied by an experienced grain dealer I investigated thoroughly the use of salt for preservation of soft corn in the vicinity of Prophetstown (Whiteside county), Illinois. We found numerous places where corn was being salted or had been salted. We interviewed many experienced farmers on the subject and acquired the following interesting information. T. J. Marshall, a large successful farmer, residing about one and a half miles south of Prophetstown, gives us the following data: In 1881, the year in which so many farmers experimented with large yellow seed corn from Kansas, it was found that this corn did not mature. Mr. Marshall informs us that while cribbing corn that year, an elderly German, John Liphart, advised him to salt his soft corn. Liphart stated that this method of preservation had been adopted in Germany and Sweden, the climate not being adapted to maturing corn. Marshall adopted the German's suggestion, operating under his directions to use from two to two and one-half barrels of salt for each 1,000 bushels of corn, that is equivalent of about ten quarts of salt to each ordinary wagonload of ear corn, salt being sprinkled over the corn as it was being placed in the crib. Mr. Marshall states the experiment was a pronounced success. Corn which he cribbed early without salt that year was lost. The crib that was salted came out as dry as a bone, just as bright as it went in and absolutely free from mold and rot though light in weight due to the moisture drawn from the corn by the action of the salt. The process was used from time to time but was again extensively used with the soft corn crop two years ago (1915). Mr. Marshall induced his neighbors to salt their soft corn and informs us the result was highly satisfactory, resulting in many converts. This year these same farmers and many recruits to the method are applying the salt. Practically the entire stock of the common barrel salt in this vicinity was exhausted. E. J. Mathis, of the Mathis Bros. Co., grain dealers at Prophetstown and other points, said his firm has sold several carloads of salt for this corn crop. Local farmers seem to have accepted the salting process and adopted it into their regular method of farming, claiming it has been thoroughly tested on previous occasions and found effective and highly satisfactory. In addition to interviewing farmers who were using the method, we were particularly interested in our visit with Albert Bessire, a big farmer. He showed us one crib of 1,000 bushels of new corn which had been treated with salt. Mr. Bessire removed one of the crib slats and we took out sufficient corn to penetrate an arm's length. We found the corn very cool, in fact cooler than the outside temperature, perfectly sweet, but, of course, wet. This corn had been in crib several days. It is further stated that corn cribbed with salt passes through the winter in its soft or green state, drying only with the coming of spring winds and rising temperatures. It is claimed this soft corn absolutely does not heat. We have looked into the matter carefully and are convinced the process has sufficient merit to justify a thorough investigation, not only by the individual, but by the agricultural departments. Salt retails in Prophetstown at about $2.45 per barrel of 280 pounds. It is stated that the corn comes out in the spring practically free from any taste of salt.

As there is yet a great deal of soft corn to crib it would seem as if the plan of using the amount of salt here suggested may be advantageously carried out. It is a well-known fact that salt tends to prevent newly stored hay from heating and in a measure the same conditions are present in a crib of soft corn. In all probability there will be some heat generated in any event unless the weather is exceedingly cold, and this will possibly break salt down into its component elements, namely, sodium and chlorine, one or both of which unquestionably have a preserving effect on the corn.

The "Off Year" in Apple Production.

Before the session of the Wisconsin State Horticultural Society in Madison last week Mr. R. H. Roberts, of the Wisconsin Experiment Station, discussed the "off year" in the apple business. Some study has been given this apparent habit of some popular varieties in Wisconsin, particularly the Wealthy, to produce well only once in two years. Mr. Roberts says that the general belief that the "off year" is due to exhaustion caused by fruiting is not necessarily correct and that experiments conducted in fruit thinning show that excessive bearing may be prevented by the mere production of blossoms without regard to maturity of the fruit. We quote from Mr. Roberts' paper as follows:

The trees with the large per cent of non-blossoming spurs will normally produce blossoms and fruit again next year. As these were found to have actually borne the greater amount of fruit. It is apparent that fruit production is not necessarily the cause of the off year.

Thinning the fruit has been advanced as a remedy for biennial fruiting. As it has been repeatedly reported as having failed to produce annual bearing, studies were conducted to determine why thinning was not successful in practice. It was found that only where the blossoms or young fruits were removed previous to the time when they would normally be said to have set, was there production of blossoms on the spurs where removals were made in the year following the removals. If the fruits were removed after they had set, no blossom buds were formed on these spurs. As commercial thinning is done after the fruits have attained considerable size and is consequently too late to affect the blossom bud formation of the same season, it is seen why this thinning has failed in practice as a remedy for the off year.

The size of the leaves has a large influence upon the growth of the spurs arising from one-year wood, as it was found that the largest spurs came from the bud where the largest leaf had been the year previous. It was also found that these larger spurs continued to grow and function more vigorously through the successive seasons than the smaller spurs. It is, then, especially important to protect the foliage from injury by insects, diseases, or even spray materials if the trees are to be retained at a maximum fruiting efficiency.

If any one factor of the several studied is to be pointed out as being more particularly responsible for the off year, it would seem from the present studies, to be the production of an excess number of blossom buds. Trees that are very heavily laden with blossoms will not necessarily bear the most fruit, as the set of fruit was found to be inversely proportional to the number of blossom buds present; that is, more fruits were produced on the trees with about one-half fruiting and one-half non-fruiting spurs, than where all the spurs were blossom spurs. From the standpoint of blossom bud formation, this is largely a determining factor, as the spurs which produce blossoms even when they do not set fruits seldom produce a blossom bud the same season. The blossom buds on non-fruiting spurs were found to have begun to form about three or four weeks after the fruit had set, so in cases where the spurs produced blossoms, it seems to have a depleting effect upon the spur which prevents it from producing the blossom bud the same season it produces blossoms.

It may be concluded as a result of the work done thus far that annual bearing is not a plant habit, but is rather the result of a condition within the tree. The fact that an annual production of blossoms can be produced by blossom removal is generally considered to be due to an exhaustion of the plant foods to such a point that blossom bud formation is not possible in the same year in which blossoms and fruit are produced.

It also appears that annual bearing cannot be expected to come from the fruiting of individual spurs in successive seasons. In order to have fruit produced annually, it would seem to be necessary to have two series of spurs on the tree which would alternate with each other in production of blossoms and fruit. It is apparent from a study of non-fruiting spurs that they are the result of two conditions: one is the condition of very weak growth, while the other is the opposite condition, of very vigorous growth; that is, the spurs which produce blossoms are medium sized spurs measuring in length from one-eighth to one-half inch in length. If the spurs are shorter than this, they usually fail to produce blossom buds, while if they are much longer, as two to three inches, they also can be expected to form a terminal leaf bud. This latter condition suggests the line of work to be followed in working out the probable solution for the off year.

Experiments have shown that cultivation, soil, fertility and pruning have had a marked corrective effect upon biennial fruiting.

The studies suggest that this was the direct result of the extra vigorous growth which the well-tended trees produced. These experiments would indicate that we may evpect from further study of the fruiting habit of the apple to be able to work out general suggestions in the matter of pruning and general culture operations that may materially decrease, if not largely eliminate, the condition of biennial bearing which is at present of such economic importance to apple growers.

The studies of the experiments conducted by Mr. Roberts and his associates will certainly be of very great value to the state of Wisconsin if they shall result in a large annual crop and to any considerable extent do away with the discouraging "off year."

Establishing the Farmer's Case.

For some months the consumer has been obliged to pay what he considers a pretty high price for potatoes. Without thinking, the consumer has quite frequently imagined that every farmer who raised a few potatoes was becoming immensely rich. One of our good state journals, the La Crosse Tribune and Leader Press, recently addressed a communication to the Wisconsin Experiment Station asking for some information as to what it cost to produce potatoes. Mr. H. C. Taylor, of the college of agriculture, was put to work on the job and he has prepared an answer dealing with a few fundamental considerations upon the relationship between the cost of producing potatoes and the price which farmers are asking for the crop. Mr. Taylor estimates that the average cost in the Wisconsin potato district for producing potatoes prior to the beginning of the war was $32.47 per acre and he distributed this cost in about the following order:

Labor of man and team	$16.87
Seed	3.39
Spray material	.44
Containers	.44
Taxes	.60
Insurance	.10
Machinery depreciation	2.00
Interest on land at 6 per cent	4.03
Overhead	.84
Manure	3.76
	$32.47

Applying this for the normal yield Mr. Taylor gives the average cost at the farm of 25.6 cents per bushel. To this should be added a hauling charge. But for the year 1917 the cost of production was much higher, Mr. Taylor estimating that this cost increased from $32.47 per acre to $69.50 per acre and distributes this higher cost as follows:

Labor of man and team	$20.00
Twelve bushels of seed at $3	36.00
Spray materials, containers, etc.	1.20
Taxes	.70
Insurance	.10
Machinery depreciation	2.50
Interest on investment in land	4.00
Overhead	1.00
Manure	4.00
	$69.50

This brings the cost per bushel at the farm for the 1917 crop up to 55 cents, being a little more than double what it was before the war. In the ante-war period farmers were prosperous and happy selling potatoes which cost thm 25 cents per bushel at 50 cents per bushel. Mr. Taylor observes that carrying out this same ratio between cost and price the present market price would be $1.10 per bushel at the farm. We quote further from Mr. Taylor's reply to the general inquiry from consumers:

At first this wide difference between cost and selling price (which seems to be essential to prosperity) may seem entirely too large, but the fallacy is in using average cost as the basis of price. As a matter of fact, in the detailed figures secured for the central Wisconsin district, the farm cost of producing potatoes varied from 19.9 cents to 36 cents. On the basis of the available figures the cost on individual farms would range, in 1917, from 40 to 80 cents per bushel at the farm.

If potato production is to continue, the farmer who produces at the higher cost must be kept in the business as well as those who, because of higher efficiency and more favorable circumstances, are able to produce at the lower cost. If prices equaled average cost, the half of the farmers who are producing at a greater cost than the average would be crowded out of the business, and the public would suffer because of a shortage of supply. It is a generally accepted principle in economics that the long-time-average price or normal price of farm products should be sufficient to pay the cost of production under the most unfavorable circumstances, or the highest costs essential to the delivery of the supply needed. On this basis the normal farm price at the present time might be estimated at 80 cents, but to this must be added the cost of storage on the farm (until such time as they are to be marketed), and the cost of marketing. The average haul in the potato district is four miles. The getting of a load of potatoes out of the cellar, hauling them four miles, unloading them, and getting back home is all one man and team will do between chore time in the morning and chore time in the evening this time of year; hence a charge of 10 cents a bushel does not seem abnormal for delivery. On this basis we would have the greatest cost of 90 cents a bushel as the lowest price at which the potatoes could be delivered and yet enable the farmer to stay in the business. If the farmer is to have any profit above costs it would need to be added to this 90 cents. In the long run this farmer will, perhaps, not receive a profit. It is the farmers who are producing at the lower cost that make the profits. But the present time is abnormal in that, due to scarcity of labor, nearly everyone who works is securing a higher return than usual, and the farmer should have his fair share of the surplus profits available due to abnormal conditions.

Farmers, as a class, are impressed with the seriousness of the present situation and will be found willing and ready to do their part in fighting the nation's and world's war for democracy. Of course it is impossible that in doing so they may maintain now and in the future their economic independence of other classes. They, no doubt, will be willing to produce not only at a small profit, but even without profit or at a loss when it becomes a national rule to do so.

So it appears that the farmer is not such a robber after all. Mr. Taylor's figures are quite illuminating. It must be taken into consideration that everyone is pushing the farmer to the limit for added production. This means greater investment on the part of the farmer and in all fairness greater investment of money, time, labor and land must be expected to bring greater returns. Last spring when the farmers were most insistently urged to increase the acreage of potatoes the price of seed was the highest in history. The price of good seed is going to be high text spring, though perhaps more reasonable than in 1917. In the case of wheat the government found it necessary to guarantee a high price to stimulate production, but on potatoes the farmers of Wisconsin took their own chances and they delivered the goods with a tremendous crop.

BADGER FARMER'S MAIL BAG

FARM EXPERIENCES

A Believer in Fertilizer.

To the Ediotr:—Many Wisconsin potato farmers are right in the forefront today when it comes to modern methods of potato culture. Potato growers from other states come here to learn of our growers. Perhaps Wisconsin's growers can learn something from other states.

One of the best small farms in Onondago county, New York, is owned by Mr. Peter Shaver, at Clay, New York. Mr. Shaver has only fifty-four acres of land, yet he takes about as much prduce off it in a year and makes as much net profit as the average farmer who has two or three times as many acres. He grows quite a variety of crops and makes each of them pay a maximum profit.

No cows are kept on the place in the summer, except one for home production. Mr. Shaver feeds about fifteen head each winter to use up the coarse fodder on the farm and furnish some manure. He says he cannot afford to keep cows in the summer, as they interfere with his other work and do not return as much for his labor as do his crops. The manure produced is quite a help in keeping up the humus of his soil and plenty of high-grade commercial fertilizer does the rest.

Mr. Shaver uses commercial fertilizer liberally on each of his crops. He applies 500 pounds on potatoes where manure is used and 1,000 pounds where no manure is used. For corn he spreads 500 pounds broadcast besides a light coating of manure. Other crops such as oats, beans, etc., have applications in proportion. Mr. Shaver says that a number of his neighbors who have farms similar to his use little or no fertilizer, but haul manure from the city ten miles away. Mr. Shaver does not believe in this plan at all. He thinks the cost of the manure is entirely out of proportion to its value when it is hauled any great distance. Besides this, Mr. Shaver says he gets better results with fertilizer and the amount of manure he has than his neighbors who spend as much for manure as he does for manure and fertilizer.

Mr. Shaver always has a good crop yield. His corn usually yields seventy-five to eighty bushels of shelled corn. He has often obtained seventy-five bushels of oats. His clover is always good and he never has trouble getting a good stand. This year he cut fifteen large two-horse loads on five acres.

Mr. Shaver had a splendid field of potatoes this year. Considering its size—nine acres—it was probably as good as any field in New York state. It certainly was the best the writer has seen. The stand was perfect, the fields clean, and the vines showed a wonderful growth. The only regret Mr. Shaver has is that he did not use more fertilizer. "If I had it to do over again, I would use a ton instead of 1,000 pounds," he said. He went on to explain that he had to do just as much work when he put on the smaller amount and h was sure the heavier application would pay him good returns on the investment. This is the attitude a great many progressive farmers are now taking—that more fertilizer reduces the labor per bushel by increasing the yield without materially increasing the labor.

E. G. McCloskey.

Small Value for Whey.

To the Editor:—I am going to give you my opinion about hauling milk to the condensery. With the present high price of feed I think it would be better to haul to the condensery. The whey is being separated at most of the cheese factories, so I don't value good, clean whey any more at much more than 10 cents per hundredweight and I will say that good whey we very seldom get. The average test in our vicinity is about 3.5 to 4 per cent. I have tried to give some study to balancing my ration for the winter and have decided to balance the same with silage, clover hay, mixed clover or timothy hay and alfalfa, using grain feed, Unicorn feed and oats. I have plenty of silage and, while corn was not sufficiently matured this fall, I am hoping that it may be all right for feed. I have not opened my silo as yet. I am a member of the Wolf River Cow-Testing Association and will say that our members are all buying feed in abundance even at the high prices. Quite a few other farmers, who are not members of the association, are rather undecided about buying, as they have no record to show whether it pays or not. Adam G. Brey.

Kewaunee Co., Wisconsin.

Does Not Favor Grading.

To the Editor:—For some time I have been an interested reader of your fine farm paper, and I was recently reading your article about the potato show at Madison. Now I am one of these men who does not believe in grading potatoes at the present high cost of living prices. In this country there are thousands of bushels of potatoes in cellars awaiting a better market and those poor men who are forced to sell to make their interest are selling No. 1 potatoes for $1.10 per hundredweight, No. 2's at 70 cents and No. 3's at 25 cents, but of course the No. 3's are not sold. They are brought back and fed to stock or saved for seed. Unfortunately, these poor farmers will sell all that is salable and will plant the culls, and what do they expect to get in another year? I am a man of poor health, 28 years old, and I have 120 acres half paid for, and I have been doing all in my power to produce more food, but it hurts me to see those nice, small potatoes fed to stock when the rich man could help eat some of them as well as the poor. This grading has not hurt me very much, for my potatoes are fair, and I have sold most of them for an average of $1.15 per bushel, but some of my neighbors have from 1,000 to 2,500 bushels in the cellar, and they are picking these nice, small potatoes and feeding them to their hogs. If the price would range somewhere within the grades of grain prices, I think they would stop feeding them. I am a poor man, but when they had the Red Cross drive I borrowed money from the bank to give for that purpose. I am very much afraid there won't be as many potatoes planted another year, for this ground around here is not the best of soil, and people will be afraid to plant so many of the small potatoes, but this is not going to faze me, for I am going to try and do my bit, if my health will permit. We use one-third less wheat and meat than we did and I think we are fully as well off as before. I wish that readers of this good paper and all others could stop and think not to waste and not to feed stock what we can eat ourselves, especially when there is plenty of other food for the stock. I know there is a large crop of potatoes, and people should eat more potatoes. I am in hopes the war will soon be over and that it will end in favor of the United States and that our farm boys can come back and help get a bumper crop for another year. With best wishes for success to you and all the readers of your good paper,

Portage Co., Wis. J. J. L.

Sample of Wisconsin No. 25 Corn, Raised by C. A. Correll, Marinette County.

Value of Whey.

To the Editor:—There is some talk that the condensery at Algoma is to make a regular practice of gathering milk in the southern part of Kewaunee county, but we have had nothing definite announced as yet. It is my opinion that it will pay farmers to sell to the condensery if the price per hundredweight is 60 to 75 cents higher than at the cheese factories. I am at present feeding oil meal and oats and other farmers in this community are buying bran and oil meal to use with home-grown grains. It seems to be necessary to feed high-protein feeds and we all have to come to it. Silage is a short crop and quite a few farmers in this neighborhood did not get their silos filled and the quality is off about twenty points, the corn being very green and most of it badly frozen.

Kewaunee Co., Wis. W. C. Katel.

[With the present feeding problems, especially connected with the effort to increase hog fat in this country, the value of the whey returned by the cheese factory or the skimmilk left over after using the separator must be taken seriously into consideration. As the condensery leaves the farmer no by-product, it is right that they should pay more for the whole milk. As to what value should be placed on whey or on skimmilk that is a matter effected by each individual case depending upon what stock there is on the farm to utilize this feed. Mr. Katel places a rather high value on whey and it is well to consider its value of some importance rather than to underrate it —Editor.]

A Lesson Learned at Considerable Expense.

To the Editor:—I am glad of the opportunity to send you a few lines giving my experience the past season with Wisconsin No. 25 corn, which I am making a specialty of growing. Will say that this has been an unusual season for corn not only in this northern country, but all through the corn belt there is probably the largest crop of soft corn ever grown. Notwithstanding the cold backward season the Wisconsin No. 25 ripened for me. Help being scarce at the time I concluded that I would cut it in order that I might have more time to husk it out of the shock. I had just begun to husk and place in the drying shed when the unexpected freeze of October came on. Thinking that probably the inside of the shocks might be fit for seed, I saved about a hundred bushels, discarding all ears on the outside of the shock. I have made a number of tests with the following result: Taking five kernels from each ear I found that 50 per cent of the ears all germinated good and strong, 40 per cent of the ears germinated 75 per cent and 10 per cent of the ears didn't germinate at all. Judging from this I could by testing every ear get fifty bushels of good seed; this, of course, is a big job and I am not prepared for it. The lesson that I have learned this season (and it has cost me about a thousand dollars) is to take no chances in the future. I could have saved 300 bushels of good seed had I commenced a week earlier.

C. A. Correll.

Marinette Co., Wisconsin.

Potatoes in Rusk County.

To the Editor:—I will give the readers of the Mail Bag some of my experience in potato growing the past season. I used Green Mountain seed which was as nearly pure as one can get. This seed was treated with a solution of formaldehyde for scab. The seed was planted in rows three feet apart and about sixteen to eighteen inches apart in the row. As I now remember it, I planted early in June, but another year I mean to plant not later than May 15th, for this season the vines were exceptionally well set, but the crop averaged small because of early frost. For cultivation we plowed deep at the first and after that merely kept free from weeds by shallow plowing. To get rid of bugs we hand sprayed, not needing a larger sprayer because the acreage was small. One of the reasons why we have such exceptionally fine potatoes in Rusk county is because we have a light clay loam soil. Farmers who wish to make a specialty of potato growing and have had poor or indifferent success would do well to dispose of their holdings and let them be used for other lines of farming and if they want to continue in the potato business they should come to Rusk county where the soil, climate and rainfall are peculiarly adapted to the potato crop. Fred W. Umbreit.

Rusk Co., Wisconsin.

Wants Information About Buckwheat.

To the Editor:—I would be glad to hear from any of your readers who had experience with buckwheat this past year. It seems a good many got this crop in pretty late. Also I would like to know from any of your readers what the crop paid and especially how it compared with other crops. I know a number of farmers raised buckwheat for the first time, and when the circulars were sent out urging this crop I had a notion to sow some, but did not get to it. In another year I think perhaps it will pay me, but would like to know how others have come out with the crop. Please publish it in the Mail Bag. Thanking you for the many good things in your valuable paper.

John Underlein.

Richland Co., Wisconsin.

[Let's hear from several on this topic.—Editor.]

A cow always responds wonderfully to every improvement in methods of caring for and feeding her.

Co-operative Marketing of Butter.

An Address Read Before the Dairymen's Marketing Conference Columbus, Ohio---By J. R. Morley, of Owatonna, Minnesota.

WAR prices have created considerable interest in the problem of distribution of food products. In the matter of dairy products we must go back to the producing end, as that is really where distribution begins.

To eliminate unnecessary cost, the consumer should be brought as closely as possible to the producer, and the product should be subjected to as few commissions or profits as possible to the end that the producer may get as large a proportion of what the consumer has to pay as is consistent with safe business methods.

When I say safe business methods I have in view the bringing of the farmer and city worker together without danger of financial loss to the farmer or unnecessary delay or inconvenience to the consumer. It must be obvious to all that the individual in the great centers of population in the East can never deal directly with the individual producer in the West when they are separated by a distance of from 1,000 to 1,500 miles.

There have been some advocates of dealing directly, receiving the goods by parcel post, but to my mind this is thoroughly impractical. Take, for example: Greater New York consumes daily approximately 6,000 sixty-three-pound tubs, or 378,000 pounds of butter alone. Some business may have been transacted in this way, but the volume would be so small that it would not be worth mentioning.

We have only one method by which we can reach the desired results and that is coöperative organization. So far as successful coöperative enterprises have been promoted in this country, it has, I think, been confined to the rural communities almost exclusively. The farmer has organized to better his market conditions, giving little thought to the consumer or what further channels his products passed through after leaving his local, home concern.

Many years ago the farmers in different localities became imbued with the idea that the manufacturing of dairy products could be more cheaply done under his own direction and in his own factory than by the old method of individually owned plants. The results of these efforts have exceeded the expectations of the most sanguine.

There are in the state of Minnesota alone 646 coöperative creameries and seventy-nine coöperative cheese factories. In operating these manufacturing plants the farmer is not looking for earnings from the operation, but prefers to take everything in the first payment for butter fat. As a result manufacturing is done at cost and without profit to anyone, eliminating the possible profits of manufacturing.

Having been successful in the matter of owning and operating their own creameries and cheese factories the dairymen thought it might be to their advantage to take one advanced step and get nearer to the consumer by organizing for selling in a wholesale way. As a result, a resolution was offered at the annual convention held at Owatonna, Minnesota, in January, 1907, to appoint a committee to investigate the feasibility of organizing a state selling association. As a result of the deliberations of the committee an organizaion was formed in June of that year and incorporated under the provisions of a special act of the legislature.

The name of this corporation was the Minnesota Coöperative Dairies Association, and its principal place of business is St. Paul, Minnesota. The units or stockholders are coöperative creameries, and each creamery is entitled to one vote at all stockholders' meetings, regardless of the number of shares owned by the several creameries. Eligibility to be a director consists in being a stockholder in one of the local units or coöperative creameries that own stock in the state organization. Actual business of handling dairy products was commenced in May, 1908, by appointing a broker at Chicago. The following spring similar arrangements were made at New York and Philadelphia. June 1, 1915, the agency system was abandoned at New York and the association opened its own house and operated it with salaried employes, and it is now doing business at 197 Duane street.

This organization brings the farmer directly on the wholesale market, and has possession of his goods until they pass to the jobber or retailer, or, in other words, it is direct from the farmer to the wholesale market without any intervening agencies. There is one more elimination to bring us direct to the consumer. I have spent considerable time in New York during the past two years, have studied and become somewhat familiar with the methods of distribution and believe it to be perfectly feasible to bring our products directly from the farm to the consumer. It appears that what is to be done in this direction must be done by the farmer through coöperative organization from the country end.

During the time I have spent in New York I have been unable to discover any attempt of the poorer classes to unite in a coöperative way to improve their buying conditions, which I believe they could do if they were to unite. Those people, encouraged by agitators, are more inclined to look for relief from advancing prices and high living costs through legislative

J. R. Morley,

President Minnesota Coöperative Dairies Association.

enactment, municipal markets, cold-storage plants and so forth, rather than by any effort to better their own conditions.

This agitation merely creates discontent among the working class which ultimately results in boycotts, riots and demonstrations that never bring relief. If the same energy that is spent in agitations, creating antagonism to present conditions had been spent in organizing coöperative distributing plants of their own, results might have been quite different to the consumers of New York and other large cities.

The farmers of the Northwest have taken the initiative in their own interests and created their own coöperative manufacturing plants, but no such similar movement has developed among the city consumers, so it would appear that if any further progress is made toward eliminating intervening profits it must be done by the producers. Increasing prices of the past few years and more particularly during the present war period have brought the farmer to realize that he should take more interest in the ultimate consumer, as the purchasing power of the city worker is limited.

My plan would be to add to the present wholesale distributing plants small, inexpensive retail butter, cheese and egg stores, located in different residential districts where the consumer could obtain his supplies first hand, or, in other words, buy directly from the farmer. The producer in turn could operate these various stores in the East along conservative, economical lines and the chain would be complete from the farm to the city door, giving the farmer the maximum price in selling and the buyer the minimum price in making his purchases.

I have lived among the New York people, have studied and become somewhat familiar with distributing conditions from the Battery to the Bronx, and cannot see anything impractical in the plan. The average New York housewife is a very improvident buyer, making her purchases in the smallest possible amounts, not only from day to day, but from meal to meal. They do not appear to have the remotest idea of making larger purchases in the wholesale way. Personally, I do not believe in federal or state paternalism. It is fundamentally wrong and is tending toward socialism. The controlling of products or fixing prices by government agencies, except as a war measure, is wrong and should never be tolerated by an intelligent people. The American citizen should be taught to depend upon his own resources and better his conditions by his own efforts. The western farmer can be depended upon to, in time, work out his problems to a satisfactory conclusion.

The best students of coöperation have pronounced our methods of organization fundamentally right; that is, the local units owning the larger organization instead of being individual memberships. A large or statewide organization with individual membership is unwieldy; there are too many conflicting opinions, and, in a measure, will approach mob rule, while with the plan of smaller units each sending representatives, will be a more deliberate body and better results can be obtained.

In the first instance we have what might be termed a pure democracy; in the second, a representative management, which will always get better results. With our organization of 135 creameries we can have at most only 135 representatives at a stockholders' meeting, while this same aggregation of farmers with individual membership would make a voting population of 13,000 or 14,000.

The farmers of the West are willing and anxious at all times to coöperate with the United States Bureau of Markets in bettering distributing conditions. Notwithstanding the extreme high price of dairy products, the producer is getting none too much for his product when we consider the present cost of production and he is interested in so far as possible eliminating all unnecessary expense between himself and the consumer. But it must be obvious to all that there must be more or less machinery in matters of distribution and why should not the farmer own it all? We can never hope for the urban resident to meet us half way.

Manufacturers of milking machines report an increased interest in their product manifest this year at the various fairs and live stock shows. This very likely may be attributed to the improvement in the machines themselves and also to the great scarcity of farm labor which makes their use more urgent. Experiment stations that have made careful tests with the milking machine find that it is entirely practical and satisfactory in the hands of a competent operator. In other lines of industry, particularly in the factory, it has been found that skilled labor with machinery proves cheaper and more efficient than an abundance of unskilled labor. That there has been a growing interest in milking machines indicates that the dairyman, also, is discovering this fact.

The Titan Tractor Record

A TITAN tractor is a safe machine to buy. The present models have been at work steadily on average American farms for more than two years. Their standing is established.

Ninety-six per cent of Titan owners say they are perfectly satisfied with the amount and quality of work the machines do, and with their fuel economy.

Every Titan tractor operates successfully on kerosene. You can always get a plentiful supply of kerosene or distillate, at a reasonable price.

There are two sizes—10-20 and 15-30 H. P. The 10-20 size is the one recommended for average farms. It is a three-plow outfit with two plowing speeds, 1.85 and 2.50 miles per hour, turning from 7 to 10 acres a day. You can use it for all kinds of belt work up to 20-H. P. and for hauling.

Both sizes give the same steady, reliable service. Both operate successfully on kerosene. They reduce labor costs. By getting the work done in the right way and at the right time, they increase yields.

A Titan tractor is a safe, profitable machine to buy.

To have a Titan tractor delivered in time for the harvest and the fall plowing, your order should be placed soon. Write us for catalogues.

Family Circle Talks by the Publisher

(Continued from page 3.)

left to die in the pastures, simply that men might play fast and loose with hundreds of millions of dollars and thousands of miles of rails, gambling with the nation's welfare and prosperity. The wrecking of the New Haven and Rock Island systems are malodorous chapters of our industrial history. They should never be repeated. They never could be repeated were the railroads to be taken out of the hands of the speculators and put into the hands of Uncle Sam.

There will be some who will denounce the proposition, mainly because their own interests are opposed thereby. The same men (or others of their ilk) denounced the proposal to have the United States take over the mail service and not to leave it in the hands of private parties. Every great change which has given to the government those duties previously performed by private individuals, to their great profit, has been denounced as socialistic, anarchistic, demagogic. It will be the same with government ownership of railroads. But it is coming, and it is coming soon. Transportation is an important factor in winning the war. But that is not all. It is an equally important factor in time of peace. We produced crops this year to the value of twenty-one billion dollars. Shall we let this fabulous fortune suffer and be diminished because a few financial speculators choose to gamble with railroad stocks while the people demand freight cars and while crops rot in the fields? Shall we hold aloof because the price which we must pay for the railroad equipment seemed fabulously great —before our production reached such immense proportions? A few years ago our national expenses touched the billion-dollar mark for the first time. This year they will hover around the fifteen-billion-dollar mark. We are thinking and acting in bigger units. Shall we hesitate to take over the railroads because the price we must pay seemed large a few years ago?

I believe this is an issue second only to the war. It is occupying the minds of men the nation over. Shall not we of the farm do what we can to bring it about, by discussion and agitation and by such a widespread and unanimous demand as cannot fail to be heard in Washington and be answered favorably? The people demand the right to run their own business; our railroads are a prime factor in our success or our failure, as individuals and as a nation. What argument can be advanced which can weigh against and offset our individual and national good?

SAVE THE FARM FUEL.

I WANT to urge upon all my farmer readers the importance of conserving fuel, because an adequate fuel supply is one of the most important factors in winning the war, which is the most important duty that we as a nation are facing.

Never was our coal and wood supply so important as now. Our boys may enlist to fight for the stars and stripes, but unless we have the coal to run the trains and the ships they cannot be sent to the battle front. We may work day and night making guns and shells, but unless they can be transported to where the cannons roar they are useless. It is the same with food. To produce in abundance and then to allow it to rot in the field or to waste in crib or granary is criminal carelessness. We must have fuel or we cannot win the war. We can have fuel in the required amounts if we, the individuals of this great nation, will practice economy.

The problem of fuel conservation is one especially for the farmer. The average housekeeper in the town or city is of necessity dependent upon the coal or the wood which he purchases from the retail dealer. The city man has no other alternative than to buy from these sources. With the farmer it is different. In practically every case he is dependent upon the coal dealer in the town where he trades, or the coöperative association to which he belongs, for his coal supply. But coal is not the only available or practical fuel. What of the wood which all too many farmers allow to go to waste, every stick of which would save a shovelful of coal to help send food, men and munitions to our boys in the trenches across the seas? Here is where the problem particularly affects the farmer.

I earnestly hope that a campaign of fuel conservation will be launched in every farm home to which my words carry. There are dead branches lying beneath the trees in the pasture; there are rotting fence posts and boards which might easily be collected and which would make splendid fuel for furnace and range. Dead trees, dead limbs, old fence posts, old boards—each one of these will go a long ways toward saving the coal which would otherwise be burned to heat the farm home. But that is not all. What of the coal burned in the engines used to transport coal from mines to farm homes? Burning the dead timber and waste lumber around the farm home saves this fuel of transportation, leaving a double portion to go to the task of moving men, munitions and food across the country and across the seas to France. Send the youngsters down along the river or creek, after school, to bring in the dead wood. They will be doing their bit and fuel conservation will have become an assured fact.

But the heating problem does not end here. Fuel can be saved in divers ways. A little work putting on the storm doors and windows, covering the screen doors with tar paper, using weather stripping around the doors and windows—these and other things of a similar nature will cut down the fuel consumption and at the same time make the task of warming the farm house much easier. In many cases, there is a north room which does not heat well; it is unoccupied most of the winter; why not close it off and save the heat which would otherwise go to warm it needlessly? A pan of water in a room will throw off moisture sufficient to make for health and comfort at a considerably lower temperature than is agreeable in a dry room. Most hot-air furnaces have a water pan for such purpose; keep it filled and thereby conserve fuel and the health of the entire family.

We are having unusual demands made upon us this winter for fuel. We confront a shortage of 50,000,000 tons of coal, notwithstanding the fact that production is being materially speeded. We can save these 50,000,000 tons if we will. I have seen it estimated that a kitchen shovelful of coal saved every day by every householder means an annual saving of 25,000,000 tons. I will do my share. Will you do yours?

The lives of the boys who go out from our farm homes to fight for Old Glory may depend, in the last analysis, upon the dead wood which the children bring in from the creek, to save the coal supply. The people must be roused to the situation; I am doing what I can to open the eyes of the farm folks of the grain belt. I cannot do this thing alone. Will you do your share; save and save and save until every locomotive engine in all our broad land, until every factory in which munitions of war are being made and where our raw foodstuffs are being converted into the finished product to sustain our soldiers, until every steamship leaving our shores, shall run at top speed, twenty-four hours in the day, and the war shall come to an end with the guarantee of peace and freedom which have been our richest heritages throughout all the years of our national life?

THE THANKS OF A WORTHY MOTHER.

IN ANOTHER column this week I print a few of the many scores of letters received from big-hearted men and women of the farm offering to do their bit in relieving the distress which prevails in some places because of the hard winter, the boys taken away for military service, and so on. I cannot refrain from adding another as a sort of postscript to the story told there.

One of the very first letters received by me asking for aid in the way of clothing was from a farm mother with six children. I guess I cannot do better than to reprint a portion of her letter, as follows:

Dear Mr. Pierce: My husband works out by the month. We have six children and he only gets $35 a month and his board, but has house rent to pay. We have no milk, just what we buy at the store. He does not use tobacco, neither does he drink. He is a good hand on the farm, but just because we have a family and people know he can't be idle, they won't pay any more than they can help. So if you could help me find someone that has any clothes that their children have outgrown, or shoes, I would ask God to bless and prosper you and yours for all time. We will help some other poor family when our children are grown to men and women.

It seemed to me that here was a case which demanded immediate relief, so before I could print the letter in the paper, and assistance be secured in this manner, I took the matter up with some of my associates here in the office and together we secured a box of clothing, a little something for each member of the family, adding a package of candy for the little folks, for their mother said they had had none for years, yet were never envious of more fortunate children. We sent this box without delay and today a letter of acknowledgement came to us. I want to print this letter, withholding only the name and address of the woman —which can be had by anyone who wants to add to our little mite and still further help her and her family. The letter needs little, if any, comment. It is a volume of thankfulness written from out a full heart. Here it is:

Dear Mr. Pierce: I received the box all O. K. I wish you could have been here to see the children. We just got word Saturday morning that it was at the depot, so we went Saturday afternoon. We were indeed glad to get the things and thank you more than I can tell you in a letter. The baby, Sarah, said: "We will have to tell God, won't we, papa?" Every piece will come in good play, for I can use them. Those two suits for a lady just fit me, only the skirts are a little long. The children are saving the candy for Christmas. As you have been so kind I will give you the children's names: Laura Esther, thirteen years old; Lawrence Pleasant, aged twelve; Wayne Albert, aged eleven; Cora Anna, aged eight; Beulah Gertrude and Sarah Lucinda (twins), aged four. I hope you can make other people as happy as we are; and may God bless and save everyone who is in such good work is the prayer of this entire family.

What need I add to this letter; so genuine that the heartbeats of a relieved mother can be felt in every line? I read it over and over again, with genuine yuletide happiness. Shall we not all of us do all that we can to drive care, sorrow and want away from such a household and in their place bring happiness and comfort? Next year we must enlist, every one of us, in a movement to bring Christmas cheer to every needy and deserving man, woman and child throughout all the countryside. Will you enlist with me, thus early?

James M. Pierce

IN AND AROUND WISCONSIN

The winter term of the school of agriculture at the University Farm, St. Paul, Minnesota, begins January 7th. This course offers special advantages for young men from the farm, seventeen years of age or over, and in addition to the regular courses military drill will be available to such as desire to fit themselves for army service later.

The Calumet County Holstein-Friesian Breeders' Association held a successful meeting in Chilton, December 1st, and increased its membership by eighteen. This organization now represents 150 pure breds and 500 grades. Secretary Hampke, of the Manitowoc County Association, was present and addressed the meeting. President McGrath, of the Calumet County Guernsey Breeders' Association, also spoke and an interesting letter from Senator Standenmayer was read. In calling the meeting to order Pres. A. T. Hipke urged coöperation among the breeders and said that it was time to stop the "cut-throat methods" which have been in vogue. Mr. Hipke called attention to the responsibility which the world war placed upon Wisconsin farmers, dairymen and breeders and from the interest manifest at the meeting it is apparent that the farmers and breeders in Calumet county intend to do their part.

The Journal of Soil Improvement, published quarterly by the Wisconsin Soil Improvement Association and edited by members of the staff in the Wisconsin College of Agriculture, is making a strong drive to accomplish better handling of acid or sour soils. A statement is made in this journal that over two-thirds of the land area of Wisconsin or over 23,000,000 acres, is acid and needs lime. Liming is recommended as the first step in the improvement of soils which are sour. Liming not only adds materially to the productiveness of the soil by correcting acidity, but it also adds greatly to the effectiveness of all other soil treatments and often doubles the yield of clover and other legumes. The state soils laboratory at Madison was organized for the purpose of helping farmers to understand the needs of their soils. Our readers have the privileges of this laboratory under favorable conditions and should take advantage of the service which is offered.

A. C. Townley, of the National Non-Partisan League, recently visited Washington and asked President Wilson to urge upon congress an appropriation of $50,000,000 for the purchase of seed and feed to be sold at cost to farmers in the Northwest. During the conference, according to an Associated Press Dispatch from Washington, Mrs. Townley pledged to the president and our government the allegiance of northwestern farmers and declared that they desired to do everything in their power to aid the government in winning the war.

The Dane County Fair Association has reëlected Pres. F. Pierstorff, vice-president William Fehlandt, secretary M. M. Parkinson, and treasurer C. A. Hanan. The 1918 Dane County Fair is to be run on an even larger scale than usual. This fair is coming to be recognized as one of the best county fairs in the state.

According to a statement made by J. F. Wotja, Wisconsin raised 21,000 acres of sugar beets in 1917. Three to five acres is the usual size field. One advantage in sugar beets is that the farmer knows in advance what price he will get for the crop. The prevailing price in 1917 was $8 per ton. Yields run from six to twenty-four tons to the acre. So much labor is required that it is not practical for the average farmer to plant a very large acreage to sugar beets.

Serious Session of Fruit Growers.

Wisconsin State Horticultural Society Accepts the Broad Responsibilities of the Hour and Will Aid in Campaign for Bigger Food Supply from the State.

CONFRONTED with the war-time duty of developing to the utmost the commercial fruit and vegetable industries of the state on the one hand, and assuming direct leadership in teaching intensive home gardening as well, the fifty-second annual convention of The Wisconsin State Horticultural Society held at Madison, December 11-13, took on a most serious and deliberate tone. Sessions were held in the state capitol.

At the outset of the convention the keynote of the situation was expressed by Secretary Frederic Cranefield, who emphasized the fact that it is now the absolute duty of every public or semi-public organization concerned in the production of food to postpone for a time such activities as relate only indirectly to that problem, and put extra force into methods of increasing and conserving the commissary stores.

In this line of work the State Horticultural Society has taken a leading part. It was the first in the field with a publication intended to aid the amateur gardener, namely, the special edition of the society's magazine, Wisconsin Horticulture, which was mailed to members and others interested on April 17th.

This initial drive for better home gardens as national food defense measures was quickly followed by the organization of The Wisconsin Gardener's Advisory Council, a group of volunteer workers who directed local efforts in fruit and vegetable growing.

Secretary Cranefield declared that nothing in his fourteen years of service as an official of the society equals the spirit and results accomplished by this brigade of garden guardians.

Brief reports were noted of the war garden activities of the following members of the council:

H. Kaufmann, Marshfield; William J. Hansche, Racine; Hon. Jay F. Lyon, Elkhorn; J. T. Fitchett, Janesville; Melvin Haynes, Sawyer; John D. Jones, Platteville; Scott S. Dey, Wyocena; C. A. Hoffmann, Baraboo; Dr. A. H. Lemke, Wausau; E. Haywarden, Superior; N. E. France, Platteville; Mrs. Coley Strong, West Allis; John J. Blaine, Boscobel; Irving Smith, Ashland; Conrad Engsberg, Lake Mills; E. H. Niles, Oconomowoc; C. W. Meisnest, Manitowoc.

Members of the Gardener's Advisory Council went on record at the convention as firm believers in the ultimate good of the movement in which they were engaged, and pledged to continue the work with added reinforcements next spring. Many of the members stated that winter garden conferences have been planned in their districts in order to review the past season's successes and failures and create wider enthusiasm for future work.

They believe that the sum total in production from 100,000 well worked tenth-of-an-acre gardens is of greater economic importance than 10,000 acres devoted to market gardens. Mr. Cranefield said that Wisconsin does not have quite 5,000 acres devoted to commercial vegetable gardening, while it is not an overstatement to place the Wisconsin home garden area cultivated in 1917 at 200,000 gardens of one-twentieth of an acre each, or 10,000 acres.

Wisconsin Grown Wealthies.

Wives of the visiting delegates and others interested in county council of defense garden movements lent aid to the program. Mrs. H. H. Morgan, chairman of the women's committee for Wisconsin of the National Defense Council, spoke in support of the statewide garden movement, as did Miss Abby L. Marlatt, head of the home economics department at the University of Wisconsin and home economics representative of the United States Food Administration.

Mrs. Morgan uged closer unity and more thorough local organization of all women to the end that war work may become a vital part of home life and ambitions. Miss Marlatt dwelt in particular upon the conservation of fruits and vegetables, and asked horticulturists to support all present and future plans based upon intelligent and rational methods of kitchen economy. Miss Marlatt placed the services of herself and members of the home economics staff at the university at the disposal of women engaged in all phases of food thrift.

Mrs. C. E. Strong, of West Allis, presented the results of the war garden movement in that city. There during the past summer the loyal populace, aided by public information from the State Horticultural Society and the College of Agriculture, planted and cultivated fully 1,200 gardens, averaging 60 by 120 feet in size. Similar accounts of personal interest and devotion to back-lot farming were outlined by Mrs. J. J. Ihrig, Oshkosh, who gave a brief synopsis of the garden plans mapped out for that city next season.

N. A. Rasmussen, president of the society, aided by A. Martini, Lake Geneva, secretary of the Walworth County Foremen's and Gardeners' Association, then provided some technical information to aid the directors of forthcoming garden campaigns. They explained soil requirements and soil management, and gave hints on early crops, succession crops, and the storage of different varieties of fruits and vegetables. Next spring both Mr. Rasmussen and Mr. Martini, through the society's publication and by means of special lectures, will continue to lend help to the cause in many parts of the state.

Owing to the severe weather many of the numbers scheduled on the progrom had to be omitted. The illness of two members of the society also reduced the exhibits somewhat. The display of Wisconsin grown apples and vegetables in the rotunda of the second floor of the capitol was, however, worth coming long distances to see. Hardly without exception, the exhibits of apples were placed by commercial growers, and represented the best products of the Bayfield peninsula, Door peninsula, the Lakeshore district, from Kewaunee county southward to Milwaukee county, and including choice specimens from the famous Kickapoo Valley orchards of Crawford county. Sauk county, with A. K. Bassett, of Baraboo, as its champion, came through the ordeal with a long string of prizes to its credit. Jefferson county was represented no less thoroughly by Freemont Lounsbury, Watertown, who likewise made some "cleanings" in standard varieties.

Nevertheless, there still continues to be a lamentable lack of interest in the annual state apple and fruit show, a fact not easily explained in a casual manner. Some attribute this indifference to a lack of suitable premium awards; some say it is due to the more pressing duties brought about by the national call to arms; while still other members believe the state fair and county and district horticultural shows have weaned away some of the faithful. Judging of exhibits was left to members of the horticultural department of the University of Wisconsin, J. G. Moore in charge.

Some interest was attached to the annual report of the trial orchard committee, William Toole, senior, Baraboo, and M. S. Kellogg, Janesville. In addition to maintaining a trial vineyard at Sparta for the past seven years, the society has eight different test orchards leased and under its personal management. In this work the Wisconsin society leads all other state horticultural associations. The orchards are maintained for the sole purpose of determining to a nicety the sections of the state which can be recommended for this branch of food production on a commercial scale.

The vineyard at Sparta will be abandoned. After seven years' trial the society has found that grapes cannot be grown commercially with any assurance of success in that region. The decision need not act as a check on the efforts of home growers, however, the committee stated, but the fact remains, nevertheless, that only one

Wm. Toole, Sr., Baraboo,
A Veteran in Horticultural Society Work.

N. A. Rasmussen, Oshkosh,
President of the Wisconsin State Society.

D. E. Bingham, Sturgeon Bay,
Vice President of the Wisconsin State Society.

Frederic Cranefield, Madison,
Secretary of the Wisconsin State Society.

profitable crop of grapes suitable in every way to Wisconsin conditions could be produced during the seven years in which the Sparta plot was in operation. The best of care and attention was given the project from the start.

The orchards are located at Gays Mills, Lake Geneva, Pewaukee, Manitowoc, Poplar and Maple, (Douglas county), Weston, Dunn county, and Holcombe, Chippewa county. The orchards at Poplar, Holcombe and Maple are distinctly "trial" orchards, while the remaining ones, located in sections where tree fruits are known to thrive and bear well in good seasons, are termed "model" orchards. Here the demonstrations in spraying, pruning and soil culture are carried on.

An account is opened with each of the model orchards with the expectation that a decided margin of profit will be shown at the end of ten or twelve years. The orchard should then yield profitable crops for twenty years longer with but moderate expense for maintenance. In this way the society hopes to demonstrate the possibilities of fruit growing in Wisconsin without the shadow of a doubt.

The orchard at Poplar, seven acres, is in the heart of the red clay region of northern Wisconsin. There it is proposed to work out the tree-fruit problem for the thousands of settlers who are now on the land and for the sake of others to come. The five-acre orchard at Holcombe, Chippewa county, in the words of the secretary, "would seem to have no rational excuse for existence in the light of our earlier experience with orchards at Barron, Medford and Eagle River, but we may yet be able to raise apples on the hilltops and ridges of this peculiarly broken country. At least we will try." The Weston orchard in the Big Woods of Dunn county, is favorably located, the soil, elevation and drainage resembling those of the orchard at Gays Mills—the one which leads all others thus far in yield and profit.

The Wisconsin apple grading law, which makes compulsory the exact grading and packing of all apples for sale in the state, was discussed, and seemed to meet the hearty approval of the members. It is the first law regulating the fruit industry to be placed on the statute books in Wisconsin, and Dr. E. D. Ball, of the state department of agriculture, has charge of its administration.

The discussions brought out the fact that the law must be respected and upheld if for no other purpose than to open the way for further favorable legislation. To disregard the provisions of the law, which provide that all apples consigned to the regular box and barrel channels of trade must be marked according to four classified and one unclassified descriptions, would be suicide to the progress of Badger horticulture.

The future of Wisconsin horticulture and some things it must stand for was the subject of an address by J. G. Moore, college of agriculture. Mr. Moore's keynote was that Wisconsin commercial fruit growers must aid farmers in adopting better methods of caring for their home orchards. The commercial man has in some cases, Mr. Moore believes, been loath to impart his trade secrets or give useful suggestions to neighboring farm orchardists for fear that these private fruit growers might in time come in line for competition in the open market with a product equal to his own.

He said that the most significant thing in recent horticultural circles in Wisconsin was the awakened interest evinced by the average farm orchard owner in properly caring for his trees. With this in mind, Mr. Moore urged all commercial growers to at least "practice what they preach on their own holdings."

They must spray and prune and cultivate their orchards for the benefit of their farm neighbors as well as themselves. The speaker pointed out that the danger of possible competition from strictly amateur-grown fruit need not worry the commercial grower.

This is true because of two things, he said, namely, that a commercial man really suffers the most damaging 'ort of competition when lots of in-'ior, scabby fruit is thrown on the 'ket. The poor stuff sets the price .evel. Then the premium price above that level which the commercial man gets for his improved article may not be as high relatively, after all, as would be the case in a market where plenty of excellent fruit establishes a higher average price level to start with. The other point is that consumption and demand are always greater and more even when an abundance of high-grade stock is on the market for the public to admire and buy more generally and readily.

Strawberry culture, particularly that of the late varieties, was discussed by M. S. Kellogg, Janesville. These everbearing, "double-barreled" varieties will yield a late summer crop of excellent quality with the proper care. They have probably shown success as a home garden crop rather than a commercial proposition in Wisconsin thus far in the trials, Mr. Kellogg stated. Their backwardness in securing public favor as a dependable commercial crop was laid to the strong competition which the everbearing kinds must face in a market glutted with peaches, pears and early apples. From now on the success of the everbearing kinds depends solely upon a vigorous campaign of education, to set the public at rest as to their merits and calling the housewives' attention to the fact that all home-grown strawberries are not gone by the second week in July. Mr. Kellogg also urged farmers to consider small fruits more carefully next spring, as they would aid the sum total of food production on odd corners of the farm at little expense in time and a relatively small labor outlay, results in average seasons considered.

The best varieties, honesty and care in packing—with or without a state law—were the maxims for successful commercial apple production set forth by A. K. Bassett, well-known Baraboo fruit farmer. When Mr. Bassett bought his present farm it contained a fifty-year-old, neglected orchard. He cleaned, renovated, sprayed and pruned and has since set out sixty-five acres to apple trees. Although receiving an average of $6 a barrel this season, f. o. b. Baraboo, for his winter stocks, with less valuable kinds selling for 75 cents a bushel, containers returnable, Mr. Bassett complains of labor shortage as a drawback to expanding his business just now. His earlier varieties are the Snow or Fameuse, McIntosh, Wealthy, Northwestern Greening and the extra early Duchess of Oldenburg. For strictly winter keeping qualities, he supplies his trade with Salome, Windsor, Russett and Tolman Sweet. All these he has found adapted to south-central Wisconsin conditions over a period of ten years. Mail order shipments direct to consumers took 40 per cent of his crop this year, and dealers in northern and western Wisconsin towns took most of the remaining lots.

Not forgetting the side of home life which ministers to the soul, and helps to imbue a stronger love of country, talks on farmstead planning for beauty as well as utility were given by F. A. Aust and Cecil Britt, University of Wisconsin. Mr. Aust explained the elements to be sought in landscape architecture, using good, hardy Wisconsin vines and shrubs advocated by the college of agriculture and the horticultural society. Mr. Britt, a veteran gardener who comes from Warwickshire, England, with much lore about rose culture, gave the society an interesting ten-minute talk on the chief things which Wisconsin must look for in the successful growing of the national flower of Albion.

R. H. Roberts, of the university horticultural department, in his paper on the cause and control of winter injury to cherry blossom buds, attributed it chiefly to the condition of the buds when winter starts. The more developed the buds are at this season the more susceptible they are to harm. These observations lead one to conclude that much of the winter injury common to older, weaker-growing trees could be prevented by maintaining a more vigorous tree, and thus arrest the extreme development of the blossom buds to the stage at which they are found to be very subject to frost.

More action for central frost-proof warehouses where cranberries could be sorted and shipped with less delay and loss due to frequent and careless handling is the crying need of Wisconsin, said E. K. Tuttle, Tomah, in a brief discussion. At present each grower in the Badger cranberry area works practically alone in his own warehouse in spite of greatly improved conditions brought about by recent successful organizations. Wisconsin raised between 20,000 and 30,000 barrels of cranberries this year, Mr. Tuttle says. Most of the larger, fancy varieties are shipped west, although Chicago annually receives much Badger stock.

Excellent progress in control investigations with respect to the cherry leaf spot was reported by G. W. Keitt, plant disease specialist, University of Wisconsin, who has been conducting coöperative experiments with Door county growers for the past three years. Turning under of dead leaves before blossoming time, plus two, sometimes three spray applications later in the season works wonders against this disease of the cherry. Mr. Keitt and coöperating growers found that three pounds of copper sulphate mixed with three pounds of fresh lime to fifty gallons of water was as effective for commercial control of cherry leaf spot as the 4-4-50 solution. In times of high prices for spray chemicals this means quite a saving besides. The only possible substitute for Bordeaux mixture in times of high prices is lime sulphur, Mr. Keitt says. This, at the rate of five to six quarts to fifty gallons of water in combination with arsenate of lead for insect control, is advised.

An incident of the meeting was the election of officers. N. A. Rasmussen, Oshkosh, was chosen to succeed himself as president; J. A. Hays, Gays Mills, was chosen vice president, while William Toole, Jr., Baraboo, was elected treasurer, and by unanimous vote of the executive committee, Frederic Cranefield was placed again in the secretary's position, a place he has filled for nearly fifteen years.

A representative of The Wisconsin Farmer took pleasure in reminding the executive committee that the first official farm journal report of the initial meeting of the State Horticultural Society, then termed "The Wisconsin Fruit Growers' Association," was recorded in the issue of The Wisconsin Farmer for March 1, 1865. This took the form of a condensed report of the first meeting, signed by J. C. Plumb, Madison, secretary.

The following is a list of the first and second premiums on fruit classes at the show, with the exception of the cranberry division, in which there were but a few exhibits and no judges who could qualify:

Best collection of apples, not less than fifteen varieties, A. K. Bassett, Baraboo; Freemont Lounsbury, Watertown.

Five plates commercial varieties of Wisconsin apples, Kickapoo Valley Development Company, Gays Mills; H. H. Harris, Warrens.

Plate Ben Davis, Carl J. Baer, Baraboo; J. A. Hass, Ellison Bay.

Plate Fameuse, A. K. Bassett; Carl J. Baer.

Plate Gem, A. K. Bassett; L. B. Irish, Baraboo.

Plate Gideon, Freemont Lounsbury; F. B. Sherman, Edgerton.

Plate Golden Russett, A. K. Bassett; Kickapoo Valley Development Association.

Plate Grimes Golden, Arno Meyer, Cascade; F. B. Sherman.

Plate Jonathan, Freemont Lounsbury; A. K. Bassett.

Plate Maiden Blush, N. A. Rasmussen, Oshkosh; Freemont Lounsbury.

Plate McIntosh, Kickapoo Valley Development Co.; A. K. Bassett.

Plate McMahon, Freemont Lounsbury; H. H. Harris.

Plate Newell, Kickapoo Valley Development Co.; C. J. Baer.

Northwestern Greening, Kickapoo Valley Development Co.; A. K. Bassett.

Plate Pewaukee, A. K. Bassett, N. A. Rasmussen.

Plate Plum Cider, Freemont Lounsbury; A. K. Bassett.

Plate Salome, H. H. Harris; Rudolph Schultz, Lake Mills.

Plate Seek-No-Further, A. K. Bassett; Freemont Lounsbury.

Plate Scott Winter, Carl J. Baer; H. H. Harris

Plate Tolman, Carl J. Baer; A. K. Bassett.

Plate Delicious, D. E. Bingham, Sturgeon Bay; L. E. Birmingham, Sturgeon Bay.

Plate Utter, A. K. Bassett, Freemont Lounsbury.

Plate Wealthy, Carl J. Baer; H. H. Harris.

Plate Wolf River, Carl J. Baer; Kickapoo Valley Development Co.

Plate York Imperial, A. K. Bassett; Freemont Lounsbury.

Peck Ben Davis, A. K. Bassett; Freemont Lounsbury.

Peck Fameuse, Carl J. Baer; A. K. Bassett.

Peck Gem, A. K. Bassett; L. B. Irish.

Peck Golden Russett, A. K. Bassett; C. J. Baer.

Peck McIntosh, Kickapoo Valley Development Association; A. K. Bassett.

Peck Newell, Carl J. Baer; A. K. Bassett.

Peck Northwestern Greening, Kickapoo Valley Development Company; A. K. Bassett.

Peck Plum Cider, Freemont Lounsbury; A. K. Bassett.

Peck Seek-No-Further, A. K. Bassett; Freemont Lounsbury.

Peck Scott Winter, Carl J. Baer; H. H. Harris.

Peck Tolman, Carl J. Baer; A. K. Bassett.

Peck Utter, A. K. Bassett; Freemont Lounsbury.

Peck Wealthy, Kickapoo Valley Development Co.; L. B. Irissh.

Peck Wolf River, C. J. Baer; N. A. Rasmussen.

Bushel Northwestern Greening, C. J. Baer; Freemon Lounsbury.

Bushel Wealthy, C. J. Baer; Kickapoo Valley Development Association.

Bushel Fameuse, A. K. Bassett; L. B. Irish.

Exhibit of crabs, Freemont Lounsbury; A. K. Bassett.

This coat made to order from hides sent us for tanning.

WE TAN HIDES

AND SAVE YOU 50%

Have your hides made up into useful and valuable articles—coats, fur sets, gloves, mittens, caps, robes or rugs. Anything you want can be made to your order and at a saving of 50% or more. Our 30 years' experience is worth money to you—it means dependable, first quality work. Write for our book of suggestions and prices today—it's free.

JOHN FIGVED ROBE & TANNING COMPANY
2952 Forest Home Ave.
MILWAUKEE WISCONSIN

Cedar Rapids Tanning Co.

Tanning Department of Cedar Rapids Hide & Fur Co.

Iowa's Largest Hide, Fur and Wool Dealers.

You will realize more money for your hides and furs from us than elsewhere, as you are selling direct to tannery, thereby saving the middleman's profit. Our tanning of all kinds of hides and furs and manufacturing of coats, robes, rugs and mittens cannot be equaled. Send for our illustrated catalog on tanning and price list on hides and furs. Ship hides and furs for sale to Cedar Rapids Hide and Fur Co., and hides and furs for tanning to Cedar Rapids Tanning Co., of Cedar Rapids, Iowa.

(Cedar Rapids' only tannery.)

TRAPPERS

A trial shipment will convince you that we pay the highest prices for Furs, Hides, Pelts, etc. We remit you the day your shipment is received and charge no commission.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

Questions and Answers.

Power Crosscut Saw.

You recently published a plan of a power crosscut saw. I have a crosscut saw forty-eight inches long and I would like to make a saw frame to run it with a two-horse-power gas engine. Please give the dimensions of the wood pieces and disk wheel. How fast can I run it?

Answer.—It would be best to make the frame out of 4x4 yellow pine or any hard wood, though the lighter pieces could be 2x4's. The rocker arm may be made from a 2x4 piece of oak. It should be about three feet long, the pivot hole being bored about two feet from the saw end. The crank disk should be about twenty inches in diameter, the crank pin being located seven inches from the center of the disk. The crank disk should run seventy revolutions per minute.

Priming a Ford Car.

I have a 1917 Ford car. If I put a priming cup on the intake manifold to prime it in cold weather, would it prime the four cylinders all at one time? Would it be of any use to open up the priming cup in warm weather? Would this method injure the motor in any way?

Answer.—This method of priming should be satisfactory. While it may not prime all the cylinders uniformly, it will prime them enough to start the motor easily. There would be no advantage in opening the priming cup in warm weather; in fact, your motor would not run well at all speeds if you did. Installing a priming cup on the manifold should not injure the motor in any way, but care must be taken not to allow any of the drillings or other dirt to fall into the carburetor or cylinders.

Dry Cells for Lighting.

Will you please tell me how to connect dry cells to an ordinary reading lamp? How many cells will it take and how long will they last? The lamp will be the size generally used.

Answer.—It is not practical to run a reading light from dry cells, as the cost would be over 25 cents per hour for a sixteen candle power light, the size commonly used. You would require not less than thirty dry cells, connected in series-multiple, five in a series, using a twenty-watt six-volt light. That is, you would group your cells five in a set, connecting the cells of each set carbon to zinc. Then connect all the remaining carbon terminals to one lead wire and all the remaining zinc terminals to the other lead wire. Run one of the lead wires to a switch and from the switch run a wire to the light. Then run a wire from the light back to the other battery lead wire.

Patent on Two-Wheeled Tractors.

I would like to have some information as to whether the idea of a two-wheeled tractor is patented by the Moline Plow Company. I am planning to make a two-wheeled tractor out of a Ford chassis, and I would first like to know whether the idea is patented.

Answer.—There are many patents on tractors and the only sure way to avoid infringements would be to have a competent patent attorney look up the records in the patent office. Our understanding is that the idea of making a tractor with two drive wheels is not patented, but that the Moline Plow Company have various patents covering the steering device and general design of their tractor.

Some Tractor Questions.

I am interested in buying a tractor, and do not know just what to buy. Is there any four-cylinder motor that is a successful kerosene burner? Even with low compression, I am informed that no engine can use kerosene successfully unless the mixer or carburetor is on the side of the engine level with the intake pipe, as they say that kerosene cannot be drawn up any distance. Is there any foundation for the statement? Does a four-cylinder motor stand up as well as a two-cylinder motor? Which develops the more power according to the rating? Which is the more expensive to keep up? Which uses the most fuel; one, two or four-cylinder motors? Is a two-cylinder engine that has opposed cylinders as powerful and as good a burner of kerosene as a twin cylinder motor with mixer on top of the cylinders? Is there a successful kerosene engine, one or two cylinders, that works O. K. with the mixer at the bottom of the cylinders?

I have three tractors in view, a four-cylinder 5x6 engine, speed 725 R. P. M., speed two and one-half miles per hour, rated 12-24 horse power, straight gear drive, weight 4,800 pounds, 3,000 pounds draw bar pull on high gear, 4,000 pounds pull on low gear; a two-cylinder 7x8 engine, speed 425 R. P. M., speed three miles per hour on high gear, rated 12-24 horse power, weight 6,500 pounds; and a single-cylinder engine 9x12 speed 450 R. P. M. rated 18-35 horse power, speed three miles per hour weight 4,200 pounds. If this engine is not overrated, it should pull four twelve-inch plows at three miles per hour. Which of these would you recommend for me? I want to use it on a feed grinder that requires a twenty-five-horse-power engine.

Answer.—There are several four-cylinder tractors that handle kerosene successfully. It is a mistaken idea that the kerosene carburetor must be placed level with the intake pipe. For instance, the Moline Universal is often fitted with a kerosene carburetor located several inches below the intake manifold, with the further handicap of a very long intake manifold; yet this outfit handles kerosene very successfully. It all depends upon the design of the equipment. If the air and kerosene are properly heated, but little trouble will be experienced in burning kerosene.

How long a motor will stand up depends upon the design and workmanship rather than upon the number of cylinders. Other things being equal, the four-cylinder motor should stand up the longest, due to a more even strain on the parts. On the other hand, the one or two-cylinder engine has fewer parts to cause trouble. The general trend of tractor design is toward the four-cylinder motor. The rating is purely a manufacturer's guess, and is no comparison between various types of motors. The fuel consumption per horse power is more a question of good carburetor adjustment, and good timing and compression rather than a question of how many cylinders. Other things being equal, the single-cylinder engine should be the more economical, as there is less heat loss due to the larger cylinder diameter. Other things being equal, there is no difference between the power of an opposed cylinder engine and an engine having the cylinders side by side.

Without knowing the make or model of the tractor you are considering, we would choose the four cylinder as the most suitable. Much depends upon the design and workmanship; and we would advise you to go into the construction of the various tractors in detail and also consider dealer which can give you the better service on repair parts. This is a very important matter, especially when the tractor is used for plowing.

A Spark-Plug Tester.

I have seen in a garage a homemade outfit for testing engine spark plugs for cracks and leaks in the porcelains. By turning on the electricity, you can see the spark jump through the porcelain instead of across the gap between the points. Please explain how such an apparatus is made.

Answer.—The arrangement of this apparatus is shown in the figure. I is an iron plate bolted to the top of a wood box, the edge of the plate overhanging the box. In this overhanging

plate a hole is drilled to take the threaded end of the spark plug. It is not necessary to have the hole threaded. A jump spark coil is also mounted on top of the box. Inside the box are five dry cells connected in series. S is a brass strip on the end of the box, serving as a switch. A regular switch could be used.

The bolts Q and R should be brass. The wiring is shown in heavy black lines. When the switch is closed the spark appears at the points of the plug if the plug is good.

Raises Good Litters.

To the Editor:—I was amused and interested when I read about how to raise large litters of pigs and how to get the sows to exercise. I have raised hogs for forty years and I have no trouble raising large litters and saving them, and no trouble about the sow exercising.

In the first place, select long, lengthy dams, with a sire to match. Don't keep the dams too fat. Let thm run after the cows in the winter and they will exercise. Let them run thus until about two weeks before farrowing time, then shut them up in a hog house, each one in a place by herself. Don't feed too much grain. If you want to slop your hogs after farrowing time, slop them for two weeks before farrowing time and then it won't hurt the pigs. Don't give them much bedding so they can burrow under it. Aim to have the sows farrow about the first of March and select your choice for fall farrowing out of the March litters. I have practiced this for several years and have raised on an average of ten pigs per litter and saved them. Have the fall pigs as early as possible so as to avoid a lot of runts and scabs. I would rather have spring pigs than to have fall runts. T. L. Boozell.

A Wisconsin Farmer subscriber, Mr. Eugene Jordan, of Spooner, Wisconsin, would like to rent a farm where all the live stock and equipment are supplied by the farm owner. He states that he would be in a position to take the place of someone who had to leave the farm because of the military draft.

Handle Water By Machinery

Figure the total cost of the labor-saving machinery you use in seeding and harvesting. It is money well spent, though you use this machinery only a few weeks in the year. Yet you still lug water by hand just as your grandfather did. Cut out this hard work and waste of time. Put in a water system and handle water BY MACHINERY. The

Milwaukee Air Power Water System

works every day of the year and supplies tons of water "Direct from the Well" for cooking, scrubbing, washing—for watering the stock, for the bathroom and the dairy. It pays for itself in a year or two.

You can have hot and cold, hard and soft water anywhere you want it. Just turn a faucet. No pumping and carrying. No stale stored water and NOTHING TO FREEZE.

The MILWAUKEE PUMPS are remarkably simple and the whole system is as reliable as any other farm machinery. It is the best investment you can make.

Get this FREE Catalog

Also ask for the Information Blank, which enables you to learn just what a water system for your place will cost. Send postal today.

The Farmer's Concrete Mixer

SHELDON Batch Mixer Price $11.50 Up

The Sheldon was designed especially for the farm. Highly praised by users. Farmers everywhere call it the ideal mixer. Used today all over the United States. A big success. Small enough to be easily moved—big enough to keep 6 men busy. Low in price. Build your own silo, tanks, troughs, floors, foundations, buildings, etc., out of concrete with a Sheldon Batch Mixer.

Read What These Sheldon Owners Say

I and my hired man laid a feeding floor for my hogs, 24x24, in one day; also put floor in my cow barn. My neighbor liked it so well I am not able to keep it at home—ANDREW CHRISTENSEN, Hancock, Minn., Rt. 1.

We have used the mixer during past year for putting in cement foundations for a complete set of farm buildings, including silo, and like it very much—DANA WRIGHT, Jamestown, N. D.

Last year I bought a cement mixer from you with which I am well satisfied. It did not take long for it to pay for itself and I surely can recommend it to anyone needing a *big mixer at a small price*—WM. PARRS, Martinton, Ill.

I am more than busy with my Sheldon Concrete Mixer. Have more work than I can do. *I get $10 a day when I work out*—JESSE L. WITTER, Wellsville, N. Y.

The machine works fine. Have already *got the job* of mixing concrete for the bridges in this township—JOHN ROSE, Spartansburg, Pennsylvania.

Last spring we purchased of you a set of castings to make a concrete mixer. It was constructed per the plans furnished and it *surely worked great*—D. M. BRUBAKER, Freeport, Ill.

FREE PLANS

Make your own concrete mixer. You can do it at a cost so low you can not afford to mix concrete by the shovel method. Along with our iron parts we send Free Plans and permit for making your own machine. A good way to get a practical mixer at a small expense. Or, we will sell you the complete machine, ready built.

Make Big Money at Concreting

If you buy a Sheldon Mixer for your own use, you can make many times its cost in a season by renting it to your neighbors. Or, if you want to go out with the mixer on contracts, you can easily earn $8 to $20 a day. Our customers are doing it right now. The jobs go to the man with a Sheldon Mixer every time.

Write For Our New FREE Catalog

Shows our full line of mixers which are sold direct to you on strong guarantee. *Thirty days trial* privilege. No other like it. Patented. Two styles, hand and power. Mixes 2 1-2 cubic feet a minute. One man can operate it, but it will keep 2, 3, 4, 5 or 6 men busy. Continuous chain drive. Tilting dump. Easily and quickly moved. All parts guaranteed. Does work equal to $400 mixers. Be sure to get the catalog. Write today.

My New Special Offer

I want to tell you about my co-operative plan by which you can get my time-tried, thoroughly proven Sheldon Batch Concrete Mixer at little or no cost to you. I want ten men in every county to accept my special co-operative offer right now. Are you going to be one of the ten? Write and say: "Send me special offer."

The Sheldon will pay for itself on first small job. Takes the backache out of concrete. Makes possible these many small improvements that add so much to the value of your land.

SHELDON MANUFACTURING COMPANY, Box 4798 Nebawka, Neb.

No Money In Advance

A FULL YEAR TO PAY

Nothing to pay for 60 days—then only first small payment if you accept our offer on famous Majestic Engine.

Most powerful engines for their H. P. rating. Any size you want. Fewest parts, most durable, most economical. You can prove it before you buy or send a penny. Thousands of Majestic Engines in use.

30 Days Free Trial We will send any size engine you want. Send no money in advance, take 30 days' trial, then if satisfactory keep the engine, make first payment 60 days after its arrival, pay balance in payments 60 days apart. Return the Majestic at our expense if not the best engine you ever saw. Send post card now for FREE CATALOG, prices, no money in advance or terms and our special offer. Let us send you valuable inside facts about gas engines—all free. Write now.

GET INTO THE ALFALFA BUSINESS

(Continued from page 1.)

lime often spells the difference between absolute failure and success and failure. In such cases it may be worth 100 times the original investment. Remember this:

(1) You can't grow the biggest crops of alfalfa on sour or acid soil. You can grow good crops of corn on land that is too sour to grow a half ton of alfalfa hay to the acre.

(2) Some fertile soils will grow alfalfa even though the soil is acid, but the stand would last much longer if the soil were sweetened with lime.

(3) Lime takes the sourness out of the land and makes the soil conditions right for alfalfa.

(4) Your soil may not be sour. It may not need lime, but don't take a chance! Test it and find out! It's easy. Use litmus paper, or, better, have your soil tested by the Truog method, which tells you the exact amount of lime necessary to make the soil right for alfalfa. Your county agent or the experiment station will test it for you free of charge.

Ground limestone is probably the cheapest form to use. Air-slaked lime is very satisfactory when it can be obtained cheaply. At least two tons should be used. More may be necessary, but the Truog soil test will tell you the amount required. Here are five good lime regulations:

(1) Always put lime on the surface of plowed land and disk or harrow it in.

(2) Lime sandy soil in the spring. Heavier acid soils can be limed in the fall, winter or spring.

(3) Lime can be spread with a shovel or by means of a manure spreader or a regular lime distributor.

(4) It pays to buy lime in carload lots. The freight costs less. Get together and order a carload.

(5) If you are using coarse ground limestone remember it takes an extra ton or more an acre to be equal to the finely ground limestone.

Inoculation.

The alfalfa order will supply its members at cost price of 25 cents an acre fresh inoculation cultures which can be applied to the seed before sowing and which will inoculate the alfalfa plants with the right life-giving bacteria to promote the most rapid growth and the best yields. Not every field needs inoculation, yet poor results often occur where the soil does not contain the right bacteria for alfalfa. Sweet clover is a first cousin of alfalfa and has on its roots the same germs and nodules as alfalfa needs. Fields near the roadside where sweet clover is growing seldom need inoculation because dust from the road carries bacteria to adjoining fields.

The soil method is the surest way of getting fields inoculated. A load of sweet clover or alfalfa dirt spread over an acre just before seeding time inoculates the land. Remember a field once inoculated is always inoculated as far as we know.

Mix Alfalfa Seed With Your Timothy and Clover.

One of the best and cheapest ways to get your whole farm inoculated is to inoculate alfalfa seed with cultures that you can obtain from the alfalfa order, Madison, Wisconsin, and mix the inoculated alfalfa seed with timothy and clover seed at the rate of about two pounds of alfalfa an acre. Here is what this will do:

(1) It will gradually inoculate your entire field and make soil conditions favorable in this regard for future crops of alfalfa.

(2) It will improve the quality of your hay.

(3) It will demons[illegible] rue

value of alfalfa, especially during dry weather.

(4) It will improve the soil.

(5) It will tell you how well alfalfa will grow on your land.

(6) It does not cost much.

(7) It pays.

How to Seed Alfalfa.

The main thing in growing alfalfa is not so much the method as it is to see that your soil conditions are right. By this I mean lime, inoculation, good drainage and a fertile soil. Under these circumstances any good, common-sense method will succeed. Generally the most convenient and satisfactory method is seed the alfalfa at the rate of fifteen to twenty pounds an acre with one bushel of barley as a nurse crop. If oats are used they should be cut for hay because of their later maturity and because they dry out the soil so badly. As for the rate of seeding, will say that the better your soil is prepared the less the seed required. Where alfalfa is easy to grow fifteen pounds an acre is a great sufficiency, but for beginners twenty pounds is a safer amount. With heavy soils where washing is not apt to occur fall plowing is best. Sand lands are best plowed in the spring. Rolling any spring-plowed soil after seeding and following the roller with a light harrowing where a flat roller is used makes a firm seed bed which is very important with loose soils. Corrugated rollers break up the clods and leave a firm seed bed with a loose surface mulch. Fall plowing gives the soil time to settle and rolling is not necessary.

It is best to have alfalfa follow some well-cultivated crop like corn, tobacco or potatoes. The blue grass will cause great trouble when sod lands are used for alfalfa.

Alfalfa may be seeded alone in June if the soil is put through a careful weed-cleaning process by frequent harrowings beginning early in the spring. This is the surest way to get a stand, but also the most expensive. Alfalfa can be successfully seeded following the early harvest of such crops as canning peas or early potatoes. The land should be double disked, not plowed, and seeded before July 15th.

How to Prevent Winterkilling.

The most serious losses from winterkilling have come as a result of late fall cutting and pasturing. I was on the Cornfalfa Farms, Waukesha, the last week in September, where they have over 200 acres of alfalfa—the largest growers in the state. Peter Swartz, who is president of our alfalfa order, showed me about the fields. It was a revelation. There was a growth of from eight to fourteen inches on every one of those big fields. "How many dollars' worth of hay could you cut from these fields right now, Peter?" I asked. "Oh," he replied, "I guess it would average a ton an acre, but lets be conservative and say 100 tons on the whole farm!"

"And how much would that represent in dollars and cents?" I continued with my queries. "At least $2,000 and more than that, but I want to put it as low as possible," he replied.

"And now, Peter, the question is, are you going to leave this $2,000 worth of alfalfa go to waste? You know these are times of conservation?"

"Well, sir, Mr. Graber, we are not letting anything go to waste and yet not one spear of this alfalfa is going to be cut or pastured this fall. Two thousand dollars is lots of money, but we can't afford to take the chance of having our fields killed out by cutting the third crop after the first week in September. Why, one year we lost sixty acres just this way. Alfalfa needs all this growth to hold the snow for winter protection. No, sir, we have learned by our past mistakes, which cost us a lot of money, that unless we can get three crops of alfalfa before the first week in September it is best to leave the third crop uncut for winter protection."

Variegated Alfalfas Hardy.

But even where late fall cutting or pasturing is not practiced, winterkilling may occur in certain years when open winter weather and much alternate freezing and thawing and the formation of smothering ice sheets occur. Where these difficulties occur it pays to use the genuine Grimm, Baltic or Cossack alfalfa seed, even though it is expensive and may cost from 40 to 50 cents a pound. These varieties are hardy and will live through winters where the common alfalfa coming from seed produced in Montana, the Dakotas or Kansas may kill out. While it may be difficult to buy genuine Grimm, Baltic or Cossack, the production of these varieties, especially the Grimm, has increased so rapidly that one can obtain the seed with reasonable assurance as to its genuineness.

It is advisable for any farmer to at least try out ten or twenty pounds of the Grimm or Baltic in comparison with common Kansas or Montana-grown seed. As to the relative value of the Grimm, Baltic or Cossack, our experimental work has shown them to be about equal in their hardiness or yields. The Cossack seed, being of more recent origin, is very scarce and is now selling in the West for around $1 a pound, while Grimm and Baltic average around 40 to 45 cents.

In buying common alfalfa seed it is important to bear in mind that numerous state-wide tests in this state have shown that the ordinary Kansas and Nebraska-grown alfalfa seeds are as hardy and productive as the common produced in Montana and the Dakotas.

Annual Christmas Carcass Show.

Choice carcasses of baby beef raised and fitted by Wisconsin farm boys and girls will be the exhibit extraordinary at the annual Christmas Carcass Show to be staged again this year by the Plankington Packing Company at their plant in South Milwaukee.

Twenty-four animals will make up the consignment which will be brought to Milwaukee this week direct from the college of agriculture, where the baby beeves have been putting on extra calf fat ever since the second annual Wisconsin Baby Beef Show held there under the direction of the Wisconsin Live Stock Breeders' Association on November 15th.

H. S. Culver, general manager of the Plankington Company, who visited the state baby beef exhibit last month, and C. E. Kewley, the cattle buyer, who bought the animals for the Milwaukee concern, say they are excellent specimens of what the Badger state can do in this line of husbandry. Since the show the animals have been fed at the University Farm and have gained a total of 560 pounds, a very satisfactory gain in view of the entire change of conditions that the calves had to undergo.

One of the lot is the Angus steer fed by Walter Hartman, Lodi, which secured first prize and grand championship at the state show. The steer gained twenty-five pounds during the post-season feeding period just closed.

Two steers in the lot made decidedly large gains in weight during the time the animals have been kept at Madison. These were a Short-horn steer fitted by Leslie Doe, Beldenville, and an Angus steer fed by Howard Roser, Baraboo. The two steers each gained sixty pounds in the twenty-five-day period.

The Hartman steer at 1,055 pounds topped the list, with a Hereford steer from the hands of Will Radl, Lodi, coming second in weight, finishing at 1,015 pounds. Boys and girls whose animals will help make the Milwaukee show successful are: Martha Kelley, Wendell Kelley, Lee Jewell, Mineral Point; Kitchell Sayre, Harold Hall, Edgerton; Harry McCann, John McCann, Janesville; Clyde Taylor, River Falls; Charles Skaife, Livingston; Frances Martin, Bagley; Wayne Martin, Gotham; Leslie Doe, Beldenville; Leslie Foster, Elkhorn; H. Lintner, Arlington; Will Radl, Walter Hartman, Lodi; Howard Roser, Stanley Premo, George Premo, Baraboo; Elwyn Thompson, Lake Geneva, Florence Scott, Ted Scott, Bagley.

Law Questions.

Stallion Service Fee.

A Subscriber, Iowa.—B bred a mare to A's stallion. The mare was served once or twice. Afterwards B had a sale of stock and sold the mare, but left money in a bank to be paid to A for the service fee in case the mare was found to be with colt. Eight months after service the mare died. Can A collect the money for service fee of his stallion, or is B entitled to it?

Answer.—If A can prove that the mare was with foal he can collect the money from the bank. Otherwise B is entitled to have the money returned to him. The fact that the mare died is not important if she was with foal.

School Board Borrowing Money.

A Subscriber, Auburndale, Wis.—Where the voters of a school district in Wisconsin, vote money for the district at their annual meeting, has the schoolboard power to borrow money to pay expenses, until the money voted is paid in?

Answer.—The school board has no right to borrow money unless it is authorized to do so by the voters of the school district at their annual meeting.

Adopted Child.

A South Dakota Subscriber.—A was a widow, and had a daughter, B, who was two years old, and at that age B was adopted by C and D, who were husband and wife. D died this year leaving C with no one to care for B. B is now five years old and her mother, A, has married again. (1) Can A get the custody of B, and if so, would A have to pay for B's support for the last three years?

Answer.—It is very doubtful whether A can now obtain the custody of her daughter unless C consents to it. A might apply to the county court, and if she can prove that the child would be better cared for by her the court might give her the custody and fix the terms of it.

Unfair Dealing—Compromise.

A Subscriber, Loyal, Wis.—A rented a farm to B on the half share plan. A furnished all the cows, and each party furnished one-half the feed, and they raised calves from the cows. As soon as the calves began to give milk, B removed his share of them to his own farm, and A received no profit from them, but B continued to get half the profit from A's share of the calves on the farm he rented from A. B's lease expired two years after he removed his share of said calves from A's farm. Was B's act fair and lawful?

Answer.—B's act was not fair or lawful. By means of it he got an advantage of A to which he was not entitled. A's only remedy now is to bring suit against B for accounting and settlement, and, as this would involve the employment of a lawyer and expensive litigation, it is doubtful whether it would pay A to have such a lawsuit. It would be better if he could compromise the matter with B without going to law if possible.

Hunting License.

An Illinois Subscriber.—(1) If a boy is more than twenty-one years old, can he lawfully hunt on his father's farm in Illinois without a license? (2) If a friend wants me to come and stay on his premises and hunt game there, can I do so without obtaining a hunting license?

Answer.—(1) He must have a license, which he can obtain from the county clerk. It will cost him $1. (2) A license is required in such a case, cost $1.

Farmers who have put money into a tractor can keep up the value of their investment by giving the tractor a little attention at this time of year. Since the field work is practically all done, if the dirt and oil that has accumulated on the exposed parts are cleaned off there will be less deterioration while the machine stands idle. A coat of paint put on places where the paint has worn off will prevent rust and improve the tractor's appearance. Furthermore, the tractor should be thoroughly sheltered. These precautions are small, but they go a long way in lengthening the life of the machine and increasing its capacity for work.

Nearly ten million people subscribed $4,617,000,000 for the 4 per cent Liberty Loan which was recently floated by the government. The minimum estimate of the amount that would be subscribed was placed at $3,000,000,000.

MORE WORK FROM YOUR HORSES

Heavy spring work takes the surplus flesh from the horse. His collar no longer fits. His neck and shoulders chafe and gall. He can't do his full share of work and you lose money. Prevent these evils by using TAPATCO Pads.

A NEW AND BETTER HOOK ATTACHMENT

Consisting of wire staple, reinforced with felt washer (note where arrows point). This gives the hook a better hold and prevents pulling off. The weakest point is made strong and life of pad greatly lengthened.

Found Only on Pads Made by Us. Look For The Felt Washer.

Drain Every Swamp Acre You Own

War time profits demand that every acre be made more productive. Draining land doubles its value. But while you are at it, do a good job. Half the cost of draining is in ditching, hauling and laying the tile, and back-filling. Use the best tile you can get. It's poor economy to buy tile that shows heavy breakage in handling or that crumbles in the ground. Stopped up drains are worse than no drains. And replacing broken tile is expensive.

Use HAEGER Everlasting Drain Tile

The *standard* for *thirty* years. Strong, straight and well-burned. Once laid you needn't worry about *Haeger Tile Drain.*

GET THIS BOOK—It's called "Farm Land Drainage," and contains much of interest even for the practical farmer who is well versed in drainage methods. We have a copy for you. Just ask us for it. A postal will do.

Buy direct or through your dealer. Look for the "DIAMOND H" mark.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Wisconsin Poultry Association Show.

With three leading state breeders' clubs preparing to hold annual conventions and give cash prizes, trophies and hatching eggs as inducements to bring out favorites in their respective classes, the fourteenth annual show of the Wisconsin Poultry Association, incorporated, Madison, January 7th-10th, is expected to attract unusually excellent entries of valuable birds.

Coöperating with Sec. James G. Halpin, of the association, in staging the big poultry classes—Badgerdom's annual feathered feature event—are the members of a number of national clubs as well as the three state clubs mentioned previously. The state breed clubs who plan big doings during the show include Barred Plymouth Rock Club, W. H. Eldridge, secretary; White Plymouth Rock Club, J. J. Flad, Madison, secretary, and Buff Wyandotte Club, George M. McDonald, North La Crosse, secretary.

Entries must be made on or before January 3d, with the exception of geese, ducks and rare varieties of fowls. Uniform cooping will be furnished by the association officials. Great encouragement is to be given utility fowls this year. The show is a classified event, and males and females will not be shut together in one coop. Neither will three or four birds of any kind be confined in a coop together. Hence no exhibitor need hesitate to consign valuable poultry to the show, as the best of care will be taken of the entries, both in housing and feeding.

Farm poultry will be accorded fair treatment in the utility classes, and Mr. Halpin does not desire the idea to get out that this show is confined strictly to an exchange of courtesies among professional bird fanciers and breeders.

With present conditions demanding food products at a greater rate of output, Mr. Halpin suggests that it is time to turn away from drawing too close lines in judging fowls, and that utility and performance in the laying and hatching nests should be deemed marks of the greatest importance.

Cows which are good milkers and good mothers make the most desirable all-around type for the dairy. In the same manner, the hen that lays the eggs most consistently the year around and at the same time is not above hatching out a few of them in the interests of increasing the producing power of the family—this is the sort to make a model, Mr. Halpin says.

Breeders are coming to see this, and the ones who more nearly meet this new requirement are the ones whose stock will get the farthest, it is pointed out.

Special display pens for breeders desirous of showing their stock to prospective buyers will be provided at the show next month. Advertising will be allowed on the coops as soon as the specimen is placed on exhibition. Such birds are not in competition and hence will not be judged.

George W. Hackett, North Freedom, will judge Barred and White Rocks, White and Buff Leghorns, R. C. Reds, Brown Leghorns, White and Black Orpingtons and Black Langshans.

George Wells, Oshkosh, will settle the disputes between rival birds of the following families: Buff and Partridge Rocks, Partridge, Golden and Silver Wyandottes, S. C. Reds, White and Buff Leghorns, Buff Orpingtons, Light Brahmas.

Bronze medals will go to champions of the show in the main divisions. Individual trophy cups donated from year to year by prominent Wisconsin poultrymen will also add to the zest of the ring.

The officers of the association are M. C. Gerard, Stoughton, president; Thomas Clayton, Dodgeville, first vice president; Chas. Love, Waukesha,, second vice president; James G. Halpin. Madison, secretary; H. Durfee, Madison, treasurer; J. J. Flad, Madison, superintendent.

Winter Care of the Flock.

A little forethought now would save a lot of trouble later in the winter, when just about everything a fowl is heir to is "ripe." All goes fairly well, even the cold snaps are hardly noticed by a normal chicken, but when the first damp, dank, soggy weather comes to stay a week or ten days, why, you would better look out for trouble.

The keeper of a profitable flock was absent from home for exactly two days through this kind of weather, and on returning home was fairly panic stricken to hear the unmistakable "sniffle" that spells all kinds of trouble. Ten or twelve of the fowls were snuffling proper, and on examination their heads were found to be more or less swelled. It was one of the heavy days, stifling and uncomfortable, that causes one to hardly care whether chickens live or die. And die it seemed they might, sitting on the perches with eyes half closed.

Hoping it was as yet nothing worse than a cold, the poultryman procured a can of kerosene, dipped the head of each fowl into the liquid, and let it go at that for the night. Only that it had been done many times by this veteran poultryman, he would have hesitated about what seems to be rather strenuous medicine. Half of the ailing birds were nearly well the next morning, and another treatment pulled the others through. Fortunately, the weather cleared up, cold and snappy, and this was of great assistance.

Common colds are responsible for more ailments than would seem possible. Roup, canker, bronchitis, catarrh and all kindred diseases would rarely happen if there were no colds to cause the throat to become raw, thus giving the germs a place to begin their attack. To avoid colds, keep on the lookout for dampness and drafts. When the outside is fairly reeking with moisture it is difficult to keep the inside of the poultry quarters from dampness. By changing the litter often and providing ventilation enough to carry off all the foul air, the fowls can be kept reasonably comfortable, and it is a relief to know that this kind of weather cannot last always. This is one of the few times we recommend a reliable tonic fed sparingly. Also, a little permanganate of potash in the drinking water.

To keep the vitality up to the topnotch, however, we need an abundance of green, succulent feed. Fresh vegetables of some sort tone up the digestive organs, and then we are spared the agony of "liver trouble." Sprouted oats is considered first in the matter of green feed, but unless one is equipped for it, it is not advisable. Beets, cabbags or mangels are all good, easily stored and always ready for business. In the event that there is no cabbage to spare for the fowls, by visiting a commercial gardener it is almost always possible to procure cull heads at a small cost.

A good way is to place them, as well as freshly killed rabbits, where the chickens can reach them by leaping to get a bite. Rabbits fill the place of meat scraps, and are plentiful and may be had for the hunting.

Dry, ventilated quarters, good digestion, exercise to keep up circulation, an abundance of bulky succulent feed, and there you are. It is very simple, really, and much easier in the end than neglect. "A duty pushed aside soon returns with seven others at its back."

No Kitchen Waste for Hens

To the Editor:—There was a time, unfortunately, when the story, "Kitchen Waste for Hens," would have had a hearing. Today it is not modern. The time when a woman would set a pan on the kitchen table while she cleared the cupboard preparatory to placing clean papers on the shelves, filling said bucket in the meantime with bread scraps, cold biscuits, corn bread, a few potatoes, meat rinds, possibly stale cookies and other things "too numerous to mention" is no more.

There is a better reason today for not putting pieces of meat in the waste so large that a hen cannot swallow them. As a matter of fact, no fats of any kind are being dumped into the scrap heap for chickens or anything else. Fortunate is the dog that is not going hungry these days, though in mercy's name do not let the stock of any kind suffer.

The odds and ends of vegetables are being all placed in one deep dish and set aside to make soup; a good, nourishing dish is possible, too, where there is an abundance of milk. The parings can be given to the hens, but unless there is a goodly lot of green stuff better feed them raw.

If a mash is desired, all right, but please count on using bran and shorts and oats, anything, everything that is meant for animals, but not "large pieces of fat" that would help to allay the hunger of the world. No table has any business to leave rich scraps of pie and cake and bread and meat; few are the people these days that are serving pastry unless in very limited quantities. We saw a kid the other day who several years ago turned up his nose at two very choice kinds of pie, eagerly devour—devour is the word—a wedge of dried fruit pastry.

This may be a little out of place, but we are chicken cranks and think the hens should have everything coming to them—and ours get it. In return we are serving eggs every morning for breakfast and dividing up with our friends for pumpkin pies.

Patriotic Farm Woman.

George M. Rommel, of the federal department of agriculture, states that there are about 800,000,000 bushels more of grain in the country this year than there was a year ago. Much of this grain should be fed to live stock, since it would cause a considerable slump in prices if thrown onto the market.

THE LOWEST Priced Incubator Per Chick Hatched
This is proved by the "Successful" 26 year record. You want the "Successful" for a sure success this year. Sell more eggs and chickens—help feed the world.
"SUCCESSFUL" INCUBATOR or BROODER

Certified Growers Incorporate.

To the Editor:—At the State Potato Convention held in Madison, November 19th-24th, a number of certified seed growers formed themselves into an association and incorporated under Chapter 86 of the Wisconsin statutes.

The purpose of this organization is to standardize the certified seed potatoes so that only a very high quality of seed potatoes will be offered for sale as certified seed and to arrange for the selling of this seed through an agency controlled by the association. This organization adopted the name, Wisconsin Certified Seed Potato Association.

The first regular meeting was held in Grand Rapids, Wisconsin, December 7th. A large number of growers were present and all showed a lively interest in the discussions, which were very helpful in forming the by-laws of the association and in establishing a standard grade for certified seed potatoes. It is the general opinion of all the growers that we must put more "quality" in the seed stock for sale and to set the standard high and keep it there. Any member who fails to use careful and proper methods in the growing, sorting, grading and shipping of certified seed potatoes may be expelled from the association. What we want to do is to let the country know that Wisconsin certified seed growers have certified seed potatoes for sale that are bred right, cared for in the field properly, sorted and graded to a standard, second to none in the United States.

We have fifty-five charter members and expect all the certified seed growers to join the association within a few days.

The following are the directors elected at Grand Rapids:

O. C. Woodard, of Weyauwega, term of one year.

Wm. Scribner, of Bancroft, term of two years.

Karl T. Hazelberg, term of three years.

The officers are: President, O. C. Woodard; vice president, Wm. Scribner; secretary-treasurer, Karl T. Hazelberg. Mr. J. W. Hick was appointed adviser to the board of directors.

Karl T. Hazelberg.

Barron Co., Wisconsin.

Cow-Testing Reports.

Probable Shortage of Young Bulls.

To the Editor:—During the month ending December 13th, 1917, 539 cows were tested, of which twenty-three produced forty or more pounds of butterfat. Fred C. Marty's registered Holstein, Mercedes Echo Johanna, heads the list with 1,317 pounds of milk and 64.7 pounds of butter fat. The best grade cow is a Brown Swiss owned by J. M. Freitag. In thirty days she produced 1,191 pounds of milk and 50 pounds butter fat. Grain is not being fed very extensively on account of the prohibitive prices on all mill feeds. Where possible, almost all of the dairymen in this section are feeding all the roughages possible, although some have been forced to buy grain on account of being short on good roughages. Pure-bred breeders are marketing all their male calves, claiming that there is little or no profit in raising them when comparing feed prices and the prices of breeding stock. A shortage in young bulls is likely to be the result.

G. A. DEEDON, Official Tester, Reedsburg Cow-Testing Association.

Oats and Bran Fed Chiefly.

To the Editor:—During October 333 cows were tested in the New Holstein Cow-Testing Association, Calumet county. Concentrates are not fed as much as last winter, owing to the high prices of same, oats and bran, being fed the most, although a few are feeding gluten or linseed meal. Oats are 75 cents per bushel; bran, $42; gluten, $55, and oil meal $56 per ton. H. J. Duecker's herd of registered and grade Guernseys carried off the honors for the third consecutive month. This herd averaged 431.5 pounds of fat for the previous cow-testing association year. During October the average of this herd was 33.9 pounds fat and 643 pounds milk. A grade Guernsey in the same herd made 118.95 pounds milk and 52.3 pounds fat in the same month. The condensery paid 71¼ cents per pound for fat and the cheese factories from 63 to 67 cents. The forty-five pound list for October follows:

Owner, name and breed.	Age.	When fresh.	Lbs. milk.	P.C. fat.	Lbs. b'fat.
H. J. Duecker					
Redback, G. G.	8	7-1-17	1189.5	4.4	52.3
Vivian, R. G.	3	7-24-17	829.3	5.8	48.1

NANDER NELSON, Official Tester.

Good Records in Walworth County

To the Editor:—A number of splendid records were made in the W. E. Palmer and A. G. Palmer & Son herds during the thirty-day period ending November 30, 1917. W. E. Palmer's four-year-old Holstein, Fall Breeze Veeman Lady, produced 2,589 pounds of 4.5 per cent milk or 116.5 pounds butter fat. A. G. Palmer & Son's Holstein cow, ten-year-old Fall Breeze Beauty 2d, produced 2,640 pounds of 3.6 per cent milk or a total of ninety-five pounds butter fat. A. G. Palmer & Son's two-year-old heifer, Sadie Mercedes, produced 1,578 pounds of 3.1 per cent milk, making a total of 48.9 pounds butter fat. The following is the list of forty-five-pound cows in the Geneva Coöperative Cow-Testing Association for the month ending November 30th:

Owner, name and breed.	Age.	When fresh.	Lbs. milk.	P.C. fat.	Lbs. b'fat.
D. E. Davis					
Nell	.	10-2-17	1404	3.3	46.3

NORRIS I. NELSON, Official Tester.

In Wood County.

To the Editor:—The high cow in our association for November was pure-bred Holstein Piebe, owned by E. E. Royce. She produced 1,203 pounds of milk testing 5 per cent and netting 60.15 pounds of butter fat. The high herd was owned by Thomas Thompson and is also pure-bred Holsteins. Six cows had an average test of 4.02 per cent and an average butter fat production of 31.89 pounds. Our association has bought two carloads of feed, one of corn and one of gluten. Four systems of drinking cups have been installed by members of our association, and four barns have been whitewashed.

J. B. Davis.

Official Tester, Wood County Association No. 1.

News of the Sale Ring.

International Hereford Sale.

The sale of Herefords at Chicago Friday of the International week under the management of the American Hereford Breeders' Association set a new mark in Hereford sale annals. Two bulls not originally listed for the sale were included in the offering, and one of them, the grand champion Ardmore, considered by many competent judges

(Concluded on page 21.)

VETERINARY INQUIRIES ANSWERED.

THERE never was a time in the past when it was so important to keep farm animals in good healthy condition as it is at present. To this end The Wisconsin Farmer will give free advice to all its readers through the columns of this paper. If you are having trouble of any kind with your live stock and will send The Wisconsin Farmer a detailed statement of the case you will be given expert advice and this will be forthcoming promptly. It is even more important to keep live stock in a healthy condition than it is to doctor them after they get sick and it frequently happens that our veterinary editor can give pointers that will tend to ward off trouble when his instructions are followed. As said before, this service is free and the more of our readers who avail themselves of it the better satisfied the editors and publisher of The Wisconsin Farmer will be.

Lansing Vitrified Tile Silo

Build your silo to last as long as you live to run your farm. Durable tile—first cost only cost. "Ship-lap" blocks—stronger walls. Less mortar exposed—silage settles and keeps better. Twisted steel reinforcing—steel hip roof—steel chute. Write for catalog.

J. M. Preston Company
Dept 333 Lansing, Mich.
Also Climax Silo Fillers and Bidwell Threshers

THIS department is to bring the buyer and the seller together. You may have live stock, poultry and eggs or machinery for sale. You may want to sell or buy a farm. Write your copy for the advertisement. The rate is six cents per word, each insertion.

The Wisconsin Farmer, Madison, Wis.

FARM LANDS.

GO WHERE LAND IS LOW PRICED—Last year we urged some of our investor friends to purchase certain farm lands in Eastern Oklahoma which were then offered at from $35.00 to $50.00 per acre. Many of these farms in 1917 earned for their owners several times the cost per acre in 1916. We still have a few farms listed for sale at very attractive prices. They are worthy of the consideration of any man who wants to buy a farm. We do not own these lands but with a view to increasing the number of farmers along our railroad, and thereby building up our trade territory, we have interested ourselves in the matter of distributing information in territory where we know there are good farmers, hoping that we can move some of them into eastern Oklahoma. We do not charge anything for our services. We will be well repaid if our territory is built up by the removal thereto of a number of men who know how to farm. If you are interested in a farm in eastern Oklahoma, of the kind referred to above, write me for particulars. R. W. Hockaday, Industrial Commissioner, M. K. & T. Ry., 1505 Railway Exchange Bldg., St. Louis, Mo.

LANDOLOGY, a magazine giving the facts in regard to the land situation. Three months' subscription FREE. If for a home or as an investment you are thinking of buying good farm lands, simply write me a letter and say, "Mail me LANDOLOGY and all particulars FREE." Address Editor, Landology, Skidmore Land Co., 310 Skidmore Bldg., Marinette, Wis.

80 ACRES, 4 cows, 2 horses, new wagon, mower and hay rake, harness, buggy, chickens, furniture, good buildings and well. Pierce county, Wis. All for $3,800. Herbert, R. 2, Box 15, Red Wing, Minn.

WOULD YOU SELL YOUR FARM if you got your price? Sell direct. No commissions. Particulars free. Charles Renich, G-2, Woodstock, Illinois.

WILL TRADE farm in Polk county, Ark., for Wisconsin or Illinois land. L. Temmey, 509 Brownell, Lincoln, Neb.

TWO FARMS FOR SALE—Near town, school, etc. Will rent one to right party. H. V. Peoples, Ladysmith, Wis.

WANTED—To hear from owner of farm or unimproved land for sale. O. K. Hawley, Baldwin, Wis.

FARMS FOR SALE—Address Reuben M. Ellerd, Box 6, Plainview, Texas, owner.

LETTERS intended for publication should be accompanied by the name and address of the writer not necessarily for publication, but as a matter of good faith. All communications intended for this department should be addressed to Editor Home Dept., The Wisconsin Farmer, Madison, Wisconsin.

Two Christmas Dinner Menus.

Cream of Celery Soup
Celery Tips
Roast Turkey with Oyster Dressing
Cranberry Sauce
Candied Sweet Potatoes Stewed Corn
Relish
Mince Pie Coffee

Cream of Celery Soup.—Take the coarse outer stalks of the celery, clean and cut into half-inch lengths; put into a saucepan, cover with boiling water and boil until tender. Do not cover the pan. Drain, and save the water. Mash the celery through a colander, return to the water and boil for ten minutes; then strain into a double boiler. To each cup of the celery water add a cup of hot milk. Season to taste with salt and pepper, and for each pint of the liquid add one teaspoon butter and one teaspoon flour rubbed together. Boil for five minutes. Serve with a little dried or freshly chopped parsley on top.

Candied Sweet Potatoes.—Ten sweet potatoes, two tablespoons shortening, two tablespoons sugar, salt and pepper to taste. Cook the potatoes in the usual way. Put the shortening and the sugar into an iron or other heavy pan; set over a slow fire; when melted, add the sweet potatoes and fry very slowly. The shortening and sugar will stick to the potatoes very quickly, so care must be taken not to burn them. Sprinkle with salt and pepper and serve on a hot dish.

Tomato Soup
Baked Ham with Hominy
Baked Apples Creamed Carrots
Spiced Peaches
Steamed Fruit Pudding Coffee

Baked Ham.—A small smoked ham, half a ham or a slice cut three inches or three and a half inches thick from the center of the ham, should be used. Wipe, put on the fire with enough cold water to cover; boil slowly until tender. Boil the day before, and let it cool in the stock. Trim off the skin; place in a shallow pan; cover with half a cup brown sugar, one tablespoon flour and an eighth of a teaspoon pepper; add two cups cold water, and bake until nicely browned. Baste two or three times. Add two cups of cider and two tablespoons flour, mixed with a little cold water; boil for five minutes, add two tablespoons caramel, to make the gravy nice and brown, add salt if needed. Place the ham in the center of a plate and put a border of hominy around it. Pour part of the gravy over the ham and hominy. Garnish the platter with holly leaves.

Steamed Fruit Pudding.—Two cups dried peaches, apples, plums or apricots, two cups flour, one cup milk, two tablespoons melted shortening, one tablespoon baking powder, one-half teaspoon cinnamon, one-half teaspoon nutmeg, two eggs. Wash and soak the fruit overnight; drain. If in large halves or quarters, cut into small pieces; add to the dough, which is made as follows: Sift the flour, baking powder and salt into a bowl; add the milk, well-beaten eggs, shortening and spices; mix well; add the fruit; put into a well-greased mold or kettle. Place in a saucepan of boiling water and steam for two hours. Serve in a shallow bowl with a fruit sauce made from two cups of fruit juice. Bring the juice to a boil; add enough cornstarch to thicken and sugar to taste. Serve both pudding and sauce while hot.

Meats Easily Canned.

The canning season for fruits and vegetables is over, but when butchering time comes the thrifty housewife will have occasion to put her hot water bath or steam pressure cooker into operation again.

Meats can be just as easily and just as successfully canned as vegetables if the same rules are followed. Cleanliness is the first essential. Next in importance is attention to the details of processing or cooking. If the hot water bath method is used the heat must be intense enough to boil the water rapidly and the time should not be counted until the water around the jars boils.

The jars, lids and rubbers should be washed and sterilized with boiling water and the meat should be packed into the hot jars until it reaches the top. If screw-type lids are used they should be made as tight as possible with thumb and little finger before placing the jars in the cooking vessel. If the bail-type jar is used the top bail should be left loose until the jar is taken from the hot water bath. Only first-class rubbers should be used. Good rubbers can be stretched and will return to their natural size. Lids should be tightened as soon as the jars are taken from the hot water bath or steam canner.

If there is not enough meat to fill the jar it is not necessary to do so with water. Usually about a tablespoonful of boiling water, or just enough to create moisture in the jar, will be sufficient. If the meat has been browned before canning and the jar is not filled, the liquid or grease in which the meat has been heated should be poured over it, as there is no danger of getting too much of this and it will make good gravy when the can is opened. All these points—although some of them seem unimportant—have a direct bearing on the success of the canning work and none of them should be overlooked.

In canning beef or hog liver, cut in slices one-third inch thick. Blanch or parboil one minute in boiling water, remove and pack in jars. Add one teaspoonful of salt to each quart. Fill jar with boiling water. This should require only a small amount, as the meat should be packed closely. Some of the water should reach the bottom of the jar and this can be accomplished by pressing the meat away from the sides of the jar with a fork or knife to allow the water to pass. If using the hot water bath outfit, process three hours for pints and three and one-half hours for quarts. If steam canner is used, process in ten to fifteen pounds of steam seventy-five minutes for quarts and sixty minutes for pints.

Champion Agricultural Club.

The Glenwood Mother-Daughter Canning Club, of Leavenworth county, Kansas, has been adjudged the champion agricultural club in thirty-three northern and western states, according to word just received from O. H. Benson, in charge of boys' and girls' work, states relations service, United States Department of Agriculture. The club already had the distinction of ranking first among mother-daughter organizations.

This honor was the result of the work done in 1916 when with twenty-nine teams approximately 11,000 quarts of fruits, vegetables and meats were canned. No team canned fewer than twenty-one varieties and one team put up 253 kinds of products. This year the club has thirty-seven teams, and it is expected that the final report on the work will show an increase over the number of cans filled last year. One mother and daughter have canned 1,023 quarts.

The Glenwood Club was the first mother-daughter canning club in the United States. It was organized in 1915 by P. H. Ross, then county agricultural agent of Leavenworth county, and Otis E. Hall, state club leader, and was composed of eleven teams and twenty-two members. These teams canned 2,900 quarts of products.

In the Glenwood community is a small frame church which stands in the open country four miles from a town, and schoolhouse a mile distant from the church. The Glenwood Club has made itself responsible for the renovation and repair of the church, for the improvement of the church and school yards and for better paid teachers. The county farm bureau has been strengthened, a community club which includes all members of the families represented in the Glenwood Club has been organized, and the whole neighborhood has been united for work and for pleasure through the members of this canning club. Members of the club are preparing and serving free of charge hot lunches for the school children. The school board provided the equipment.

Breakfast Menus.

To the Editor:—I always read the Home department with interest and I noticed an inquiry from one of the readers for breakfast menus. Now I consider one of the best dishes for breakfast is fried mush. For mush to really taste good don't cook it as thick as is generally done. Of course, it is easier handled that way, but not nearly so appetizing. We can make a very satisfactory meal on bread and mush with coffee and oatmeal to finish with. Corn flakes make a nice change. When we butcher we use scrap, liver and the head for pudding by boiling all until tender, then grinding and cooking out the water so it will keep. I reheat a portion for breakfast, using a little water or roasting in the oven. This pudding, with mush, is about the best breakfast we can get.

My husband likes biscuits, so I often make a batch of biscuits for breakfast with nothing more than butter, brown sugar sirup and coffee, or sometimes oatmeal.

Another good breakfast (and a cheap one) is simply pancakes with sirup and coffee. I use only one egg for making the pancakes. Beat the batter well and they will be light. Buckwheat cakes can be had in place of wheat cakes. Mrs. M. A. Whisler.

Household Helps.

Salt sprinkled on a range will absorb all grease splutterings.

A novel idea is to line dresser drawers with paper like that on the walls of the sleeping rooms. Fasten the paper down with thumb tacks.

When sprinkling clothes use hot water. It dampens them more evenly than cold.

Do not throw away the tops of celery. Wash them well, dry thoroughly in the oven and keep in a tightly closed jar to be used as a flavoring for soups and stews.

Paint the lowest step of the cellar stairs white if the cellar is dark. This

plan may save a fall and will do away with feeling for the last step when going down stairs.

Stockings may be cut open after the feet are removed, and be converted into warm tights for small children.

Immediately after ironing stiff shirt-cuffs, bring them together exactly as they will be when the links are in, and fasten with a spring clothespin. They will harden in just the right curve without wrinkles.

Instead of throwing a dirty chamois leather away put it into a weak solution of soda into which you have thrown some grated soap. Leave it for two hours and then rub until clean. Finally rinse the leather in warm, soapy water. Never put it in pure water, as it will grow hard in drying. When it is washed wring the leather in a linen cloth and dry quickly. It can also be rubbed dry and brushed until soft.

THE YOUNG FOLKS.

School Has Community Fair.

Dear Young Folks:—I live on an eighty-acre farm. It is nine miles to town and two and a half miles to school. I am a little girl eight years old. I have a little brother four years old. His name is Wilson.

I started to go to school last year. I went until the snow came too deep and it was too cold, then I brought my books home and studied at home all through the winter and passed my grade. I am in the third grade this year.

We had a community fair in our school last month. It was the first fair ever held at our school. I took first prize on a pine needle basket that I made at school. The prize was a nice book. We had a lunch and a good time.

Margaret.

A Surprise Party.

Dear Young Folks:—I want to join your circle if I may. I always read the Young Folks' page and am always delighted with the letters. I am a little ten year old. We live in the country two miles from town. We do not live on a farm. We live in the depot. My father is a section foreman and my brother works in the depot nights. I have two brothers, but no sisters. We go to country school one mile away from home.

I am going to tell you about a party we had. One of our neighbors had a son who had to go to the training camp to be a soldier and the night before he left we had a surprise party on him. He didn't know anything about it. We all chipped in to buy him a present. We had ice cream, cake and other things to eat. Everyone enjoyed the party. We went home about one o'clock and we were all pretty sleepy. We danced and played many games.

I hope all the Young Folks will enjoy reading my letter. Marie.

A Pet Jack Rabbit.

Dear Young Folks:—I am a boy twelve years old. My birthday was the ninth of December. I wrote to the Young Folks once before, but my letter was not in the paper.

One night when we were coming home from church we saw a rabbit and stopped and got out to get it. It was hurt and we took it home. It got better and would eat corn and grass, and drink lots of water. We kept it in a box and one night it got out and the dogs killed it. Ray.

Wants a Watch for Christmas.

Dear Young Folks:—I have written to your page before, but my letter was not in the paper. I guess there were so many others writing there was not room for it. But I am going to look for it in this time.

I am a boy ten years old and am in the fifth grade at school. I like my teacher very much. We live six blocks from school.

What do you want for Christmas? I want a wrist watch and an overcoat. I think that is all I want. W. G. S.

International Sunday School Lesson.

Lesson for December 23, 1917.

The Story of the First Christmas.

LESSON TEXT—Matthew 2:1-12.

GOLDEN TEXT—There is born to you this day in the city of David, a Savior, who is Christ the Lord.—Luke 2:11.

The story of the birth of Jesus is recorded in three of the four Gospels, Matthew, Luke and John, each of which contributes some feature essential to complete the picture. No one should teach this lesson who does not have a good "harmony of the Gospels." Every year for the forty-five years of the International Sunday School Lessons, we have had the Christmas lesson taken from these three Gospels one at a time. This year in closing the present series, we unite all three Gospels in one complete story, "The Story of the First Christmas."

The order of events should clearly be kept in mind as follows: The angelic announcement to Zacharias, the priest, while in the exercise of his ministerial office. The angelic announcement to Mary, the mother of Jesus, and to Joseph, her espoused husband. Mary's visit to her cousin, Elizabeth, and the birth of John the Baptist. The birth of Jesus and his circumcision on the eighth day (Luke 2:21). His redemption some thirty-one days later, introducing Simon the priest (Luke 2:22), and the purification of the mother.

The coming of Jesus was at the most opportune time in all the history of the world, for Palestine was the central region of the Roman empire. The whole civilized world was subject to Roman domination. He was born while the entire world was at peace, for once in its history. Travel was at its best, for the Roman military roads all centered in Rome and extended throughout the empire. The Greek language was spoken everywhere, along with native languages, so that the Gospel could readily be heard in all parts of the empire. The Old Testament was translated into Greek. The Jews were scattered throughout all lands, carrying this Old Testament with them, and had established their synagogues in nearly every city and town. There was also a widespread intellectual and moral awakening, and there was widespread religious unrest and a hungering for something better.

I. The Search. Notice that he who was born on this first Christmas was the "only begotten of God." This divine being became flesh, a strange and seemingly impossible union, but only such a union of the human and divine could draw man to God. If Jesus had not been identified with the divine nature of God, all the love, honor and devotion which we give to him, would lead us into idolatry. (1) Wisdom seeking (vv. 1, 2). See also Act 13:6. Who these men were, we do not know. They were evidently students of the stars, and perhaps came from Persia whither Balaam went. (Numbers 23:7; Numbers 24:17-19.) They may have known of Daniel's prophecy. They came because they had seen a star. A little light, only a small star, and we may have the sun. (John 8:12.) The highest wisdom is to know God. (Prov. 9:10.) We do not have to seek far to find him. The highest wisdom is also teachable. "Where is he that is born?" These wise men were not the first ones to seek him, for the humble shepherds who had heard the angelic host (Luke 2:15, 16), immediately went to Jerusalem to make sure that the good news was true. Tradition only gives us the names of these men. They typify the world, the first Gentiles who came to seek Jesus. (2) Wickedness Seeking (v. 3-8). It is interesting to note the alarm of Herod, his suspicion and jealousy. Why? Note the carefulness of Herod's search. First the chief priests, who were theologians; then the scribes and lawyers, who were the historians; then the common people who were familiar with the traditions; and, finally, the wise men (v. 7).

II. Wisdom Rewarded (vv. 9-11). Persistent obedient searching after God always brings wisdom. Notice the steps of the wise men. They sought, they found, they rejoiced, they

worshiped and they gave gifts. The stable of Christ's birth is evidently an exchange for a house (v. 11 and Luke 2:7). The gifts they presented have a threefold significance: Gold, for royalty, indicating divine glory; Frankincense for deity, the aroma of his life; Myrrh, signifying death, his death and its value to mankind. Notice that they did not worship Mary.

III. Wickedness Foiled (vv. 12-16). God intervened (v. 12). Notice the impotent rage of the enemy (v. 16). Christ was delivered, Herod was dismayed, and the people were desolate.

Suggestions: The cry "where" of the human heart is here answered. God answers all honest searching. God himself gave his best gift (John 3:16). God also desires our best gift. We must worship Jesus as king. Religion is not for the Magi alone, nor for the common people; it is for all. We have not far to go to seek the Christ. He is even more than near, "For behold I stand at the door and knock."

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Enclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date fall and winter 1917-1918 catalog, containing 550 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating thirty of the various simple stitches), all valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

1885—Ladies' combination of corset cover and drawers. The pattern is cut in 7 sizes: 32, 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 3⅝ yards of 36-inch material for a medium size. Price 10 cents.

1963—A new and pleasing apron model. The pattern is cut in 4 sizes: 34, 38, 42 and 46 inch bust measure. Size 38 requires 5½ yards of 36-inch material. Price 10 cents.

1982—Middy blouse for small women and misses. The pattern is cut in 3 sizes: 16, 18 and 20 years. It requires 3¼ yards of 36-inch material for an 18-year size. Price 10 cents.

2004—Junior dress, with sleeve in either of two lengths. The pattern is cut in 3 sizes, 12, 14 and 16 years. It requires 5¼ yards of 36-inch material for a 14-year size. Price 10 cents.

2067—Ladies' one-piece dress with sleeve in either of two lengths. The pattern is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires for a 36-inch size, 6 yards of 44-inch material. Price 10 cents.

2104—A charming lounging robe. The pattern is cut in 4 size: Small, 32 and 34 inches bust measure, medium, 36 and 38 inches bust measure, large, 40 and 42 inches bust measure; extra large, 44 and 46 inches bust measure. Size medium requires 6¼ yards of 44-inch material. Price 10 cents.

2170—An ideal house dress. The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires for a 38-inch size, 6⅞ yards of 36-inch material. Price 10 cents.

2292—An attractive top garment. The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 requires 5½ yards of 44-inch material. Price 10 cents.

2301—A practical, serviceable model. The pattern is cut in 5 sizes: 4, 6, 8, 10 and 12 years. Size 10 requires 1⅝ yards for the waist and 2½ yards for the drawers, of 27-inch material. Price 10 cents.

2306—An up-to-date dress for the growing girl. The pattern is cut in 4 sizes: 8, 10, 12 and 14 years. Size 12 requires 6 yards of 36-inch material. Price 10 cents.

Waist 2308-Skirt 2291—A smart combination. The waist pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It will require 3 yards of 36-inch material for a medium size. The skirt is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. Size 24 requires 3 yards of 44-inch material. Two separate patterns, 10 cents for each pattern.

2310—A smart dress for mother's girl. The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 requires 3¾ yards of 44-inch material. Price 10 cents.

Our Best Offer

Today's Housewife Two Years---24 Big 10-Cent Numbers For Only a Dollar Bill

This phenomenal bargain must be accepted by you within the next twenty days because the cost of magazine-making is going up by the minute. Paper and ink alone cost us $150,000.00 more than last year.

Now that Congress has passed the Zone Postage Bill, which will add millions of dollars to the expenses of the various magazines, it is certain that very few magazines can continue to be published at present low prices. Most magazines will soon cost 20c per copy.

Every coming number of TODAY'S HOUSEWIFE will be so brimful of tested recipes and household pointers of such priceless value that you will get many times your money's worth, without even considering the many refreshing short stories, great serials and our new, superior Crochet and Fancy Work pages.

Never did any magazine fill a big need as TODAY'S HOUSEWIFE is filling it today in over a million homes. The lessons in Domestic Science now appearing in TODAY'S HOUSEWIFE are of incalculable value—their worth cannot be measured in dollars and cents to the woman whose heart and soul are wrapped up in the welfare and happiness of her family.

If you are that type of woman we urge you to send $1.00 today for a two-year subscription before it is too late. Remember this offer and the wonderful one-year club offers below are only guaranteed to last 20 days more.

Subscribe today and thus make sure the 20 days will not pass by, taking with them our special offer.

Today's Housewife Decreases the cost and Increases the joys of living.

TODAY'S HOUSEWIFE is the new title of TODAY'S MAGAZINE, with which has been consolidated The Housewife. This attractively illustrated housekeeper's magazine is bigger, brighter and better than either was alone. Every issue will afford your entire family many hours of pleasure and in addition the inspiration and encouragement that always make both present and future brighter.

Dairymen Not Profiteers.

No class of producers are operating on a smaller margin of profit at this time than are men engaged in the dairy business. The selling price of dairy products has not kept pace with the increasing cost of feed and labor. Thus while men in some lines have boosted prices and have made immense fortunes, almost overnight, dairymen have seen their profits grow less and less.

Profiteers have taken advantage of war conditions to increase their personal wealth. Dairymen have done nothing of this sort. At no time have they asked for more than a legitimate profit and at no time have they attempted to secure more than that. In fact, many dairymen are trying to pull through the war-time period without utter financial ruin. They hope then for an opportunity to produce at a lower cost and by that means hold to the business of their lifetime.

There is a strong element of patriotism in the way the dairymen are sticking to their job. Milk is badly needed. Probably there is a stronger requirement for milk at this time than ever before. In every war men have distinguished themselves by staying with their ships until they were engulfed in the depths of the sea. Dairymen as a class are more nearly to be compared to those heroic seamen than are any other class of producers. On the average farm where a few cows are kept and other lines of farm and live stock work are carried on there is a strong temptation to curtail the production of milk. This is to be expected on account of possible greater returns from some other lines at this particular time. However, true dairymen realize the need for a plentiful production and are endeavoring to keep up a sufficient supply.

So long as dairymen are given a reasonable opportunity they will prevent milk from becoming so scarce as it is in some European countries where it is reported that babies are starving for the want of milk. Our American dairymen are far too patriotic to produce this wilfully. The public is too patriotic to permit prices to be kept down to such a level that it will be forced upon the dairymen to cease production.

No line of dairying or branch of work pertaining to dairying is booming. In this is full evidence of a lack of profiteering. Dairymen are working hard to make both ends meet. They are happy if they can show even a small balance at the end of the year. They are furnishing probably more food nutrients in return for the raw products than are those engaged in any other line of production. Instead of this being profiteering it is patriotism intensified. Dairymen are doing their share to win the war. They are doing it with a spirit and determination that deserves the praise of everyone who is interested in the welfare of our nation and who desires to see the war brought to a successful conclusion.

The future looks serious, but not forbidding. Price of farm feeds is being regulated to some extent directly or indirectly. The established price on wheat has practically fixed a corresponding price on bran and this has had an effect upon the cost of other feeds. The ratio of price on hogs to corn and the minimum established on hogs is having a stabilizing effect upon corn products. Well-informed dairymen are not worrying about the price of grain going enormously high. With some labor available and by the use of machinery wherever possible they will hold out so long as the war shall continue.

Advances in price which have been made upon dairy products have been forced by the increased cost of production. Those increases have caused resentment in some quarters. Yet any fairminded man is able to see that the cost of production has nearly doubled. There has been no profiteering in this. It has been absolute necessity. People have been thinking the matter over and now realize that the advance has been merited. Now people have come to realize that dairymen, while they are not, strictly speaking, martyrs, are giving a full measure of patriotism as well as a full measure of milk in these turbulent times.

The Dairy Cow Not Always to Blame.

To the Editor:—When the returns from the dairy business are not satisfactory it is not at all unusual for the owner to complain that his cows are poor, and for his friends to advise him to obtain better cows. The explanation is very plausible and the remedy is easy to suggest. But it is often found that the explanation is incorrect and the remedy is impracticable.

It is easier to blame the cows than it is to carefully investigate the real cause of their shortcomings, and it is often pleasanter to do this than it is to admit that the owner may be more deserving of blame than are his cows.

But easy and pleasant ways are not always the right ones. They sometimes lead those who follow them far astray. Comparatively few cows have ever reached the limit of their possible productiveness. The great majority have an actual and a potential accomplishment—what they do and what they have the capacity of doing. The quality of milk which they yield is below what might and ought to be. If judged by their present productiveness they must be ranked as poor cows. But if possible yield is made the basis of judgment many of them go into a higher class.

It is perfectly natural that the owner of a cow that never yields more than a moderate quantity of milk should be dissatisfied. But in a great many, probably in the majority of cases, much can be said of the cow. She has never been placed under conditions which would enable her capacity for milk production to be determined. No intelligent and persistent effort to find whether she can do better than she has done has ever been made. It is true that she may not be valuable, but it is not fair to the cow or profitable to her owner to condemn her as inferior until she has had a fair and adequate trial. She should not be put in the class of poor cows until well-directed efforts for her improvement have been made.

Whenever conditions are at fault they ought to be corrected and the cow then be given a fair period of probation. If this is done it is not at all improbable that a good part of the blame for the shortcomings of which he has complained should be placed on the owner rather than on the cow.

There are various ways in which conditions may fall below a proper standard. There are farms on which the cows require better protection against sudden changes of temperature, from extremes of heat and cold, and from exposure to storms. All causes of discomfort should be removed as fully as possible. It is useless to expect that a cow will do her best if she is not satisfied and contented.

On many farms the principal efforts for improving the conditions and thus increasing the productiveness of the cows should be directed toward the feeding. Changes along this line may be made with great advantage. They may involve the giving of larger quantities of food, or the use of more expensive materials in the ration. Or they may require the use of the same materials in different proportions, or some changes of foodstuffs which will not increase the cost of keeping.

On some farms where the convenience of the owners is regarded as of greater importance than the welfare of the cows, greater regularity in the times of feeding would be of marked benefit. The water supply, too, is sometimes at fault, especially in cold weather. Where this is deficient or the quality poor the yield of milk will be only moderate and the character of what is produced will probably be bad. In cases like these all adverse criticism should be withheld from the cows and bestowed upon the owners.

The only real profitable course to take when the dairy does not yield a fair profit is to find out whether the cows are inherently, and consequently hopelessly, inferior, or whether their low rate of production is due to the conditions under which they are kept and the ration they are receiving. If conditions are made right and the cows still fail to be productive, it is evident that they are lacking in capacity, and the sooner they are made ready for the butcher the better. But be sure first. R. B. R.

Sheep at the International Show.

Good Exhibits in All Classes---Wisconsin Figures High in Both Breeding and Fat Classes.

A LIVELY interest was taken in the sheep department of the International Live Stock Exposition this year. Exhibits were sufficiently numerous to make this department an important feature of the exposition and the work of judging never has been watched with greater zeal than was the case this year. Wisconsin University made some creditable entries and it was to be expected that Shepherd Kleinheinz should land some of the best ribbons. He took the championship in the fat Shropshires and the same premium in the fat Rambouillets, but was defeated in the Southdowns by Jesse C. Andrews, of West Point, Ind., who also carried away the grand championship prize. A number of Wisconsin breeders took an important part as exhibitors and a close study of the awards which follow will show that some of the best prizes went to Wisconsin flocks. The following is a list of the prize winners in the breeding classes:

Shropshires.—Exhibitors Jesse C. Andrew, West Point, Ind.; James Brown, Dundee, Ill.; A. Broughton & Sons, Albany, Wis.; H. D. Eddingfield, Mt. Pleasant, Ia.; J. Lloyd Jones, Burford, Ont.; A. J. Knollin, Pocatello, Idaho; Ralph A. Postle, Camp Chase, Ohio; University of Illinois, Urbana, Ill.; Henry L. Wardwell, Springfield Center, N. Y. Judge, Wm. Renk, Sun Prairie, Wis.

Ewe lamb under 1 year (12 shown), 1st Broughton & Sons, 2d Wardwell, 3d Andrews, 4th Knollin, 5th Wardwell, 6th Knollin.

Champion ram, Broughton & Sons on yearling; champion ewe, Broughton & Sons on yearling; flock (5 shown), 1st Broughton & Sons, 2d Andrews, 3d Wardwell, 4th Knollin, 5th Eddingfield; 4 lambs, either sex (5 shown), 1st Wardwell, 2d Broughton & Sons, 3d University of Illinois, 4th Knollin, 5th Andrews; pen of 3 yearling ewes (4 shown), 1st Broughton & Sons, 2d Andrews, 3d Eddingfield, 4th Wardwell; pen of 3 ram lambs (5 shown), 1st Broughton & Sons, 2d Wardwell, 3d Knollin, 4th Andrews; pen of 3 yearling rams (4 shown), 1st Broughton & Sons, 2d Wardwell.

Pettifer Challenge Cup, given by Stephen Pettifer & Sons of Malmsbury, England—Won by Henry L. Wardwell for the best pen of 4 Shropshire lambs of either sex.

Shepherds' prizes (3 entries), 1st Tom Bradbourn, shepherd for J. C. Andrews, 2d Dan Taylor, shepherd for Henry L. Wardwell.

Southdowns.—Exhibitors: Heart's Delight Farm, Chazy, N. Y.; Iowa State College, Ames, Ia.; J. Lloyd Jones, Burford, Ont.; Kansas State Agricultural College, Manhattan, Kan.; Robt. McEwen, London, Ont.; Ohio State University, Columbus, Ohio; University of Illinois, Urbana, Ill.

The awards: Ram 2 years or over (2 shown), 1st McEwen, 2d Iowa State College; 1 year and under 2 (6 shown), 1st McEwen, 2d and 3d Heart's Delight Farm; under 1 year (9 shown), 1st McEwen, 2d Iowa State College, 3d University of Illinois.

Ewe 1 year and under 2 (11 shown), 1st and 3d McEwen, 2d University of Illinois; under 1 year (15 shown), 1st University of Illinois, 2d and 3d McEwen.

Champion ram, McEwen on ram lamb; champion ewe, University of Illinois on ewe lamb; flock, 1st McEwen, 2d Iowa State College, 3d Heart's Delight Farm; pen of 4 lambs, 1st University of Illinois, 2d McEwen, 3d Iowa State College.

Costwolds.—Exhibitors: A. W. Arnold, Galesville, Wis.; Merritt Heath, Muncie, Ind.; L. M. Lee, Highgate, Ont.

The awards: Ram 2 years or over (4 shown), 1st and 3d Arnold; 2d Heath; 1 year and under 2 (2 shown), 1st Arnold, 2d Heath; under 1 year (4 shown), 1st and 3d Arnold, 2d Heath.

Ewe 1 year and under 2 (6 shown), 1st and 2d Arnold, 3d Heath; under 1 year (5 shown), 1st and 2d Arnold, 3d Heath.

Champion ram, Arnold on yearling; champion ewe, Arnold on ewe lamb; flock (3 shown), 1st Arnold, 2d and 3d Heath.

Dorsets.—Exhibitors: Hamilton Farm, Gladstone, N. J.; Hawthorn Farm, Lake County, Ill.; Heart's Delight Farm, Chazy, N. Y.; Kansas State Agricultural College, Manhattan, Kan.

The awards: Aged ram (2 shown), 1st Hamilton Farm, 2d Hawthorn Farm; 1 year and under 2 (3 shown), 1st Hamilton Farm, 2d Heart's Delight Farm, 3d Hawthorn Farm; lamb (5 shown), 1st and 2d Heart's Delight Farm, 3d and 4th Hawthorn Farm.

Aged ewe (6 shown), 1st and 2d Heart's Delight Farm, 2d Hamilton Farm, 4th Kansas State Agricultural College; lamb (7 shown), 1st, 2d and 3d Heart's Delight Farm, 4th Hawthorn Farm.

Champion ram, Hamilton Farm on yearling; champion ewe, Heart's Delight Farm on yearling; flock (3 shown), 1st and 3d Heart's Delight Farm, 2d Hawthorn Farm; 4 lambs, either sex (3 shown), 1st and 3d Heart's Delight Farm, 2d Hawthorn Farm.

Dorset Specials.—A, Best pair of ewes, with suckling lambs, Hamilton Farms, without competition; B, ewe, with twin lambs suckling, 1st and 2d Hamilton Farms.

Cheviots.—Exhibitors: Keith B. Clark, Clark's Hill, Ind.; Turney C. Collins, Leesburg, Ky.; E. Crall & Son, Evansville, Wis.; A. C. Grieve, Xenia, Ohio; Raymond D. Grieve, Xenia, Ohio; University of Wisconsin, Madison, Wis.

The awards. Ram 2 years or over (5 shown), 1st Clark, 2d Raymond Grieve; 1 year and under 2 (5 shown), 1st Clark, 2d Grieve, 3d Collins; under 1 year (5 shown), 1st and 2d Clark, 3d Collins.

Ewe 1 year and under 2 (6 shown), 1st Collins, 2d Clark, 3d Raymond Grieve; under 1 year (9 shown), 1st University of Wisconsin, 2d Raymond Grieve, 3d Collins.

Champion ram, Clark on yearling; champion ewe, Raymond Grieve; flock (3 shown), 1st Collins, 2d Grieve, 3d Clark; 4 lambs, either sex (4 shown), 1st Clark, 2d Collins, 3d Grieve

Minnesota Short-horn Breeders' Sale.

MINNESOTA Short-horn breeders have arranged for a very important show and sale to be held at South Saint Paul January 4 and 5, 1918. The show will be held on January 4th preceding the day of sale. Our readers will be especially pleased to learn that Mr. Frank W. Harding, of Waukesha, Wis., has consented to act as judge at the show. Probably no man in America is more capable of filling this position and his placings in the show ring will furnish valuable points to every stockman who is present. The sale starts at 10 o'clock on the morning of January 5th and there will be offered 86 head of well-bred Short-horn cattle, the pick of a large number of Minnesota herds. Included in this list will be Scotch, Scotch-topped and milking bred Short-horns. A great many of our readers attended the sale last year, which was one of the most important live stock events ever held in the Northwest. That the sale this year will excel last year's records seems to be certain. Breeders will appreciate the opportunity to see the animals in the show ring and to hear the comments of some of the nation's most successful breeders, before the offering is made in the sale ring. On the evening of January 4th the annual meeting nad banquet of the Minnesota Short-horn Breeders' Association will be held at the Saint Paul Commercial Club rooms. A splendid program has been provided. For catalog of this big sale write P. S. Jordon, secretary and sale manager, Morris, Minn. Please mention The Wisconsin Farmer in your letter. See advertisement on page 24.—Adv.

Herefords at Chicago January 9th.

SIXTY head of Herefords—50 females and 10 bulls—will be sold at Chicago January 9th, the cattle coming from the herds of Burch & Thompson and A. C. Bartlett, Lake Geneva, Wis. Included in the bull list will be the imported Eaton Druid (from the Bartlett herd, and the tried sire, Beau Gomez 2d, from the Burch & Thompson lot. Eight strong young bulls are in the sale. The female portion of the offering contains many attractions, and should be in demand sale day. Burch & Thompson are drawing heavily upon the best things in their herd in order to make the sale a very attractive one, while on the part of Mr. Bartlett it amounts practically to a dispersion, as his health is not of the best, and that, added to his inability to secure the necessary help to properly care for the cattle, makes it necessary that he dispose of his cattle. The entire offering is one of merit and strong breeding, and the attendance should be large and the bidding of the liberal kind. Catalogs will be issued by December 20th, and will be sent upon application if you write to Burch & Thompson, Lake Geneva, Wis. Kindly mention this paper when you write.—Adv.

Report Good Sales of Red Polls.

JOHN W. SALTER & SONS, Unity, Wis., continue to enjoy a good trade in Red Polls. They report the following sales made in the last three weeks: One female to Joseph Raab, Auburndale, Wis; one bull and two females to Fred Handke, Granton, Wis.; one bull to Wm. Jakel, Curtis, Wis., and one bull and one heifer to Ed Wettstein, Stanley, Wis. This goes to show that the Salter Red Poll cattle are in steady demand, for the monthly report from this firm always shows numerous sales. If interested in cattle of this breed it is to your interest to investigate the Salter Red Polls. Unity is their postoffice, a short way from Marshfield. See advertisement on page 22.—Adv.

Buys a Son of Giant Invincible.

FRED G. MATTHES, Viola, Wis., we believe is one of the coming Duroc men of the state. He is buying good stock and is a good feeder and these two essentials generally spell success. He has just purchased a son of the $2,500 boar, Giant Invincible. This is the only boar in the state sired by this great yearling and Mr. Matthes is fortunate in getting this boar for service in his herd. The pig is of late farrow, but has the necessary qualifications that go to make a good herd boar. Keep this herd in mind.—Adv.

The Edge Durocs.

WE want to say that Wm. C. Edge has a bunch of Duroc gilts that for size and uniformity cannot be beaten in the state, and when he puts them up for sale in the Grant County Duroc sale at Fennimore, January 25th, they will all acknowledge that he is a real hog man. The gilts have been bred to the $115 spring boar that was purchased in the Atwater sale. He is sired by Dreadnaught, a son of Illustrator. Others have been bred to a son of King Orion. Mr. Edge is located at Fennimore, Wis., and is secretary of the Grant County Duroc Association and you should send him your name so that you will get one of their sale catalogs. Please mention The Wisconsin Farmer.—Adv.

Cole's Poland China Gilts.

IF wishing to buy Poland China gilts that are good ones, write A. W. Cole, Lodi, Wis. Mr. Cole has about 20 and they compare with any we have seen in the state. They are big, yet they have that smoothness and quality that are so desirable. The price asked for these gilts is within the reach of anyone wanting registered Polands.—Adv.

News of the Sale Ring.

(Continued from page 15.)

to be as sensational a bull as the breed has ever produced, was sold for $31,000, the record price for a Hereford bull in this country. The bull was consigned by Walter L. Yost, of Kansas City, and the opening bid was $5,000, made by Frank Fox, Indianapolis, Ind., who with W. A. Pickering, Kansas City, Mo., and A. B. Cook, Helena, Mont., were contending bidders, Mr. Cook dropping out at $25,000 and Mr. Fox at $30,000, the bull going to the Pickering establishment on a bid of $31,000. Mr. Yost later secured Maple's Lad 61st, J. C. Robinson's aged bull entry, and which was placed in the sale at the last minute, for $10,000. The top female brought $2,500, that price being paid by Hamilton Farms, Gladstone, N. J., for Lady Panama 7th, consigned by A. B. Cook. Maple's Lass 57th, from the J. C. Robinson herd, went to Col. E. H. Taylor, Frankfort, Ky., at $2,400. The cattle were well distributed, going to buyers from 14 states. The general average on the 58 head sold was $1,774, the sale totaling $102,875. The 33 bulls averaged $2,400 and the 25 females $950. It was a sale that should be a matter of much gratification to the Hereford fraternity generally, as it sets a high water mark in the beef cattle annals of the country. Col. Reppert did the selling in his usual efficient manner, assisted by Magness and Miller. The detailed list follows:

FEMALES.

Lady Panama 7th, calved 1914; Gladstone Farms, Brunswick, N. J. $2,500
Maple's Lass 57th, calved 1914; Col. E. H. Taylor, Frankfort, Ky. 2,400

16 GALLOWAY BULLS and 50 cows and heifers for sale. Some imported cows and some good show cows. Special prices on these as I am overstocked. C. S. Hechtner, Chariton, Iowa.

POLAND CHINA SWINE.

The Sale of Sales

FEBRUARY 6TH—I will offer the greatest lot of BIG-TYPE POLAND SOWS ever cataloged for a sale in Wisconsin. The offering will consist of prizewinners and grand champions, bred to Mc's Big Bone, Postmaster, Jumbo's Giant, a son of Orange Boy, and a son of Gerstdale Jones. PLAN NOW TO ATTEND THIS SALE. Let me send you my illustrated catalog. Send me your name.
J. D. McDONALD :: :: :: :: **West Salem, Wis.**

Poland Boars for Farmers

HAVE A FEW smooth, good-footed spring boars for sale. They are big and of choicest breeding. GUARANTEED in every way. Also have a nice assortment of fall pigs—boars and gilts—and will price trios so as to interest you. I HAVE POLANDS TO SELL AND THEY ARE PRICED ACCORDINGLY. Try me.
H. H. SMITH **BARABOO, WISCONSIN**

Big-Type POLANDS

I RAISED 27 BOARS by eight different herd sires, and have a few choice ones left. Several by CHIEF PRICE 256331, who sired the first prize boar pig at Minnesota and the largest pig at Omaha. Some by Mc'S BIG BONE 257809, and such noted boars as ORANGE WONDER, BIG BEN JR., BLUE VALLEY KING, JUMBO WONDER and SUNRISE PRICE, out of sows that were sale toppers and state fair winners. Act quick if you want a boar. No gilts for sale until after January 1st. They will be in pig to my $500 OAKWOOD BIG MODEL, first prize senior yearling at Minnesota, Wisconsin and LaCrosse. Weighed 870 pounds in August. Correspondence invited.
W. W. QUACKENBUSH (Jackson Co.) **Melrose, Wis.**

SPECIAL PRICES ON FALL PIGS

I HAVE FOR SALE 40 pigs of August and September farrow, sired by Big Bone Wonder, the boar everybody is talking about; Smooth Price, a 1,000-lb. boar, and by Knoxail by the great Big Knox. There are some great herd boar and brood sow prospects among them. Am breeding 30 spring gilts, mostly by Big Bone Wonder, for March, April and May farrow. Also have some bulls of Glenwood breeding, half-brothers to the junior and grand champion bull at the Indiana State Fair, for sale.
L. P. MARTINY **Chippewa Falls, Wis.**

O. C. OLSON, STRUM, WIS.

IF YOU WANT TO BUY ANYTHING in big-type POLAND CHINAS write me. Have a large herd and can supply you with boars or gilts or matured sows. The pigs are sired by BIG TYPE JIM, a son of Jim Crow, and many of them are out of MAC'S CHIEF dams, the boar that was twice grand champion at Milwaukee.

P. N. COLLINS RIVER FALLS WISCONSIN

MY EARLY POLAND boars and gilts are all sold. Have a nice lot of August pigs, that will go cheap, by CHIEF PRICE and SMOOTH JUMBO. Yearling rams sold, some good Oxford lambs. A nice Short-horn bull calf from a heavy-milking dam. Write and tell me what you want—we can do business.

POLANDS

MARCH AND APRIL PIGS—The best we ever raised. They have the size and bone. Sired by six great big-type boars. See us for herd headers. Also dual-purpose Short-horn bulls.
M. MADSON & SONS **R. 4, Madison, Wis.**

IF YOU WANT TO BUY ANYTHING in big-type Poland Chinas, write me. Have five boars of March farrow. The pigs are sired by Big Type Jim Crow.
WILL TREADWELL **R. 30, Glenbeulah, Wis.**

MINNESOTA SHORT-HORNS

IN ANNUAL SHOW AND SALE

SOUTH ST. PAUL, MINNESOTA, JANUARY 4-5, 1918

86 HEAD OF SELECTED BREEDING SHORT-HORNS

The Minnesota Short-horn Breeders are offering in this, their second annual sale, 86 head of cattle selected from a large number of herds. Each breeder's entry or entries is to be an advertisement for the herd from which it comes. All the cattle have been inspected by a committee and the quality and breeding is assured. Last year's successful sale stands unsurpassed by any other association sale in the state and is indicative of the popularity of Minnesota Short-horns. Scotch, Scotch-topped and milking-bred Short-horns have been listed.

THE SHOW

which will be held on January 4th, the day preceding the sale, has been given special attention this year. Sec. F. W. Harding is to be the judge. Starting at 10:00 a. m., the entire day will be given to the show and judging. This gives you an opportunity to see the cattle in the ring before you buy and also the good advice of Mr. Harding is at your service.

THE SALE

starts at 10:00 a. m. January 5th.

THE ANNUAL MEETING AND BANQUET

will be held during the evening of January 4th after the show. A splendid program has been arranged and a good time is guaranteed, and every one is invited. Plates $1.50. Place, St. Paul Commercial Club Rooms. Auctioneer, H. O. Tellier. Judge F. W. Harding. SOUTH ST. PAUL, MINN., JANUARY 4TH-5TH. For catalog write

SHORT-HORN CATTLE.

Short-horn Steers Break World's Record

FORTY SHORT-HORN STEERS, weighing 1,692 lbs., bred in North Dakota, fed in South Dakota, topped the Chicago market July 9th at $14 per cwt., averaging $236.88 per head. They were part of a shipment of eighteen loads of Short-horns, 263 head, which sold for $55,025.39, averaging slightly under $210 per head. Market authorities pronounce this performance without a parallel for all time and regardless of breed. The Short-horn is the breed for you.

THE WISCONSIN FARMER

VOL. XLVI. NO. 52. THURSDAY, DECEMBER 27, 1917. WHOLE NO. 1874

Big-Type Polands Won Him Success.

J. D. McDonald, Now a La Crosse County Farmer, Has Had Wide Experience and Made Good Profits by Close Application to the Hog Business.

WHEN the hog sales on one farm amount to over $11,000 in less than a year, it may be safely said that the hog business on such a farm is going along very satisfactorily. It is because The Wisconsin Farmer believes that there are a great many farmers in this state who are neglecting their opportunities in the hog business that we take this opportunity to relate some of the experiences of Mr. J. D. McDonald, a breeder of big-type Poland Chinas, whose name is not only well known in Wisconsin, but in many other states as well. When a man applies the best years of his life and his best mental and physical energies to the hog business to improve the quality of his animals, other breeders and farmers in general are sure to notice it, as in the case of Mr. McDonald, and ready market will be found for the surplus as fast as it is available. Mr. McDonald's name has been associated with the town of North Bend, situated off the railroad in the southwest corner of Jackson county. For fourteen years Mr. McDonald has been plugging away in the North Bend neighborhood and establishing an ever-increasing demand for his stock among the swine men of the corn belt. His herd has been increased gradually from year to year as the demand for hogs has increased. Mr. McDonald's farm near North Bend was a good one, but the growth of his business has made it necessary to get nearer to a railroad station and he quite recently purchased the old Stubbs farm in La Crosse county, where better shipping facilities are available, and the results are already beginning to show the wisdom of this move.

Mr. McDonald's entire working capital and all that he owns today have been earned by hard work and close attention to business details. Without any help from home he began as a stock buyer a great many years ago and through his reputation for honesty and fair dealing secured enough business that he soon had the necessary capital for starting as a renter. Four years later he purchased the North Bend farm and at once branched out into the hog-breeding game in earnest. The foundation for the hog work had been laid long ago so that all that was necessary was paying strict attention to breeding always larger and higher quality hogs and more of them. At the same time Mr. McDonald began breeding Holstein cattle. Both the hogs and the cattle have been steadily improved and their quality is recognized by the live-stock men of Wisconsin and other states.

The Old Stubbs Farm Home, La Crosse County, Now Owned by J. D. McDonald.

An Historic but Ungainly Barn on the Old Stubbs Farm, Which Will Be Replaced by Modern Building.

Hogs Harvesting Frosted Corn on the J. D. McDonald Farm.

The La Crosse county farm comprises 122 acres of land, all tillable and of high fertility. The corn crop, which was frosted during September, might have been a complete loss, but Mr. McDonald turned the hogs into the fields and let them harvest the crop. On the North Bend farm the corn was also injured at the same time and hogging down was likewise practiced there. "I believe it is the best way for putting quick gains on pigs for market," said Mr. McDonald. "Of sixty hogs I had on twelve acres there I made gains of approximately two and one-half pounds a day. The hogs averaged 172 pounds per head when I turned them in and 222 pounds was their weight after the twenty days were up. The field had been pretty well cleaned up by that time, with just enough left in it to give plenty of exercise to a number of sows with fall pigs."

The exercise the hogs receive in hogging down a field of corn gives them a better appetite, in the opinion of Mr. McDonald, and permits them to make more rapid gains than when fed in the lot. Of course, for breeding stock such gains would, in his opinion, be made too rapidly, but for feeders it is the ideal method. On this particular field which the hogs had nearly harvested, sixteen aged sows and their fall litters are now rustling. They will gain in vigor by the exercise and their feed will not be too heavy, for it is regulated. Each day the herdsman goes over the field and scatters sufficient corn over the ground to feed the sows. The small amount which is left in the field of the crop will not make them put on flesh more rapidly than the brood sow should. Mr. McDonald figures that these sows will be in a better condition or at least fully as good as the sows which did not have fall litters and have been hand fed in the lot. The sows received some milk slop beside their corn ration, but nothing else. The field exercise also keeps the bowels in better shape than when the hogs are fed in the lot.

The hog-breeding work at the McDonald farm is carried on on a large scale. About 100 gilts and sows are bred each year and the offspring sold at the annual sale to other breeders and swine raisers all over the corn belt. There are always about 200 hogs in the herd forming the breeding stock, a few surplus boars and gilts.

Size and quality are Mr. McDonald's chief objects in all his breeding work. His hogs have both, as is evidenced by the numerous prizes which are won each year by the McDonald hogs at Minnesota, Wisconsin and Omaha. Boars like Crow's Progress, Matchless Wonder, Mc's Big Bone and sows like Miss Price 4th, Mc's Giantess and a row of others equally high in quality, all having the large Poland size with exceptional smoothness and quality, make up the herd. There is never a falling off in these points from year to year, but rather a steady improvement. One success does not cause Mr. McDonald to be satisfied and let down in the future. Each season's crop is as carefully contemplated as another.

In the dairy work the progress has not been as noticeably rapid, but all stock on the place earns its keep. There—[Concluded on page 6.]

GALLOWAY'S ELEVEN NEW SPREADER IMPROVEMENTS!

"Don't Buy Any Spreader Without Them."

—*WM. GALLOWAY*

I have perfected the manure spreader with eleven new improvements. These improvements are the greatest advanced step in the history of manure spreaders. They bring the manure spreader to its most efficient development. They mean **greater convenience and better spreading.**

Automatic push-board when unloading begins.

First, I built the Galloway new No. 8 Model low-down so you do not have to break your back to load it. Its light draft enables two horses to handle it as easily and cover as much ground as three or four horses can handle other makes. The patented **roller feed**, together with **large drive sprockets** and **double chain drive** are the secret of its light draft.

My **new steel beater** and **wide spreading V-rake** pulverizes the manure and tear the toughest clumps to shreds. My patented **automatic-stop, uniform clean-out** push-board mean there is **no shoveling** or sweeping to clean out the spreader box. The tongue is everlasting, because it is made of pressed steel. The beater teeth are extra strong and durable and do not break off. The double chain drive **direct from the rear wheels** makes it twice as efficient as single chain drive. Metal parts are finished with water-proof paint. You can adjust the Galloway to spread from four to twenty-four loads per acre.

BUY DIRECT FROM FACTORY

On My Money-Saving Plan

How the push-board carries the load to the beater.

Galloway spreaders are all **built complete** in our own immense factories at Waterloo. They are shipped direct to you from the factory floor to your field. You pay only the smallest manufacturer's price, based on a big volume of business. If you pay more than my price, you are simply paying for something that is not there. Many of the new eleven improvements on my new low-down No. 8 Model are patented, and are worth five to fifteen dollars more. But on the Galloway spreader they cost you nothing extra. Only on the Galloway can you get them. Besides these great improvements, I save you **big money** by selling **direct from the factory.**

WRiTE FOR TWO FREE BOOKS

Showing how clean the push-board empties the box.

I have written two valuable books on spreading. One of them I call the "Streak of Gold," because that's exactly what a streak of manure represents on your field. These two books go right to the heart of the Spreader question. They tell you about Spreaders—also the value of spreading and how you can revitalize your soil. I want you to have these two books and read them to find out how and why the Galloway Spreader with all these wonderful eleven improvements can be sold at so low a price. Once you have learned about buying from Galloway **direct from the factory** you will buy no other way. I make it possible to save you freight and ship from the warehouse near you at either St. Paul, Chicago, Council Bluffs or Kansas City, or the factories at Waterloo.

Write me tonight for the valuable book No. 9, and the book, "Streak of Gold."

HERE ARE THE ELEVEN SPREADER IMPROVEMENTS

See how they mean easier spreading and bigger crops

Send for these two Spreader Books. They tell you how to get the most out of your manure crop and how to judge and select a spreader. Write tonight sure.

When you write be sure to ask for Book No. 9

WM. GALLOWAY *President* **WM. GALLOWAY CO.** 39 Galloway Station **WATERLOO, IOWA**

CURRENT EVENTS

THE last three winters have found the fighting in the great war spasmodic, the severe weather where the armies were entrenched preventing any extended troop movements. This winter however, promises to be different and the decisive battle may be fought (or at least started) before winter is over. Owing to the fact that an armistice has been signed with Russia, Germany has been enabled to move great bodies of troops from the Russian battle lines to northern France and Belgium, where they are massed against the British, French and American troops. A terrific German drive is expected in northern France in a short time. The allies are said to be expecting this and to be prepared for it. Germany is in better condition now than it has been for some months past, owing to these reënforcements from the Russian front. While the two armies are thus temporarily resting on their arms in France, the Germans and Italians are hard at it in northern Italy. There is growing confidence in the strength of the allied forces to hold back the Austro-Germans from breaking through into the plains. The snow, which after falling last week only in sufficient quantities to make the frontal positions plainly visible, but not enough to obstruct the enemy's progress, has now begun again, and apparently in earnest. Whatever the results in Italy, war experts continue to believe that the decisive battle will be fought in France and no place else and that the result of the coming campaign there will go a long ways toward determining the war.

NATION-WIDE prohibition won in both houses of congress last week. If ratified by the legislatures of thirty-eight states, within the next seven years, it will become the law of the nation and the manufacture, transportation and sale of intoxicating liquors in this country will be a thing of the past. By a vote of 282 to 128 (more than the necessary two-thirds majority) the lower house of congress passed a resolution which reads as follows: "Resolved, by the senate and house of representatives, That the following amendment to the constitution be, and hereby is, proposed to the states, to become valid as a part of the constitution when ratified by the legislatures of the several states as provided by the constitution: After one year from the ratification of this article, the manufacture, sale or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and the jurisdiction thereof for beverage purposes is hereby prohibited. The congress and the several states shall have concurrent power to enforce this article by appropriate legislation. This article shall be inoperative unless it shall have been ratified as an amendment to the constitution by the legislatures of the several states, as provided in the constitution, within seven years from the date of the submission hereof to the states by the congress." This was passed by the vote of 141 democrats, 137 republicans and four independents. The next day the senate ratified this resolution by a decisive vote. The resolution must be ratified by three-fourths of the states, within seven years, when it will become the law of the land and the liquor problem will have been solved, another war victory in the way of reform.

THAT the submarine situation is decidedly improved and that shipbuilding is keeping pace with ship destruction is the statement made by the British naval expert, Arthur Pollen, who has been in the United States for the past six months. The campaign of the allied navies has at last resulted in keeping the world's ship tonnage from showing a monthly decrease, or soon will do so. Mr. Pollen gives credit for this success to the change in the chief command carried out by the British admiralty last spring and the participation of the American navy. Mr. Pollen pointed out that six months ago the German submarines were causing a net loss in the world's tonnage at the rate of nearly 25 per cent annually. While the present rate of loss is difficult to estimate, it appeared that last month Great Britain launched as much tonnage as she lost; the first ship laid down by the United States since the war has been launched and within the next twelvemonth a substantial portion of the 6,000,000 tons provided for in this country will undoubtedly be floated. Great Britain's shipbuilding program will similarly increase month by month and moreover, the campaign of the allied navies against the submarine will grow in value week by week, he said. In many respects, the submarine has been the greatest foe the allies have had to fight, so that the success of the efforts being made against it is decidedly reassuring.

NEW regulations prescribing the amount of wheat to be used by millers of the United States in manufacturing flour, detailing the manner in which the prices of mill feeds shall be determined and which are calculated to effect a saving of more than 16,000,000 bushels of wheat during the present crop year, were announced recently by the milling division of the federal food administration. The establishment of maximum prices for mill feeds relative to the cost of wheat is expected to result in a marked reduction in their price, and ultimately to lower price of milk and other dairy products. Prescribing the wheat content of flour, the statement says: "No licensee after December 25th shall use more than 264 pounds of clean wheat in making 196 pounds of 100 per cent flour." From the 100 per cent flour so produced the licensee may at his option, remove not more than 5 per cent of clear or low-grade flours, none of which may be mixed with or sold as feed. The 95 per cent of the 196 pounds of flour remaining shall not be subject to further separation or division. Millers are directed to establish, from time to time, a price at which each grade of flour will be sold in carload lots for a period of twenty-four hours after such prices are established, and until a new price is named by the licensee, all flour sold shall be sold at this figure. A margin of 25 cents per barrel bulk at the mill above or below this price is provided, however, for mills "in making a price to meet competition of mills in various territories." Bran is to be sold at a price per ton not exceedingly 38 per cent of the average cost of wheat to the miller, "shorts" and "middlings" are to be sold at approximately $2 per ton above the price of bran, mixed feeds at not more than $4 above this basis figure and flour middlings at not more than $9 above the price of bran.

GOVERNMENT plans for a billion bushel wheat crop next year to help the United States feed its allies, have received a setback. It was disclosed by the December crop report of the department of agriculture that while winter wheat was planted on the largest acreage ever sown to that cereal its condition on December 1st was the lowest on record for that date. A winter crop of 540,000,000 bushels was forecast by the bureau of crop estimates. The actual production will be greater or less than that quantity, according as conditions hereafter are better or worse than average. Although a great spring crop still is hoped to bring the year's total to somewhere near the billion mark. An area of more than 47,000,000 acres was the mark set by the government for farmers to plant to winter wheat this fall, but the December canvass shows that 42,170,000 acres were sown. The farmers did their best, department of agriculture officials say, but conditions were against them. The very dry weather in most of the winter wheat belt was a large drawback, while late harvest of other crops and shortage of farm help were contributing causes for the failure.

THE most that may be expected from a war-time economy campaign is curtailment of luxuries, not a complete abandonment, said Frank A. Vanderlip, natinal director of the war savings movement, in an address. Consequently, he said, business will not be disorganized by even a well-developed thrift campaign. "In the first place," said Mr. Vanderlip, "this campaign of economy is not going to be 100 per cent efficient. There never was a crop approaching the crop that was produced this year in value, $21,000,000,000, against $8,000,000,000 the year the war broke out. Now farmers with all this wealth, workmen with all this added income are not going to be universally economical. The experience of England was that there was not dullness, but great activity in luxuries. The best we can do will only be to hold down this activity in luxuries. No one needs to be alarmed that we are going to suddenly disorganize all business. If each and all of us will do our best with our own affairs and do our best to carry the lesson to others, we may open the workshops sufficiently for the government to perform the tremendous duty that is expected of them. The great work of the day is to win this war." Mr. Vanderlip is the New York financier who resigned a position paying $100,000 a year to take a job with the government, paying the nominal sum of $1 a year. He conceived the idea of putting the war savings stamps on the market, selling them at 25 cents and $5 each. By this means the government hopes and expects to raise $2,000,000,000 with which to aid in carrying on the war. Mr. Vanderlip is a grain-belt product, having been born in Illinois, and is one of the leading men of the nation.

A WARNING to farmers not to ship hogs, but to hold them back for the present in order to avoid falling prices was sent out by J. P. Cotton, head of the meat division of the food administration. In a written statement he said: "Hold back your hogs. On November 2d I stated that the prices of hogs so far as this division could affect them, would not fall below about $15.50 per hundredweight for the average of the packers' droves in Chicago market until further notice. That statement I make again. The packers inform me they are doing their best to aid us in that policy; but largely owing to transportation difficulties in the East, there is now a glut of hogs on the Chicago market, and more hogs than the packers can kill and handle. The farmers and commission men in this territory must help by holding back hogs temporarily, especially from the Chicago market. If there is coöperation, the minimum will be maintained. Do not sacrifice your hogs by dumping them on an overcrowded market."

The Wisconsin Farmer

THURSDAY, DECEMBER 27, 1917.

FAMILY CIRCLE TALKS BY THE PUBLISHER

A NEW YEAR'S MESSAGE.

WE ARE face to face with another year. What does it hold for us of weal and woe? How shall we face its trials, withstand its temptations, repay its successes? These are questions which dominate the thoughts of every one of us as the old year draws to a close and we take stock both of the past and of the future.

We of the farm have had a most prosperous year; our fields have produced abundantly, the prices which we have received for our products have been far in advance of ten-year averages. We have been given the recognition which has always been our due, but which was all too long withheld. The world knows now that success or failure for our armies depends, in the last analysis, upon our efforts in feed lot and field. In many ways 1917 has been the most notable year in the history of American agriculture. Yet I firmly believe that 1918 will surpass it.

We must not content ourselves this year with glib repetitions of "A Happy New Year." We must dedicate ourselves to making it a happy year, all the twelve months through, not only for ourselves, but for all the peoples of the earth. We must feed them and clothe them. We must fight for them, that the world may be made better for all; not necessarily fight with rifle and grenade, but with pitchfork and gasoline engine, plowshare and rake. We are the soldiers of 1918, though we wear no uniform save tattered overalls. We fight under sealed orders, knowing only that the "end of the row" is the goal we are struggling for, and that just so far as we fail to make the end of the row we are derelict in our duty and remiss in our patriotism. Let us fight the good fight and reach the "end of the row" for the noonday rest under the peaceful shade.

There is not one among us—not even the mother of Merle Hay, the grain-belt farm boy who was the first American soldier to lose his life fighting in France—but has something to be thankful for as the new year dawns. If there are absent ones, there are sweet memories. If there are sorrows, somewhere the rift is beginning to appear in the encompassing clouds. If there is pain, sometime the solacing hand will be laid upon our brows. It is for us to bear the heartaches of absences, the sorrows and the pains, and (seeing the good in the bad and the happy in the unpleasant) make our way cheerfully and with smiling faces, no matter where the road may lead. It is not all smooth, level road, without turn or upgrade, to town; neither is it all smooth, level road, without turn or upgrade, through life. I often think of the road which the South Sea island natives built up the mountainside to the home of Robert Louis Stevenson, the only white man who had cast his lot with theirs, who had championed their cause by word and deed and who was their friend in every crisis. They toiled laboriously under the burning, equatorial sun, and when the road was finished they called it the "road of the loving heart." Let us build a road of the loving heart straight from our house to that of our neighbor, girdling the nation with a highway of sympathy, brotherliness and good will toward all men.

When it came time, a week ago, to give my annual Christmas message, I let my readers talk for me. Now that it is time to give my annual New Year's message, I am going to let a reader talk for me again. I do not have the pleasure of personally knowing the writer of the following letter, but I do know (from her words) that she goes about her work with a shining face and a song upon her lips. Can't you hear her singing "Beulah Land" as she washes the dishes, "Brighten the Corner" as she puts the kiddies to bed? Read her letter; you can fairly see her eyes sparkling as she wrote:

Dear Mr. Pierce: After reading your Thanksgiving thoughts I want to tell you some of the things I am thankful for every day. But just for fear someone may not say I do not understand, I will tell you that I was orphaned at eight years of age and I knew what it was to go from "pillar to post," to be separated from my parents and sisters, to make new ties in new homes, to plant my heart there only to have it uprooted and pushed out again and again. I have known what it meant to be lonely, to hunger for affection and a home, and I am not the sheltered wife of a wealthy farmer—we are renters.

Ten years ago I married the man of my choice, a poor man. A year later a little son came to us, which resulted in three years' invalidism for me, with attending expenses and doctor bills. I tell you this that you may know I have had my sorrows, too, but every day I thank God for wifehood, for my good husband, for motherhood. I thank him for strength to work for my loved ones. I thank him for the privilege which is mine to fill every month, every week, yes, every hour, full of happiness through loving service and sacrifice for those I love.

Then I thank HIM that I know whatever the future may hold for me of weal or woe, as long as life lasts nothing can take from me the golden memories of the last ten years of my life. I know that if my husband is called to France, I shall find consolation in knowing that he knows I did all in my power to give him happy memories to fortify him in times of suffering, loneliness and temptation, and I thank God that I have reached the place where I can say "Thy will be done" if my husband must serve his country in that way rather than some pleasanter way we might choose. Only one who has "passed through" can appreciate the agonies of doubt and rebellion one must endure to gain the consent of the heart to say "Thy will be done," when it means separating us from one dearer than life itself. May God give us a spirit of gratitude and wisdom.

MRS. OLA JOHNSON.

Can we not all say a hearty "Amen" to this splendid sentiment? I know I can, and I believe every one of you will join me. "Thy will be done" and "God bless us every one"—these are the words I would speak in every farm house in America's grain belt, if I could but open the door, call in a brotherly greeting and go my way. How much more they mean, in our present crisis, than just a mere "Happy New Year." They sum up all our hopes and fears, all our prayers and tears. I thank Mrs. Johnson for writing such a timely and appropriate New Year's message as I myself never could have hoped to write.

FARM MORTGAGE RATES INCREASED.

I REGRET that the Federal Farm Loan Board has found it necessary to raise the interest rate on loans from 5 per cent to 5½. The general upward movement of interest rates is given as the cause. Inasmuch as there are applications for something like $300,000,000 in farm loans now pending before the board, this increase means that the borrowers will have to pay $1,500,000 more interest annually, on this amount, than they would have paid under the old rates. I am glad to be able to assure those who have already borrowed from Uncle Sam's new land banks that the raise in rates will not affect them; it simply applies to loans to be made in the future.

It is always regrettable that a system cannot be perfected, rather than hampered, with the passing of time. Had the Federal Farm Loan Board started out with loans at 6 per cent and then reduced the rate, at this time, to 5½, the general effect on the borrowing public would have been better. As a system or law becomes perfected through use and familiarity, it is generally administered with less expense and friction. Possibly no one could have foreseen, when the interest rate was established some months ago, that the money market would become as unsettled as it is today; but the government must make its mortgage rates considerably below that of private loaners (to offset the red tape of forming or organizing loan associations, subscribing to stock and guaranteeing other borrowers' debts) or the new law will not meet the need which created it. It is highly probable that insurance companies, commercial loan companies and others which have supplied the bulk of farm mortgage funds heretofore will likewise be obliged to raise their rates, in the near future. If this is the case, Uncle Sam's banks will continue to loan below the commercial rate and the new law will be given a thorough and efficient trial. If private loaners do not increase their rates and the federal land banks loan at only ½ or even 1 per cent below them, the average farmer will continue to patronize local loaners or agents and Uncle Sam's banks will suffer a loss of patronage.

This is really the crucial hour for the new financial system which was designed to give help to the farmers, but which has not been in actual operation a year before it is found necessary to charge farmers a rate so close to that which existed before the law was adopted that but little real relief is in prospect from its administration.

JOIN THE RED CROSS.

I FIRMLY believe that no organization in the world is doing a more needed or better work than the Red Cross Society. It alleviates distress whenever and wherever found. The explosion at Halifax had hardly subsided before Red Cross chapters all over America were taking the necessary steps toward relief; trains with food, shelter tents, medical supplies, doctors and nurses were rushed to the stricken city. It is the same in every great disaster. The Red Cross works in times of peace and of war, among people of all colors, creeds and conditions. It is the great mother of humanity—all suffering people are her children.

The American Red Cross is making a "drive" for membership. I earnestly hope that every one of my readers who can possibly afford it will join. A membership costs $1 a year, a very fine, high-grade magazine being sent to all who pay $2. The society hopes, however, the head of every family who joins will add $1 for each member of his household, so that all America will be enrolled. Thus, if the family consists of a man, his wife and two children, the sum of $5 is hoped for, $2 for the membership for the father or mother (whichever one takes it) and $1 for each of the others, with the magazine coming for a year. The cause is a worthy one, the need is great.

I know that there are many calls for money nowadays, they come almost incessantly. Yet we of the farm are enjoying widespread prosperity. We produced farm crops this year to the value of $21,000,000,000. Shall we not divide with the needy, the suffering and the deserving? Shall we not aid an organization which goes about doing good, asking no questions, only that there be real need? Let me urge upon as many of you as can that you join the Red Cross Society, so that this relief work may continue unimpaired by the need of funds. Should want come to you and yours in some far-reaching disaster, the Red Cross would be the first on the scene to bind up your wounds, put a shelter over your head, fill your mouth with food and see to it that you got on your feet and had a chance to be a man again.

A GOOD OLD WORLD.

THERE never was any doubt in my mind, but now I know it to be true beyond all dispute: It's a good old world, after all. I have had this fact impressed upon me hundreds of times within the last few weeks, ever since I printed the letters from the mother of six children and the little eleven-year-old girl whose father had died recently, who was in real need and who added, "Don't print my name, people might laugh at me." The response from great-hearted, generous men and women of the farm has been so widespread and so magnificently liberal that one could never for an instant harbor any other thought than "It's a good old world, after all."

I cannot give much more space to letters from those who write to me seeking aid and those who write to me offering to relieve distress. While nothing is more important (or interesting to me and all of you, I believe) there are a multitude of matters we must discuss together, and variety must be maintained in our reading just as in our diet. But I cannot refrain from telling a few incidents which have come under my notice, in connection with this "real charity."

For instance, one mail this week brought me three letters from three men, each one of whom had been touched by the need of the farm mother and the farm girl, each one of whom sent their "mite" in the form of a check to relieve worthy cases. I am going to print these three letters, simply omitting the names of the writers, for charity must go about unidentified and unheralded if it is to be real charity. Here was the first I opened:

Dear Mr. Pierce: Enclosed find money order for $5 to be sent to the little eleven-year-old girl who didn't want to be laughed at. I am a bachelor farmer, so have no clothing she could use, but I hope she can get something she needs with this money.

Here is a man who loves children, even though he has none. He has the satisfaction of knowing that he played Santa Claus to a deserving child. The second letter reads as follows:

Dear Mr. Pierce: After reading your paper of December 6th I am sending you my check for $10. Now, Mr. Pierce, I am going to leave the use of this money entirely to you. I want you to apply it where you think it will do the most good. God pity the fatherless children and all those dependent on His mercy.

I whisper a hearty "Amen" to the last sentence and assure my good friend that his money went where it is most needed and where it will brighten many hearts. The third letter was longer. I print it in full:

Mr. James M. Pierce. Friend: I will call you a friend, for I verily think you are a friend of all the farmers. I have been a reader of your paper ever since it first came out, and unless you change I will continue to be one so long as I live. Week before last I read of some in need in your paper. I will send you a check for $20. Divide and send to those

THE WISCONSIN FARMER

A WEEKLY JOURNAL OF AGRICULTURE, HORTICULTURE, STOCK RAISING AND ALLIED INDUSTRIES.

BY JAMES M. PIERCE

JAMES ATKINSON, EDITOR-IN-CHIEF

ESTABLISHED IN 1848

Entered at Des Moines Postoffice as second-class matter.

PUBLISHED EVERY THURSDAY

1912 Grand Avenue Des Moines, Iowa — 201 Washington Bldg. Madison, Wis.

To either of which communications relating to subscriptions or advertising may be addressed.

Member Agricultural Publishers' Association. Member Audit Bureau of Circulations.

SUBSCRIPTION RATES—Single subscription, $1.00 a year. In clubs of ten, 75 cents a year and an extra copy to getter up of club. Single subscription three years in advance, $1.50; five years in advance, $2.50; ten years in advance, $5.00. Subscription price in Canada, $1.50 a year. Remit by draft, registered letter, postoffice or express money order. In changing address, send both the old and new addresses. In renewing, give the same name and initials as before or state both the old and new names and explain why you change. In case of errors or failure to receive the paper within two weeks, promptly notify the publisher. Address
THE WISCONSIN FARMER, Madison, Wisconsin

Why Milk Prices Are High.

Fred Pfeuhler, official tester of the Wolf River Cow-Testing Association, Door county, Wisconsin, has made a comprehensive report showing the opportunity which presents itself to the farmers of his section in the nation's present crisis, and the importance of watching feeding rations. We quote from a recent report of Mr. Pfeuhler:

The farmer raises the food that feeds us. His cotton fields and his sheep give us the clothes we wear. He furnishes us the necessities of life and a generous surplus which is sent to all corners of the earth. His peaceful fields, well planted and tilled, support everything in the world—the industries art, sciences, humanities and those countless clusters of human life which we call cities.

His has been the biggest job—that of starting the world and keeping it going—but he has done it cheerfully, never seeking praise or glory.

While the cities have bought and sold, and grown rich, and fat, he has whistled and laughed, planted and harvested, working twelve to sixteen hours a day with never a murmur. This nation, gathering riches from all the world, almost forgot to whom it owed first of its achievements.

It has taken a great calamity, the world's greatest war, to remind us of what we never should have forgotten—that the farmers are carrying the destinies of nations; that our welfare, yes, even our very lives, depend solely upon his work.

Today finds the American farmers charged with a duty that in ordinary times would be shared equally by the farmers of all nations. Three years of war have so shifted the burden of producing the world's food that never in the history has so great a responsibility been placed on any class of people as rests today on the farmers of America.

As they have met every crisis in the past American farmers are at the world's service today, if they will be guaranteed a fair price above the cost of production of their products.

While all these fine things may be said of the farmer, Mr. Pfeuhler and others who have studied the case understand that the farmer must be given a fair deal in a business way. It has been possible to gather some valuable information in connection with the work of the Wolf River Cow-Testing Association. Mr. Pfeuhler found that in Herd No. 18 of his association the cost of producing 100 pounds of milk testing 4.3 per cent during the month of November was $2.40. The value of the the butter fat at 60 cents per pound was $2.58. The divisions of feeds are as follows:

164 pounds silage.
8[illegible] pounds alfalfa hay.
2[illegible] pounds grain.

This gives, according to Mr. Pfeuhler's statement, a net profit on 100 pounds of milk, above the feed cost alone, of only 18 cents. This includes no profit for investment in land, equipment, or cows.

Of course the herds do not run all alike. Herd No. 20, where 4.6 per cent milk was produced, the cost was $1.82 for each hundred pounds and this butter fat sold at 60 cents per pound and netted $2.76. The feed required to produce 100 pounds of milk in this herd was:

326 pounds silage.
42 pounds clover hay.
26 pounds grain.

This herd showed a net profit, above the feed cost, of 94 cents per hundred pounds.

Herd No. 21 produced 100 pounds of 3.8 per cent milk for $1.66 and this netted $2.28 for the butter fat. The feeding ration was:

458 pounds silage.
No hay.
25 pounds grain,

leaving a net profit of 62 cents per hundred pounds.

In Herd No. 22, 100 pounds of 5 per cent milk was produced for $3.47 and the butterfat value of this milk at 60 cents per pound was $3.00, leaving a loss of 47 cents on each hundred pounds of milk. The feed of this herd was:

276 pounds clover hay.
25 pounds grain.

This shows where the farmer gets off without any silage.

In making up these figures silage value has been estimated at $4 per ton; alfalfa at $30 per ton and clover hay at $20 per ton. The price of grain varied in the different herds from $51 per ton to $60 per ton.

Mr. Pfeuhler's statement illustrates the fact that feeding must be given great study to insure profits. It shows that silage cuts the cost of feeding without diminishing the flow or quality of milk. On the contrary good silage improves these conditions. To feed high-priced grains entirely is a waste. It is the duty of farmers and dairymen to produce as economically as possible and when they do this they have a right to expect a fair price and a fair profit for their product.

Get Needed Spray Materials.

Orchardists, and farmers who have small home orchards from which they are anxious to get as much good fruit as possible, should take steps immediately to secure what spraying materials will be needed next spring. This is a matter that should not be delayed for any length of time, because there will undoubtedly be a great scarcity of some of the insecticides that will be needed to hold the codling moth and other insects in check. Then, too, it is likely that prices of spraying materials will be higher next spring than now; at any rate, it is a practical certainty that they will not be lower. Another thing to consider in this connection is the freight congestion that exists everywhere, which may be greater towards spring. The sooner spraying materials are ordered, the better the chance of securing them will be, and the lower probably also the cost.

Spraying materials should be purchased coöperatively, especially for farm orchards, so that they may be secured in large quantities and at a considerable saving in cost. If you have no local coöperative society see your county agent and let him find out what other farmers in the county need similar materials and then order them all together.

We should spray our fruit trees every year, but an unusual effort to spray should be made next year and as long as the war lasts, because every particle of food that can be produced will be needed. It is the next thing to a crime in these days of food scarcity to allow the products of the orchard to be ruined by insects when a very few dollars spent for spraying materials will remedy this fault and more than pay the cost of spraying in work and material by the production of a larger crop of fruit of superior quality.

Marketing Wisconsin Unfinished Pigs.

A strong appeal is being made to farmers of the state not to market their young pigs unfattened. In portions of the state where there is no feed, or at least not sufficient feed to take care of the pigs raised, farmers should make an effort to market their unfattened pigs to other farmers in Iowa, Illinois or Indiana who have milions of bushels of corn, good enough to feed, but too soft for the market. These farmers prefer to feed this corn rather than to take the risk of dumping it on the market in its present condition. It is reported that one Illinois county is in the market for 50,000 pigs, preferably weighing from seventy pounds to 125 pounds each or even a little heavier. An Indiana county agent has wired the president of the Wisconsin Live Stock Breeders' Association that he can take all the feeder pigs which Wisconsin has to spare. A good many carloads of such pigs have been already forwarded to feed lots in Illinois. Prices have run from $11 to $17 per hundredweight, but few Wisconsin farmers are willing to sell at a lower figure.

Blanks have been made out and furnished county agents of the state and the emergency food agents in an effort to list up all of the pigs, weighing from seventy pounds to 125 pounds or less. These blanks can be secured from the county agent, who will get in touch with feeders in Illinois, Iowa and Indiana and undertake to make arrangements for purchase of the pigs in Wisconsin.

As a patriotic proposition it is better to send the young pigs to some locality where they can be properly fattened. To sell them in the markets at such small weight as seventy pounds to 125 pounds is simply to cut down the pork production in the country and this is just exactly what the food administration is making every possible effort to avoid.

The Old Year: "I hope your burdens will be lighter !!"
The New Year: "I hope so, but I'm willing to carry heavier burdens, if it's necessary to win the war !!"

Heredity in Animal Improvement.

An interesting contribution recently appeared in the Live Stock Journal relating to the part that heredity has played and must always play in the work of animal improvement. It is pointed out by the author of this article that heredity, the foundation law of all animal breeding, declares that "like begets like" and, therefore, in breeding operations, it is important to select parents with as many desirable points and as few objectionable points as possible if any improvement on the progeny is to be expected. The effect of near and remote ancestors is discussed and also the question of prepotency, correlated characteristics and the outcome of the practice of continuous selection with certain definite things in mind. Among other things, the author says:

Heredity is a broad term, it is not simply the relation between the offspring and its parents, but the relation between it and its whole back ancestry. According to Galton's Law of Ancestral Heredity, an animal is the sum product of all its ancestors. The two immediate parents contribute between them one-half of the effective heritage, the grandparents one-fourth, the great-grandparents one-eighth, and so on, so that the effective contributions of the successive generations would be represented by the fractions one-half, one-fourth, one-eighth, one-sixteenth, etc., and the total heritage would be the sum of these fractions, which, extended to infinity, would equal one, thus accounting for the total heritage. This general law applies to generations, not to individual ancestors, and these fractions should be still again divided by the number of ancestors in each generation in order to determine the fractional share contributed by each individual ancestor.

Every ancestor, remote or present, has some influence. But the influence of an ancestor diminishes very rapidly the more distant in generation it is, and an animal in the sixth generation back has practically no influence. It is the "top," rather than the "foundation," that tells.

Although every animal inherits all the character of its two parents, the great majority of those characters never develop visibly in the animal, but lie undeveloped as "latent characters," and may be transmitted on to the next generation and appear as a visible character of these animals. These latent characters account for the occurrence in all breeding operations of animals totally different from their parents, but closely resembling their remote ancestors in some one striking feature, generally color. This is called atavism, or reversion to original type. To the breeder it is of no practical importance, but every animal of such a character should be discarded for all breeding purposes.

When two animals of different character are mated, the resulting progeny will inherit certain noticeable or dominant characteristics from its parents. Other characters will be possessed by the individual, but will not be noticeable, and hence are called recessive characters. These latter are the more numerous, and, all things considered, it is safe to say that the visible and fully-developed characters of an individual constitute but a small proportion of his real possessions. Hence the uncertainty of breeding; we cannot always tell what an animal is like for breeding purposes from outward appearances. An animal of proved worth for breeding purposes is an invaluable asset, and should be retained as long as its vitality lasts.

A prepotent animal is one which can overcome the characters of the other parent, and stamp its own character strongly upon the offspring. A purebred animal is very prepotent when crossed upon a grade or common stock. Animals of the same ancestry differ conversely in their breeding powers. Individual excellence is not a certain guide to breeding powers, and many ordinary individuals are among the greatest breeders. This is neither a mystery nor a fault in heredity. It arises from the fact that individual excellence is partly a matter of individual development, and not a sure index of rich ancestral possessions. The animal may be only fairly well born and faultlessly developed, in which case it will probably be a disappointment as a breeder; or it may be excellently born, but only fairly well developed, in which case it will breed "better than it is itself;" still again, it may be well born and perfectly developed, and be both an ideal individual and an ideal breeder, which is best of all.

Certain characters are correlated. An animal with great length of rib and depth of barrel is always a good feeder; milk production with the triangular dairy form; while the thick, meaty, square type of beef cow always indicates a lack of milk-producing power. This law of correlation illustrates why we can never produce a type of cow that will equal the dairy type for milk production, and at the same time produce steers that will be able to compete with the progeny of special beef breeds. In all breeding operations, we must follow nature, and if two qualities will not breed well together, we must drop the one least essential and adopt other qualities that are correlated to the one we most desire.

We have seen from the law of heredity that an animal is of a very complex composition. All the influences of ancestors are striving for mastery, and

Family Circle Talks by the Publisher

(Continued from page 3.)

you think most in need. Do not mention my name in any way. We are not what you would call "well off," but not in want, as we own 320 acres of Iowa land, not quite all paid. I wish you a very Merry Christmas.

I treasure that letter and shall keep it always. I am glad, indeed, that I am considered a friend by a man so great hearted and so tender hearted. Such men, of a truth, are the salt of the earth.

I divided this money (and more which I have received) among a half dozen worthy families. I cannot tell the story of all, but I am going to print extracts from their letters, showing the plight they were in. You will understand from these brief extracts how much good the money I forwarded to them will do. Each paragraph below is from a different writer, a few from many scores received by me during the last fortnight:

My father is sick and can no longer work very much at a time. My mother works all the time and saves and tries to make ends meet, but it is impossible. There are ten of us and five to send to school and they have such a long ways to go; it is three miles, and have not half enough clothes to wear. I am a girl of sixteen and I help with everything I can, outdoors and indoors. I have even held the plow and cut wood when my father was unable to work and I mean to do everything I can so long as I can help keep their dear little bodies warm, but as long as I cannot do everything won't you please try and help me and I hope to be able to help some other poor person some day, for I surely will be thankful.

• • •

I wish you could help us, as we have had some pretty hard luck in the thirteen years of our married life. We have six children living (two dead) and it is sure hard to get clothes for them, where we have had a crop failure four years out of five. We are renting and are in debt almost hopelessly.

• • •

Surely God will bless the good you have done and are doing. I am mother of a large family and it is hard to make both ends meet. We have had two failures here and husband is not very strong. We have eight little children and it is hard to get their winter clothes.

• • •

I have four children, from two to twelve years of age, and we are proving up a homestead. All who have proved up homesteads know what one has to go through. My children have to walk two and one-half miles to school and have not the necessary clothing to keep their poor little bodies warm.

• • •

I have five little children who need some help very badly from some kind heart. The youngest is seventeen months and the oldest is eight years. The two oldest go to school, but need some clothing very badly. The father has worked hard all summer for $40, nothing furnished, and we have to pay rent. We have had sickness this fall, as the oldest boy was operated on in October and the father was also operated on this fall and has not been able to work since. Our little girl has just got up from pneumonia. Now we are very badly in need of food and clothing and bedding. We are out of flour and have no money to buy any with; we are also out of sugar and lard.

Within the last few weeks I have received scores of letters such as these; every one wringing the heart to read. It is going to be a hard winter in many a humble home; are we doing all that we can to minimize suffering? I have received hundreds of letters offering to send clothing; every one has been appreciated and answered. But many families need money, and some of their wants are being met by the great-hearted men and women of the farm who have sent their checks to me, as did the three men whose letters I print above. It is a good old world, after all; yet how much misery and sorrow and suffering there are in it.

James M. Pierce

we never know which will predominate in the offspring. As a result, no two animals are alike, and even offspring from the same parents are very dissimilar. Variability is an inevitable accompaniment of both reproduction and development, and in breeding variation is to be expected. But this very variation in animals is a source of strength to the breeder. Without variation no improvement would be possible. The parents may be regarded as the average type, and their offspring is distributed both above and below that average, some being better and some not so good. The breeder's object is to select the animals above the average, and breed from these. The whole keynote of breeding is selection, continuous selection. Selection is the most direct and powerful means of improvement at the disposal of the breeder, and is the only means of permanent improvement that is under his direct control.

The great and famous breeders of past days developed and founded breeds in the short space of one lifetime by rejecting a multitude and selecting a few. If selection is not practiced, no improvement can be obtained, as the average of the breed or herd will remain unchanged. Continued selection will shift the type in any desired direction, and after a few generations it will "breed true" in its new form. As variability is not greatly reduced by selection, there is always opportunity for improvement as long as selection continues.

Before selection can be carried out intelligently, an ideal type must be adopted. Once chosen, the standard must be preserved unchanged. One may raise it by adopting an improved standard as one expands in breeding wisdom, but one must never change it, or all one's former breeding operations are nil, and a start must be made at the beginning again.

In selecting breeding animals, utility points are of prime importance. The ideal breeding animal should be a good individual, a good performer and a prolific breeder.

Further attention is called to the fact that the sire is even more than half the herd, being half the first generation, three-fourths of the next, seven-eighths of the third, and so on. By judicious selection of the sire for a few generations the character of the herd may be determined and, because of this, special attention should be given to selecting the sire to cross on pure-bred animals. It is pointed out that the beginner had better buy ten or twelve average females and a good sire than to invest in four or five exceptionally good females. The larger number of cows with a good sire will simply afford a better opportunity to obtain exceptionally good individuals.

Splitting Potato Eyes.

Seed potatoes were high in price last spring and growers were using every possible means to obtain a crop by the use of as little seed as possible. In some instances potato parings were planted and in other cases men were so economical in the use of their seed as to split the eye. Men could be found who have no faith in the latter plan, but believe that this results in destroying the eye absolutely.

In order to test the matter out the experimental department of the Emerson-Brantingham Implement Company conducted an experiment during the present season by planting severed eyes. One eye was divided into two parts and each part planted in a hill by itself. Soil conditions were exceedingly unfavorable, but one of these half eyes produced three potatoes and the other four, or an average of three and one-half potatoes per hill. When an eye was cut into four parts and each part planted in a hill by itself two and three-fourths tubers per hill were produced. The matter was even carried further and one eye cut into six parts, the result being that each hill from these six parts produced an average of one and one-half tubers. There was but little variation in the size of the potatoes from the different cuttings, but it will be observed that the smaller the cutting the less the yield in the number of tubers. The two hills from the one eye produced seven potatoes, while the four hills from one eye produced eleven potatoes and on the other hand the six hills from the one eye produced nine normal potatoes in addition to two that were so small as to be unfit for use. In the latter case there was one blighted hill that produced nothing.

The conclusion to be drawn from this little experiment is simply this, that split potato eyes will grow. On the other hand, the reduction in the number of tubers per hill when the division becomes too fine would indicate that the practice of cutting the eyes is not on the whole a profitable one. The matter is of special interest to those who use the fork or cylinder type of potato planter, because it shows that eyes pierced or split by the planter forks which catch and drop the pieces into the furrow are not necessarily destroyed, but may perhaps grow almost as well as whole eyes. This is important in these times when so much is being said and done in favor of utilizing machine instead of hand power in every possible way.

Automobile a Farm Necessity, Not a Luxury.

A recent announcement emanating from the treasury department of the United States brings the information that the upkeep expenses involved in operating a farm automobile, including gasoline, tires, etc., may be deducted from the income of the farm in the making out of the federal tax statement. Just as one deducts from his total revenue the amount of interest paid during the year as well as the amount of his taxes, so may he deduct the expense involved in the upkeep of his automobile. It is the theory of the government that the farm automobile is not classified as a luxury, but a necessity, and the recommendation of this classification really puts the auto in the class to which it properly belongs.

It must be borne in mind that horse breeding operations in recent years have been carried on with due allowance being made for the auto taking the place of the driving horse. The farmer has been encouraged in every possible way to breed drafters and his assurance that the future will find good draft horses selling well has resulted in changing the basis of breeding operations entirely. A shortage in the automobile supply as affecting farm interests would seriously handicap production. Many forms of produce are now marketed quickly by the auto, including in many cases the delivery of cream at the central station or to local markets. When repairs for machinery are needed trips can be quickly made over a considerable distance if necessary and time saved in that way during the seeding and harvesting season. The type of horse we are breeding today is not adapted to road work save only in those cases where heavy loads must be hauled. If we are obliged to place our drafters in road service, their use on the farm will be interfered with to that extent, and at a time when the draft horse supply is insufficient to meet the needs of the country.

Presumably the apportionment of steel products will be largely made by government authority and it is a splendid omen that the government has already recognized the great utility of the farm auto, and it may reasonably be expected that in the apportionment of steel and other materials utilized in the construction of an auto much in the successful conduct of this great industry that means so farm affairs will not be neglected.

Renew Subscriptions Early.

It will be a great help to Uncle Sam if subscribers will renew their subscriptions now. So many young men engaged in the postal service have been called to the colors that in places the work of the postoffice department has been seriously crippled, though every effort is being made to give good service. Those who renew during the holiday season, after the Christmas rush and before the big subscription rush in January will be helping to make an even distribution of the heavy burdens on the postal department. Remember that The Wisconsin Farmer, despite the advance in costs in production, is making special offer of three years for $1.50 and, as we have said before, we have no means at this time of knowing whether conditions will be such that this same offer can be made next year or not. The Wisconsin Farmer is adding each year to the service given to its subscribers and those who renew early will not only be helping the men who work in the postoffice department, but will also be extending a special favor to the publisher. Here's hoping that every subscriber may have a happy and prosperous year in 1918.

Worms may be killed in jars of potted plants by taking a dozen horse-chestnuts and pouring over them two quarts of hot water. Let stand overnight and with this water thoroughly saturate the earth in the jars. It will not injure the plants, but the worms will be dead in a few hours.

A little soda added to the bluing water will prevent the bluing from streaking or spotting the clothes. Salt will have the same effect.

Food in the mouths of our allies is ammunition no less important than the shells in their siege guns.

Your Next SILO

Before you build it, send for illustrated description of this new and improved storm proof construction. Seven five-eighths inch steel anchor rods (not cables) hold silo securely braced solid as a rock. The new improved Beaver Silo is made of selected coast fir, strong and close grained. Double angle irons forming inner hoops held tight to outer hoops by hook bolts, so that entire silo stands firmly anchored against any possible shock or stress. Compensating lugs with coiled steel springs allow for swelling or shrinking. Thousands in use in Wisconsin.

Tear out this advertisement write your name and address on the margin, and mail to us for illustrated description, also valuable tables which tell you how big a silo you need for your stock and acreage.

Reliable agents wanted.

417 High St. Beaver Dam, Wis.

IN AND AROUND WISCONSIN

John Haugh, who resides near River Falls, on December 6th loaded forty April and May pigs averaging 218 pounds each or a total of 8,720 pounds. He received $1,484.10 for the load. Mr. Haugh fattened these pigs on 1917 corn, which was not the best, but the deal turned out very well for him.

A series of conferences of Wisconsin honey producers are being held in the state. The places and dates of those yet to be held are as follows:

Greenville, Dec. 28; Antigo, Dec. 29; Shawano, Dec. 31; Wausau, Jan. 2; Grand Rapids, Jan. 3; Mauston, Jan. 4; Kilbourn, Jan. 5; Monroe, Jan. 7; Darlington, Jan. 8; Mineral Point, Jan. 9; Lancaster, Jan. 10; Prairie du Chien, Jan. 11; Richland Center, Jan. 13; Lodi, Jan. 14; Baraboo, Jan. 15; Reedsburg, Jan. 16; Union Center, Jan. 17; Tomah, Jan. 18; Black River Falls, Jan. 19; Augusta and Fall Creek, Jan. 21; Eau Claire, Jan. 22; Chippewa Falls, Jan. 23; Glenwood and Emerald, Jan. 24; Menomonie, Jan. 25; Spring Valley and Baldwin, Jan. 26; Elsworth and Beldenville, Jan. 28, and River Falls, Jan. 29.

Fed on beef scraps and only such grain as the ordinary Wisconsin farm affords in abundance, extraordinary laying records are being made in the poultry flocks maintained at the agricultural station farm. The station pullets seem to realize that the nation is at war and, although they were in the shell themselves less than a year ago, have already produced a remarkable number of eggs, with which to help out on meatless days. One lot of thirteen had laid a total of 642 eggs up to December 1st. Individually they have laid from forty to sixty eggs apiece. Figured at 60 cents a dozen, which is the current price at which they are being sold, these pullets have produced an average of $2.46 each. Last fall birds of the same size and weight were sold at about $1.50 each, showing how much more good layers are worth as producers of eggs than of meat. One pullet in the lot has laid seventy eggs, which performance has been carefully noted and chickens hatched from eggs laid by this bird will be used for the establishment of flocks. This wonder-layer laid her first egg at 150 days old. She was but eight months old when her seventieth egg was laid.

Mr. C. P. Bull, of University Farm, St. Paul, Minn., urges farmers to save enough roots to be set out in their garden next spring in order to raise seed for the following year. Mr. Bull advises this same procedure in order to increase stock of seed of carrots, turnips, parsnips and beets. In saving roots for seed-raising the top or crown should not be injured. A dozen roots will yield enough seed for the average garden.

Following are the dates for remaining farmers' institutes in Wisconsin:

Jan. 15-16 — Muscoda, Chaseburg, Cashton, Elroy, Petersburg and Rockland.

Jan. 17-18—Sabin, Coon Valley, Viroqua, Norwalk, Mt. Sterling and Durand.

Jan. 22-23—Woodford, Mt. Vernon, Highland, Fayette, Browntown and Strong's Prairie.

Jan. 31-Feb. 1—Raymond Center, North Freedom, Valley, Reedsville, Mt. Horeb and Mt. Morris.

Feb. 12-13—Footville, Drafton, Lyons, Lomira, Prairie du Sac and Spring Green.

Feb. 14-15—Rock Prairie, Knellsville, Fredonia, Allenton, Sun Prairie and New Lisbon.

Feb. 19-20—Costburg, Rockdale, Cascade, Omro, Ring, Wautoma.

Feb. 21-22—Collins, Marshall, Random Lake, Brandon, Van Dyne and Coddington.

Feb. 26-27—Mishicot, Rhine, Chilton, Greenleaf, Lake Michal's school and Princeton.

Feb. 28-March 1—Kellnersville, Johnsonville, New Holstein, Wayside, Symco and Pine River.

March 5-6—Rosholt, Reesville, Seymour, Stephensville, Tilleda and Delton.

March 7-8—Bear Creek, De Pere, New Franken, Brussels, Shawano and Oxford.

The first farmers' institute meetings following the Christmas vacation will be held January 8th to 11th, inclusive, at Haugen, Ettrick, Lindsey, Blair, Holcomb, Humbird, Colfax, Disco, Cherokee, Alma Center, Bloomer and City Point.

The annual farmers' course at Madison will be held during the week of February 4th to 9th, at which time important conferences of stockmen, grain growers and drainage officials will be held.

The Wisconsin Farmer has always advised its readers to attend the farmers' institutes. The work is more important this year than ever. Watch your local paper for detailed announcement.

The executive committee of the Wisconsin Potato Growers' Association met with the director of the Milwaukee Association of Commerce on Friday, December 14th. Arrangements were made for holding next year's convention and state potato show in the Milwaukee Auditorium, November 17-22, 1918. Milwaukee interests are very enthusiastic over the plan to hold the State Potato Show annually in Milwaukee. The Milwaukee Association of Commerce and the board of directors of the Auditorium have offered the best of coöperation and support to the Wisconsin Potato Growers' Association. A conference of representatives state interests will meet with the Milwaukee Association of Commerce at Milwaukee in March to perfect the necessary organization of committees for the convention.

Mr. John L. Tormey, of Madison, one of the officials of the Wisconsin Short-horn Breeders' Association, says it is better to eat the veal from an unpromising calf than to eat the beef and wear the leather from a poor steer, which has wasted human food all his life. We quote from Mr. Tormey:

I agree that there is more meat on the thousand-pound animal than there is on the veal calf. I also agree that we need the meat, but it would be well to consider if there would not be greater waste of effort, money and human food if we kept all of our cattle up to the weight of 1,000 pounds, than if we ate a few of the calves for veal. Many fanatics have in mind the passing of laws to prohibit the slaughtering of calves and from many sources a cry is raised about the farmer who sells the calves. Why not pass the buck along and condemn the packer, who is uncouth enough to kill them and the consumer, who is canabilistic enough to eat them.

Experience has demonstrated that the calf raised on high-price land can better be made into a 1,000-pound baby beef than kept longer principally, because the young animal is a better conserver of feed. The older the animal becomes, the more costly the gains, because it takes more feed to make the same amount of human food.

This is the answer by a very competent authority to the much discussed veal question.

The second annual corn meeting and show was recently held under the auspices of the agricultural division of the Edgerton High School. Walter L. Houser, representing the Wisconsin Live Stock Breeders' Association, spoke on the business of pure-bred stock raising and gave special emphasis to Wisconsin baby beef contests. There were also addresses by A. J. Glover, of Fort Atkinson, and L. A. Markham, county agricultural agent of Rock county. Obin Lien won the acre corn-growing contest and a prize of $15 offered for the same. He raised 103 bushels of corn to the acre, which is not the best that had ever been done in Rock county, but which was very good for the season 1917. Martin Rucks won the one-fourth-acre potato-growing contest and the $10 prize for the same. He produced fifty-three bushels on one-quarter of an acre.

Six of the Shires from the R. Connor farm, Wood county, Wisconsin, carried away eight prizes, four seconds, one third, one fifth and two sixths at the International Live Stock Show in Chicago. One of the seconds went to Dray King Fashion, the animal which won grand championship of Shires at the 1917 Iowa State Fair.

Big-Type Polands Won Him Success.

(Continued from page 1.)

are now about seventy head of pure-bred Holsteins in the herd. The senior herd sire is a son of King Segis Polkadot and the junior sire is a thirty-three-pound bull recently purchased. Mr. McDonald started his dairy work, as he does all other things, on a conservative basis. He purchased some of the older, tried cows at the sales held around the state and the offspring of these cows was not a matter of unknown quality, for he knew by the former offspring of the animals what kind of calves to expect. He has made a success of his dairy work for this reason and had no losses from unfortunate purchases. With the ideal location of the West Salem farm Mr. McDonald will do more advance registry work and develop his herd to the highest possible degree.

The picture of the barns reproduced on the cover page shows a round barn which was on the place when Mr. McDonald bought the farm. The barn is 172 feet across and is large enough to winter a circus and all attendants. In the center is a silo forty feet across and around it are the stanchions for the dairy cows. The outer circle was formerly used as a feed shed where the cows were turned in after milking and received their hay rations.

Show Herd of Sows Taken Six Weeks After Return From 1917 Show Circuit.

While the arrangement might be considered ideal from the standpoint of cow and man comfort, since the stock must not be driven from the cold barnyard into the barn, it is a most unsanitary arrangement. Mr. McDonald intends to build a modern, sanitary barn and he has already figured the cost of erecting a new building with plenty of light and ventilation and modern equipment. There is enough lumber in this monster round barn to build a dairy barn 100x38 feet and all necessary outbuildings on the farm besides.

A hog house which was on the place when the farm was bought, also does not suit Mr. McDonald from the standpoint of light and arrangement. However, all things cannot be made ideal in the short time one would like to have them so, but another year or two will probably see an entire new set of buildings on the farm, built with a view towards comfort for animals and man, but including light, ventilation and sanitary equipment. Meanwhile hogs and cows will continue to increase in numbers and quality.

Showing a Few 800-Pound Sows Taken After Weaning Pigs.

FARM EXPERIENCES

Growing Seed Corn.

To the Editor:—I will try to outline my system of growing seed corn. To begin with, I begin my corn crop the year before I plant my corn if I intend to plant on oat stubble. I seed all my grain to clover or alfalfa every year. If it fails, I manure it heavy during the winter and then plow for corn in the spring. Should I find I have too much clover for hay, I manure the clover, and plow both under. If I decide to break any sod I manure it and if possible I try to plow same in the fall. In the spring the ground is disked and re-disked and harrowed until it is as mellow as a garden. As early as possible I plant with a two-horse planter in hills, three to four kernels to a hill. Before my corn is planted I ear test every ear, taking six kernels out of every ear. If all six kernels do not show a strong sprout that ear is discarded. This gives me a 100 per cent stand. I have never had to replant a field of corn in the five years I have owned my farm. Have also never had a field destroyed by cutworms. Timothy fields are usually infected with cutworms in certain years. I am not a believer in timothy very much. Clover and alfalfa for me.

I usually do not stop until freezing is gone by in the spring. I would rather have my corn freeze in the spring than in the fall. I have had corn come out of the ground and freeze off, grow up again and produce a good crop of mature corn. I had the same experience this spring. Corn froze off, but in the fall I had a fine crop of mature corn ready to go nearly every ear into the seed house. When my corn is planted the ground is harrowed as often as convenient two or three times to keep weeds down and conserve moisture. Have also harrowed it when corn was all up on a hot day. When corn is high enough, about two or three inches, I begin to cultivate. First cultivation as deep as possible and every successive cultivation being shallower than the one preceding. I also go through my field with the hoe. I continue to cultivate until too big to get through.

On the last 4th of July I had Golden Glow corn over knee high. As soon as ripe I begin to cut in shocks. This year I built a silo, so I husked some of my corn from the standing stalks and then cut the stalks into the silo. The seed is at once taken to my seed house as soon as husked and put on a slatted floor. Some is hung up on hangers and strings. As long as it is not too cold no fire is started. When corn is getting too thick on floor fire is started in the stove and every window opened on dry, windy days to carry off the moisture. I have found by experience that a fire without ventilation is absolutely worse than no fire at all when a large quantity is dried in a tight building. I have never failed to get a ripe crop of corn. This year I had a fine piece of mature Golden Glow corn. Have had also a piece of King Phillip flint corn which was ripe in September. This corn is very early and productive. I also grow Silver King and Murdock. My Murdock was nearly all ripe. The snow caught some of my Silver King, but managed to get some for seed before the snow. I have my seed house 16x26 completely filled with good, choice seed as could be grown this year, so will be able to fill many a farmer's needs. Every year corn is picked as early as possible which hastens maturity a few days every year, so corn can't help but get ripe before killing frost under favorable weather and working conditions. Arthur O. Popp.

Jefferson Co., Wisconsin.

Getting Heavy Yield of Potatoes.

To the Editor:—I will write you a few words regarding my experience in growing potatoes in northern Marinette county. I am located on hardwood land of the rolling character, but have had good results in growing potatoes and the way I prepare my land is as follows: I top dress my spring seeding clover fields with barnyard manure during the following fall and winter. I cut the clover for hay the following summer, plow the second crop under, using a jointer on my plow so as to turn everything under in the last part of August or first part of September. Then I manage to disk a couple of times before winter. The following spring as soon as the ground is dry enough to be worked I double disk it once more, then continue with a spring-tooth drag twice a week till planting time which is around May 25th. Now another important fact is to obtain good seed free from disease and true to shape of a standard variety, such as the Rural New Yorkers, Green Mountain, Triumphs and Irish Cobbler. The two latter ones are early variety.

I am very careful when cutting my seeds, making blocky pieces with no less than two eyes. For planting I use a hand planter which I think is the best for anyone who does not grow more than three or four acres a year. I plant in rows thirty-six inches apart and fifteen inches in the row, as I don't believe in growing these big, coarse, rough, hollow tubers. When I am through planting I continue dragging very lightly with a peg-tooth drag at least twice a week till the potatoes appear out of the ground. Then as soon as they are high enough to see the rows I give them a good, deep cultivation and keep on at least once a week or after every heavy rain, although I am very careful not to cultivate too late. When the vines get about twelve inches high I dig with my hand right in the middle of the rows two or three inches deep. If I find some of these fine, white roots, I rather leave them alone or cultivate very shallow. I never use a shovel plow, but ridge them a little with the cultivator.

I am very sure that anybody who will follow this method will grow a good crop of potatoes and no weeds. However, I am very careful in selecting my seed, making a hill selection every year, which is very important. Up to this time I have never treated my seeds yet and my potatoes are free of scabs and no other disease in them whatever. It's no trick to grow from 250 to 300 bushels per acre by these rules. Fabien Lardinois.

Marinette Co., Wisconsin.

Depth of Potato Planting.

To the Editor:—I am sending you today a picture of my daughter standing in my field of Green Mountain potatoes. This picture was taken while the field was in second bloom and it was surely a fine sight. I can't tell you exactly what the yield was, but our county agent visited the field two or three times du ing digging season and he gave it as his opinion that it would make about 300 bushels per acre in spite of the early freeze. I am especially interested in community growing and standardizing of potatoes, although I am a beginner in this work. I find there is a great deal to learn and it is difficult to lay down set rules for planting and cultivating. However, I believe I can get results by planting the rows about thirty inches apart and eighteen inches apart in the row.

I would like to ask if planting the seed quite deep will make the potatoes set deeper in the ground or does the planting have anything to do with it? J. A. Andress.

Rusk Co., Wisconsin.

[The character of the soil to some extent determines the depth of planting. Experiments conducted for seven years at one of the Canadian stations indicated that the best results were obtained by planting from three to five inches deep. Not only was the yield less where potatoes were planted shallower than three inches, but there was a larger percentage of sunburned potatoes from the shallow planting. At that station where potatoes were planted only one inch deep the yield was satisfactory, but it was found that over 30 per cent of the potatoes were sunburned while, on the other hand, only 4 per cent were sunburned from three-inch planting, and from deeper plantings there was no injury whatever on account of potatoes being exposed to the sun.—Editor.]

Field of Green Mountain Potatoes in Second Bloom, on J. A. Andress Farm, Rusk County, Wisconsin.

Commercial Fertilizer.

To the Editor:—We have used considerable commercial fertilizer during the past year and previous year and are well satisfied that it pays us. When our men put this in the first year they were skeptical as to the wisdom of the extra investment, but now they are converted to the idea and insist upon it. On our potato farm we have had two very dry seasons—a drouth this year of over four weeks at setting time and last year much worse. We had planted chiefly Triumphs and, while the yields were very much reduced, we find that the fertilized potatoes ran to a much nicer seed type than the others which had grown uneven. At our garden we had even rain conditions and a very good yield of over 275 bushels to the acre, chiefly Rurals. The check rows where no fertilizer was used clearly showed at digging time. We are going to use commercial fertilizer again next year at least to some extent and will say that we no longer consider it an experiment. Eldred Klauser.

Oconto Co., Wisconsin.

Ditch Yourself Rich

All over the country—in every county and town, almost on every farm—there is wet, soggy land that needs underdrainage to be at all profitable.

Owners are ready and waiting to have this ditching done by Buckeye Traction Ditchers and will pay *good prices* for contract work.

Why not take this up? You can make it a between-times job or a year round business. Either way it will pay you big. Some ditcher men clear $10 a day *and up,* depending of course on circumstances; but anyway you look at it, the business is a gold mine.

Here is a letter from Mr. H. W. Sherrard, of Twelve Mile, Ind., who cleared $97.96 a day. Sounds good, doesn't it?

"With my No. 1 14½-inch-cut machine my helper and I put in 157 rods of tile in one day, of which 112 rods were for 12-inch tile averaging 48 inches in depth, bringing me 72 cents per rod, and 42 rods of 6-inch tile averaging 38½ inches in depth, bringing 38½ cents per rod—making a total of $97.96 in a single day. I challenge anyone to beat it with a No. 1 machine."

The Buckeye is a *complete* machine. Cuts 100 rods of perfect trench true to grade and ready for the tile every full day. Gasoline or kerosene power, easily managed by one man and not at all liable to breakage.

Our Service Department will coach you about details and help you to get started. Write for "Dollars In Ditches"—a book of facts; mighty interesting reading if *you're* interested.

The Buckeye Traction Ditcher Co., 1721 Crystal Ave. Findlay, Ohio

One Man Alone Pulls Biggest STUMPS

Quickest! Cheapest! Best!

$50 and Up

Kirstin One-Man Stump Puller instantly gives you a GIANT'S POWER—makes you master of any stump! Many Kirstin owners pull stubborn est stumps in 4 to 10 minutes! — AS CHEAP as 5 CENTS per stump!

Kirstin

Just a few pounds on the handle means tons on the stump. When stump starts, throw machine into high speed and out comes the biggest stump, roots and all. Positively no other machine like it. Has special, patented features. Recommended by leading Agricultural Schools and Forestry Bureaus.

Why have stumps when you can now pull them so easily, quickly and cheaply?

Amazing Offer To prove these claims, we will ship you any size or style Kirstin on THIRTY DAYS' FREE TRIAL—not one penny in advance. Return it if not pleased. If pleased, pay low price in small monthly payments. Kirstin Pullers as low as $50. One-man style or HORSE POWER—all sizes. Three year guarantee with each machine.

Write! Don't endure stumps any longer. Send postal now for most valuable Stump Puller Book ever published—pictures—prices—terms—letters from Kirstin users and all about our Special Agent's Proposition—all Free. Write!

National Short-horn Congress.

Show and Sale to Be Held in International Live Stock Amphitheater, Chicago, February 18 to 23, 1918.

A MOVEMENT of unusual importance as applied to the live stock interests of the United States has been put on foot by the American Short-horn Breeders' Association. It will be nothing more nor less than a national Short-horn congress, show and sale which will be held at the Union Stockyards, Chicago, February 18 to 23, 1918. There will be 125 bulls, varying in age from twelve months to three years, entered, and 200 females. A special classification prize list has been provided for milking Short-horns, the details of which will be announced later by the Milking Short-horn Club of America. An accurate idea as to the exact character of this show and sale will be obtained from the program, of which we now propose to give a summary.

Beginning at 10 o'clock on Monday, February 18th, two of the older classes of Short-horn bulls will be judged. There will be fifteen prizes in each class, the first five prizes amounting to $40 each, the next five $35 each and the third five $30 each. At 11 o'clock on the same date two classes of younger bulls will be judged and in each class fifteen cash prizes similar to the above will be given. At 1:30 p. m. on the same date the judging of the two older female classes will begin, the first including cows with calves at side or in calf, and the second the oldest heifer class. Twenty prizes will be given on the first classification and a similar number on the second. The prizes will range from $35 down to $20. At 2:30 p. m., February 18th, the two younger female classes will be judged and there will be twenty prizes awarded in each class, ranging from $35 down to $20. At 3:30 p. m. the groups and championships will be judged and at 6:30 p. m. on the same day a banquet will be held and an important program carried out. In addition, there will be a picture film shown reproducing the Short-horns at the recent International Exposition.

On Tuesday, February 19th, the auction sale will begin and will continue until noon, to be again taken up at 1:30 p. m. In the evening there will be no program. On Wednesday, February 20th, the auction will be continued both forenoon and afternoon and a special program has been prepared for the evening of that day, beginning at 8 o'clock p. m. On Thursday, beginning at 10:30 a. m., the auction will be continued and on that date, forenoon and afternoon, the remaining animals will be sold. At 6:30 p. m. on Thursday the Milking Short-horn Club of America will hold a banquet and carry out an interesting and important program. On Friday, February 22d, the milking Short-horns will be judged and in the afternoon of that day they will be sold at auction.

Sec. F. W. Harding, of the American Short-horn Breeders' Association, calls special attention to the fact that every person attending this congress will be furnished a member's badge, and, if desired, a ticket to dinner and entertainment that is part of the Monday evening program, this being furnished at a nominal cost per plate. Mr. Harding says that it is very important that all visitors call at the American Short-horn Breeders' Association bureau in the lobby of the Stockyards Inn on their arrival.

This is indeed a history-making event and we believe that it is only necessary to call attention to it in order to attract the attention of a great many readers of The Wisconsin Farmer. The affairs of the American Short-horn Breeders' Association are in the hands of progressive men and the zeal they are showing in the advancement of the best interests of the breed is but commensurate with the urgent need that exists for the introduction of more good Short-horn blood into the herds of America.

State Inspects Vegetable Seeds.

What the New Wisconsin Laws Provide---By A. L. Stone, State Inspector Wisconsin Department of Agriculture.

THE scope of work and functions of the Wisconsin State Department of Agriculture were greatly broadened and extended by the legislature of 1917. Several lines of regulatory activities heretofore conducted by the experiment station were transferred to the state department. Among these was the inspection of agricultural seeds under the state seed inspection law. Under the law in question the inspection of field crop seeds only has been required.

The legislature of 1917 so amended the law as to extend certain of its restrictions to the sale or offer for sale of vegetable seeds. As applied to crop seeds, the law provides that no package of agricultural seeds exceeding one pound in weight shall be sold, or offered for sale, within the state for seeding purposes unless the same when put up in either open or closed packages shall have attached thereto a label upon which is plainly printed or written in the English language the following:

1. Name and kind of seed.
2. Name of seller, dealer or agent.
3. Purity of the seed.
4. Germination test.
5. Place where grown if the seed is corn, small grains or alfalfa.

Vegetable seeds almost never contain noxious or other weed seeds, and mixtures of the seeds of varieties is almost impossible to detect, so no purity test on vegetable seeds is required. Farmers seldom find fault with the purity of vegetable seeds, but often complain because the seeds fail to grow well. Certain seedsmen who do a package vegetable seed business have been accused of retaining seeds from unsold packages, to mix with new seeds in filling packets for the next year's sales. If the seed is not too old, this practice is perfectly legitimate with certain kinds of seeds which retain their vitality for several years. With certain other varieties the practice is reprehensible and almost certain to result in the entire loss of the crop, or at least a partial loss through delay caused by the necessity of replanting.

Under the amended law, packages of vegetable seeds, irrespective of size or weight, must be labeled with the germination test if it falls more than 5 per cent below the standard of germination for such seed fixed by the state department of agriculture. These standards are carefully being worked out by the state department and will be published in the near future. It is easily possible to set standards so high that no seedsman can do business under them without rendering himself liable, and also higher than is necessary for adequate protection to the growers. This is emphatically true this year because both last year and this growing and harvesting conditions have been so unfavorable as to make the production of vegetable seeds of high vitality almost impossible.

The Wisconsin Department of Agriculture is "empowered to fix standards from time to time" and in years when the conditions are favorable for the production of vegetable seeds of high vitality, the standards of germination will be raised accordingly.

Vegetable seeds are usually sown or planted much more thickly than necessary, on the supposition that much of the seed will not grow. This is a wasteful proceeding, and in a year like this when vegetable seeds are scarce, only enough seed to produce a satisfactory stand should be sown. The standards of germination to be fixed by the department og agriculture may seem low, but if the germination test does not fall below the standard as fixed for any kind of seed, it may be expected to give satisfactory results. There has been no surplus of vegetable seed held over from the preceding year as is usually the case, and because of the short supply, much seed of comparatively low vitality must be used.

UPPER WISCONSIN

Work of Mr. Juday.

A good idea of the faithful and profitable work of an Upper Wisconsin county agent may be gathered from the report recently filed with the county board of Oneida by Mr. W. D. Juday, county agricultural agent of that county. The following items are taken from this report:

Since November, 1916, I have made 549 farm visits and have visited 292 different farms. There have been 1,085 office and telephone calls and 3,214 letters have been written. I have given forty-six talks at farmers' meetings attended by 2,540 people.

The results of the potato development work carried on the past four years stand out as the most prominent feature. The past season has not been the most favorable for a large potato crop, but our average yield has been larger and the quality better than it has been for years. Our table stock has topped the market and many carloads sold at a premium. We have an abundance of certified seed stock again this year, a few cars of which have already been sold at 25 and 40 cents in advance of the regular price. Last spring hundreds of bushels of certified seed sold for $3.50 per bushel and some sold for as high as $4. During the past year Oneida county again won first honors at the state potato show and at the state fair. The advertising these winnings give has meant dollars in our farmers' pockets and has also been a stimulus in getting new settlers here. Right now potato growing is the most profitable line of farming one can engage in and we should make the best of this situation by planting as many potatoes as we can properly take care of. Plant them on the best soil, care for them well and don't be afraid to use a little commercial fertilizer and Bordeaux mixture. Both paid well this year.

Next in importance is the dairy work. Early last spring a campaign was started to ascertain the number of tubercular milk cows in different herds of the country. Twenty-one herds were tested with a total of 250 cows. Six cows reacted making the percentage of tubercular animals in the herds tested about 2½. In the central part of the state about 7 per cent of all dairy cows are tubercular and in the southern part about 14 per cent. This emphasizes the necessity of keeping our herds free of this disease and we can do so only by regularly testing our herds. This work will be continued again next year.

Twenty-six pure-bred dairy animals, fifteen females and eleven males, were brought into the county this year through the help of the county agent. Several pure-bred herds are being established in the county and some day Oneida county will be known for her high producing dairy cattle as well as by her high-class potatoes.

We have also made an effort this year to rid the farmer's herd of his boarder cows. The high-priced feeds fed to a poor cow mean a big loss to the owner. With the high price of milk and butter fat one can feed grain to a good cow at a nice profit.

The third important work was done with the improvement of grain. Winter rye was urged strongly for new land. It is without doubt the surest and most profitable grain crop for the average soil of the county. The acreage for both winter and spring wheat has also increased. Owing to the fact that barley has not done well on sandy soils its acreage has remained about the same. Much work has been done with one treatment of grains with formaldehyde to prevent smut. This treatment is simple, costs about 2 cents an acre and saves on an average of $4 per acre to the farmer. No farmer ought to sow grain without first treating the seed with formaldehyde.

For eighteen weeks I taught agriculture in the training school. This work is important, for were it not for this training most rural school-teachers would begin their teaching career without the slightest idea of the fundamental principles of farming and thus have little or no sympathy for the farmer's real need.

Many other lines of work have also been taken up. Twelve and a half tons of spray material were sold to the farmers at a saving to them of over $3,000. Five carloads of feed were handled at a saving of about $750 and five cars of fertilizer at a saving of about $900. Some of the other problems worked out are figuring balanced rations, planting crop rotations, planning buildings, helping farmers select better varieties of grain and other seeds, advising concerning better cultural practices for all crops.

It is the business of the county agent to call on every farmer who asks for his services and then so far as possible visit other farmers in the county. But the territory is large and the visiting time limited. For this reason any farmer wishing the services of the agricultural agent should feel free to call upon him or write him at any time. Every farmer will be given prompt attention and each call taken care for in the regular order.

The ultimate object of this work is to make Oneida county a more desirable place in which to live both in a financial and social way and any help toward the furtherance of this cause will always be appreciated.

What a fine statement this is. There are many counties in the state of Wisconsin where regular county agents are not now employed which would do well to investigate the system.

Another Farm Loan Organization.

Mr. G. M. Householder, county agent of Hawkins, Rusk county, Wisconsin, has assisted in organizing the Hawkins National Farm Loan Association. Twenty members have signed the articles of incorporation and subscribed $20,000 in loans. Further applications are received.

Calumet County Guernsey Breeders.

To the Editor:—The Calumet County Guernsey Breeders' Association held a successful meeting Saturday at Chilton in spite of the cold weather. Professor Benkendorf, of the dairy department, discussed in detail: The government has established a minimum price of $15.50 on hogs, which equals thirteen times the price of corn; the tremendous market for dairy cows created by war conditions; farmers are justified in raising all good daily heifer calves; skim milk is worth 75 cents per hundred to veal calves and $1 for egg production; and that whole milk, in comparison with other foods, is cheap at 15 cents a quart. Whey is worth one-half as much as skim milk.

Math. Michels, president of Wisconsin Dairymen's Association, a successful and practical Guernsey breeder, of Peebles: "Almost invariably a pure-bred bull increases the value of herds, whether Guernsey or Holstein. Our cows at home receive twenty to thirty pounds of silage and all the best alfalfa, fed several times daily, the cows can consume. The stems are fed to the horses.

"One of the most important essentials of good farm management is a system of farm accounts. The modern business men find it an impossibility to survive without an exact accounting system. Every department must pay for itself, every employe must earn his salary, and so it must be on the farm. Every cow must earn a net income on a profit above her feed cost —she is one of the hired men. And so it is with all the departments on the farm."

Herman J. Duecker gave a very instructive talk on his system of handling his high record cows. He feeds from three to four pounds to every pound of butter fat produced by cow per week from mixture of: 600 pounds bran, 300 pounds oats, 100 pounds oil meal. He feeds his calves from four to ten pounds of whole milk daily, then gradually adds a little warm water and some oil meal jelly. They receive a little milk until they are six months old. As soon as they will eat grain they get what they will clean up after milk from a mixture of ground oats, bran and oil meal, equal parts.

Several other interesting talks created a lively discussion.

It was unanimously decided that members of the Guernsey association should each keep farm accounts in cooperation with Prof. D. H. Otis, farm management expert at Madison. Thirteen members will start in January.

It was also decided unanimously that members of the association who had a boy or girl under nineteen years of age should enter a pure-bred calf in the school fair in November, 1918. Three members started.

Six new members were accepted.

It was decided to hold a barn meeting at the farm of Herman J. Duecker as soon as possible, and that such meetings should be held often and scattered over the county.

Royal Klofanda,
Agricultural Demonstration Agent.

Oconomowoc Poultry Show

That there is a growing interest in the poultry business around Oconomowoc was evidenced by the five-day show of the Oconomowoc Poultry and Pet Stock Association last week. This was the thirteenth annual show and there were about five other birds in addition to pigeons, ducks and geese. W. E. Stanfield, of Hillsdale, Michigan, was judge. Following an address by D. H. Otis, of the Wisconsin College of Agriculture, a movement was launched to organize the Oconomowoc Farm Management Club. The purpose is to put the farms of the territory surrounding Oconomowoc on a business bais not only with reference to poultry, but also along other lines of farm activities.

Stump Pullers pull all the stumps at less cost and do away with the mean hard work usually connected with land clearing. Single, double, triple power. Develops 135 h.p. Free trial. Ironclad guarantee. Write today for catalogue No. E and special introductory offer.
La Plant-Choate Mfg. Co.
767 Eastlack Ct. Cedar Rapids, Ia.

Have You Any Beans?
WE ARE BUYERS, for cash, of white, red kidney, brown or Swedish and Boston yellow eye beans, fancy, bright, clean stock. Also wax and green-podded garden beans. Send samples for bid.

What 15c Will Bring You from the Nation's Capital
Washington, the home of the Pathfinder, is the nerve-center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.
The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 25th year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us; we are glad to invest in new friends.
THE PATHFINDER, Box 70, Washington, D. C.

Grinds a Wagon Load for 15 cents

In these days of high priced gasoline, economy in grinding is of the utmost importance. Do not waste your time and money grinding feed with an out of date buhr mill. Cut your grinding bills in half and put money in your pocket by using one of the
HOWELL *Roller Feed Mills*
that will grind twice as fast with the same power as the best buhr mill made. Have corrugated steel rollers, same as used in modern flour mills. No parts to wear out. Built to last a lifetime. Fully guaranteed. The only mill that gets the wild oats. *Made in 13 sizes—any capacity—a size for any engine.*
FREE—Complete catalog and the Famous Roller Mill Puzzle. Write for them today.
R. R. HOWELL CO., 8 Malcolm Ave. S.E., Minneapolis, Minn.

POULTRY

THIS department is edited by a competent poultryman, who will be pleased to answer questions concerning diseases, poultry management, etc., when they can be answered through the department. Questions will not, however, as a rule, be answered by mail, and stamps need not, therefore, be inclosed with inquiries. Address all letters relating to poultry topics to this office.

Wisconsin Poultry Show.

Of the three important specialty club sessions and shows which will grace the doings of the Wisconsin State Poultry Association's annual meeting at Madison, January 7th-11th, those of the Barred Plymouth Rock are apparently attracting the most attention just now.

"This is true because the Barred Rock has long been a general favorite with farmers—it is perhaps the widest known utility fowl at present in Wisconsin," said J. G. Halpin, secretary of the Wisconsin Poultry Association,

The White Plymouth Rock Club and the Buff Wyandotte Club will also hold state meetings of enthusiasts during the show. Both the White Rock and the Buff Wyandotte are in particular favor with farmers as well as fanciers and a great display of these breeds is anticipated.

Members of the Wisconsin Poultry Association who will cheer for these respective breeds in the respective conventions scheduled for the week are:

Barred Plymouth Rocks.—Ives Roberts, Ft. Atkinson; George Hackett, North Freedom; W. A. Belda, De Forest; A. F. Roske, Windsor; D. D. Culham, Stoughton; J. F. Johns, Dodgeville; H. H. Paulsen, Marshfield; Wm. Davenport, Stoughton; L. L. Hare, Monroe; C. H. Alsmeyer, Cottage Grove.

White Rocks.—J. J. Flad, Madison; H. W. Halbach, Watertown; H. H. Paulsen, Marshfield; Wm. Hoffman, Jr., Middleton; F. J. Holt, Sun Prairie; Sylvanus Ames, Stoughton; E. V. Sorley, Tigerton.

Buff Wyandottes.—J. R. Love, Waukesha; Gladys Poultry Yards, Stevens Point; T. L. Clayton, Dodgeville; E. S. Conry, Sun Prairie; F. L. Johns, Platteville; C. H. Oliver, Cambridge.

Handling Poultry During the Winter Months.

To the Editor:—The problem of keeping poultry during the winter months is one which is most annoying and indeed one of the hardest to solve among breeders and exhibitors. The chief thing, however, is to have the birds go into winter quarters in good condition. The houses should be comfortable in such climate as has Wisconsin, although the scratching shed should be so ventilated that plenty of fresh air can circulate throughout.

Just now the feed problem is most difficult, but if the poultry raiser will use good judgment and take a little extra time, the same results can be obtained from feeds which at present are quite reasonable. To the city poultry raiser, I would say that grit, oyster shell or beef scrap should be kept before the hens all the time if eggs are wanted during the winter months. To the poultry raiser of the farm other substitutes can be used to advantage. For instance, if a load of sharp sand is placed in the scratching shed the results are practically the same.

The city poultry man, of course, has to depend almost wholly upon commercial feed. Therefore, it would behoove him to buy such feeds as bran, oats, barley and middlings. Oats, however, should not be fed alone, as fowls will not fatten on it, nor should it be fed dry. It must be soaked or in a wet mash of bran if any results at all are expected.

Then, too, if you want the hens to "shell out" there is nothing like bones boiled down and the liquid substance thickened with bran, middlings or ground oats. Water is indeed essential for egg production and should be kept fresh before the birds. This forcing the hens to lay is not the best policy for breeding purposes. However, this in closing, I should not forget to mention that it is the clean poultry house and yard that gives the best results and if a little caution and care are taken we can make Wisconsin the banner state for poultry of profit, pleasure and show. Olive M. Hoyt.

Walworth Co., Wisconsin.

Finds Duck Raising Profitable.

To the Editor:—I will tell of my experience in raising ducks, as I raise from 200 to 350 a year, besides chickens and geese, and I find ducks the most profitable of the three. They consume more feed, but grow much faster than chickens, are excellent layers and are not bothered with lice.

I usually sell all the duck eggs while there is a good demand for them for setting purposes. The hatching season usually lasts from the middle of March until the middle of June. After the demand for eggs slackens up I set my incubator and all the hens I can at the same time, as ducklings of different ages should not be allowed to run together, for they grow very fast and are so clumsy they trample the small ones to death. The ducklings hatched in incubators are just as strong and grow just as fast as those hatched under hens.

About the middle of last July I took off 202 at one time and this fall when it was time to market them I had 191 fine, large ducks. I sold eighty-four of the smallest ones (although they were a very even bunch) on the market and they brought 81 cents each.

I shall keep a flock of about 100 breeders another year, as duck eggs must be fresh to hatch strong, healthy ducklings. I like to hatch them late in the season, as the weather is warm and they do not have to be cooped up as they do earlier in the season, but they should have plenty of shade. An orchard is an excellent place for them, as it also provides a good many insects for them and they need plenty of room to exercise to keep them healthy.

The ducklings, if properly cared for, are very healthy and are not subject to bowel trouble as are little chicks, but they should never be without plenty of clean water to drink and it should be deep enough to put their heads clear under water, as sometimes their nostrils get closed up and they die for want of air.

It will not hurt them to swim in water if the sun is shining and the weather warm. I have had them swim and play in water till they were soaking wet when but a week old, but never lost one from the effect of it, although I never allow them to do this unless it is quite warm. I like water fountains best for them, as they cannot get the water dirty as in open vessels. After they get older I have a barrel with a hog waterer at the side of it. We fill the barrel with water and put it in the shade and they have plenty of clean water all day.

It is very essential that their coops where they stay at night be clean and dry with a little clean straw for bedding. If this is done you will not be bothered with leg weakness.

I have fed ducklings different kinds of feed with the same result. When flour was more plentiful I bought a cheap grade of flour and made bread and soaked it in milk for them the first few days. Their feed can be mixed with water, but they grow much faster for me when I use milk, as I do not have many meat scraps. After they are two weeks old they can be fed a mash of ground oats and corn and bran with a handful of coarse sand mixed with it and should be fed five times a day all they will clean up nicely. Last summer, flour being high, I baked corn bread for them for a few days, always soaking the bread with milk or water and adding a little sand after that. I fed ground corn and oats, omitting the bran, as I thought it too high to feed profitably.

After about the 1st of September they went to the cornfield and picked up all the feed they had till snow came and now I am feeding oats and ear corn, which they shell readily; also potato or apple parings or any waste vegetables. We have always kept plenty of grit and water where they can get it at all times. When it gets near the laying season I shall feed them a mash of ground oats, corn, bran with some meat scraps. They lay much better when fed soft feed than dry feed.

Mrs. J. H. Wintermute.

Trouble With Turkeys.

To the Editor:—Will you please ask the readers of your paper to give us some turkey talks and tell us why it is so hard to raise turkeys? Do not have much trouble with them at first, but when they are about a month old or so I lose most of them. Have been very careful to feed sparingly and put charcoal in feed. I have kept grit before them all the time, and have chopped up onion tops and put in the feed at least once a day. I have given them pure water with a little permanganate of potassium in it part of the time. A Reader.

[Let us hear from some of our readers who are familiar with the ups and downs of the turkey raising business.—The Editor.]

"Raise More Poultry"

Is Our Country's Call. *Now is the time to start—the demand is big—every man, woman, boy and girl can help. Besides supplying the Nation with food, you can make big profits with little effort—and this small investment,*

THE FARMERS' MARKET

WANTED—FOR SALE—TO EXCHANGE

THIS department is to bring the buyer and the seller together. You may want help. You may have live stock, poultry and eggs, or machinery for sale. Maybe you want to sell or to buy a farm. Think how you can advertise now. Write your copy for the advertisement. The rate is six cents per word, each insertion. Note the low cost to reach our 90,000 circulation.

THE WISCONSIN FARMER -:- MADISON, WIS.

SHEEP.

FOR SALE—100 half blood Cotswolds, $17.50 per head. 100 quarter-blood Cotswolds, $15.50 per head. These ewes are western ewes, have been dipped, are in good condition, have good solid mouths, have been bred to black-faced bucks and due to lamb in April. Are heavy shearers and are a very fine lot of breeding ewes. John Blanchard, Columbus, Wis.

FARM LANDS.

GO WHERE LAND IS LOW PRICED—Last year we urged some of our investor friends to purchase certain farm lands in Eastern Oklahoma which were then offered at from $35.00 to $50.00 per acre. Many of these farms in 1917 earned for their owners several times the cost per acre in 1916. We still have a few farms listed for sale at very attractive prices. They are worthy of the consideration of any man who wants to buy a farm. We do not own these lands but with a view to increasing the number of farmers along our railroad, and thereby building up our trade territory, we have interested ourselves in the matter of distributing information in territory where we know there are good farmers, hoping that we can move some of them into eastern Oklahoma. We do not charge anything for our services. We will be well repaid if our territory is built up by the removal thereto of a number of men who know how to farm. If you are interested in a farm in eastern Oklahoma, of the kind referred to above, write me for particulars. R. W. Hockaday, Industrial Commissioner, M., K. & T. Ry., 1505 Railway Exchange Bldg., St. Louis, Mo.

A SMALL CALIFORNIA FARM earns more money with less work. Raise crops you know: alfalfa, wheat, barley; also oranges, grapes, olives, figs. Ideal for dairying, pigs, chickens. No cold weather; rich soil; low prices; easy terms; good roads; schools, churches. Enjoy life here. Write for our San Joaquin Valley, Dairying, Poultry Raising, Illustrated Folders, free. C. L. Seagraves, Industrial Commissioner, Santa Fe Ry., 1959 Railway Exchange, Chicago.

LANDOLOGY, a magazine giving the facts in regard to the land situation. Three months' subscription FREE. If for a home or as an investment you are thinking of buying good farm lands, simply write me a letter and say, "Mail me LANDOLOGY and all particulars FREE." Address Editor, Landology, Skidmore Land Co., 310 Skidmore Bldg., Marinette, Wis.

OKLAHOMA FARM LANDS FOR SALE—Good farm lands for sale at prices ranging from $15 to $40 per acre. Some of this land underlaid with coal, oil and gas or other minerals. Fine climate, good seasons and best of citizenship. Write R. E. Lynch, Tulsa, Okla.

80 ACRES—65 under cultivation, 2½ miles from town, brick house with furnace, big barns, machine sheds, hog house, hen house, granary, tile silo in barn. Peter Wuest, Medford, Wis.

WOULD YOU SELL YOUR FARM if you got your price? Sell direct. No commissions. Particulars free. Charles Renich, G-2, Woodstock, Illinois.

IF YOU WANT TO SELL OR EXCHANGE your property, write me. JOHN J. BLACK, 24 Street, Chippewa Falls, Wis.

WILL TRADE farm in Polk county, Ark., for Wisconsin or Illinois land. L. Temmey, 509 Brownell, Lincoln, Neb.

TWO FARMS FOR SALE—Near town, school, etc. Will rent one to right party. H. V. Peoples, Ladysmith, Wis.

WANTED—To hear from owner of farm or unimproved land for sale. O. K. Hawley, Baldwin, Wis.

FARMS FOR SALE—Address Reuben M. Ellerd, Box 6, Plainview, Texas, owner.

POULTRY AND PET STOCK.

BARRED PLYMOUTH ROCKS and Buff Orpington ducks; Chicago winners; great layers; established 1892; eggs for hatching: $1.50, 15; $4.50, 50; $8, 100; prompt delivery and good hatch guaranteed. G. Earl Hoover, R. 24, Matthews, Ind.

HATCHING EGGS; prize-winning S. C. Reds, White Wyandottes, Buff Orpingtons, S. C. White and Brown Leghorns, $1.50 per 15. Ledge View Poultry Farms, Box W. F., Fond du Lac, Wis.

HATCHING EGGS—S. C. Reds, prize-winners all leading shows. Eggs, $1.50, 15; $8, 100. Order from this ad. Address C. L. Pre-Fontaine, Box 600, Fond du Lac, Wisconsin.

TANNING.

LET US TAN YOUR HIDE—Cow, horse or calf skins for coat or rug. Catalog on request. The Crosby Frisian Fur Co., Rochester, N. Y.

FARM MECHANICS

Auto, Farm Engine and Farm Machinery Ailments diagnosed and remedies suggested in this department

Questions and Answers.

Tire Filler.

Do you know of a company that makes a fluid to put in a bicyle tire to make it solid?

Answer.—There are at least two companies making such a fluid, which consists largely of cork and rubber. Your dealer in auto supplies should be able to supply you. One of these compounds is called "pneumastic."

Use of "Spark Gaps."

I have bought a set of four spark gaps from an auto supply company. I have since been told that some spark gaps do more harm than good. Is the Marvel one of these? If so, where can I get a set that is practical?

Answer.—We have never heard any complaints from the use of the Marvel spark gap, and see no reason why it should injure your motor. Whether or not it will benefit your motor you can best find out by trying them. It is a disputed point as to whether or not a spark gap is of any value.

Some Steam Engine Questions.

I would like to know the horse power of my little double-cylinder steam engine. The cylinder is two and one-half inches diameter and the stoke is four inches. How much can each cylinder pull? How much steam pressure is required to pull that amount? How much pressure is required to pull it at its limited strength? Would it be strong enough to force as many pounds of water into a tank as it takes pounds of steam? If not, how many pounds could it force? Is it harder to force water in at the top than it is at the bottom of the boiler? Why? Is as much steam used in pulling a light load as in pulling a heavy load? Why is it? Does this engine require a governor to run steadily on unsteady work? If so, how could one be arranged when there is no flywheel or shaft to run one?

Answer.—To find the power of a steam engine, multiply the area of the cylinder in square inches by the average pressure in the cylinder by the length of stroke in feet by the number of power strokes and divide by 33,000, the result being the horse power of the engine. The average pressure in the cylinder may be roughly estimated at one-third the boiler pressure. In a double-acting steam engine, that is, an engine having steam on both sides of the piston, the number of power strokes is equal to twice the number of revolutions of the crankshaft. By the above rule, this engine would develop about one horse power at 300 R. P. M. and 100 pounds boiler pressure, which would be about right for stationary work. Steam automobile engines often run at 500 pounds boiler pressure. The amount of steam pressure that could be carried would depend upon the design of the engine, and could not be told without measuring the parts and calculating their strength.

How much water pressure an engine will pump against depends upon the size of the pump cylinder relative to the steam cylinder. If the average steam pressure in a four-inch diameter engine cylinder is fifty pounds, it should pump against nearly fifty pounds if the pump cylinder is also four inches in diameter, or against 100 pounds if the pump cylinder is only two inches in diameter. Practically, there is no difference between the power required to force water in at the top or bottom of the boiler, the back pressure from the steam being the same in each case. The heavier the load the more the steam required to pull it. The engine derives its power from the steam and the power is proportional to the amount of steam.

We have never seen an engine without a crankshaft or flywheel, excepting turbine engines. We are wondering whether the engine you refer to is a boiler feed pump and not an engine at all. If so, it could not be used as an engine, but could be used to force water into the boiler from which it draws its steam.

Electrolyte Too Weak.

Last summer I purchased a Model 90 Overland car that has a Gould storage battery. The other day I tested the acid with a hydrometer and it showed only half charge. I ran the engine about four hours as fast as it usually runs on the road when making twenty-two miles per hour. At the end of that time the acid was bubbling and the outside of the battery was as warm as a person's body. Still it did not test more than half charged. I noticed that the acid in the cells looked grayish. Is that all right? Is there something wrong, or did I not run long enough?

Answer.—Either your hydrometer is wrong or the electrolyte of your battery is too weak. With the battery fully charged add enough acid to each cell to bring the specific gravity up to 1.300. The milky appearance of your electrolyte is due to particles of gas in the electrolyte, and is a natural state of a battery while or after charging.

Charging Auto Batteries From Delco Light.

I have a Delco lighting plant. It generates thirty-two volts. I wish to charge my storage battery from this. Can I take three of the cells out of my lighting battery and put in their place the three cells of my auto battery and charge them? How long would it take to charge them, the generator generating twenty amperes?

Answer.—It would injure your lighting battery to take out three cells as you suggest. The three cells would not be charged as much as the others, which would be an undesirable condition. It would be much better for you to arrange an outfit as shown in the figure. Connect the positive terminal of the auto battery to the positive terminal of the lighting battery and the negative terminal of the auto battery to the negative terminal of the lighting battery through a switch and water resistance as shown in the figure. B is a bucket of salt water; CC are two carbon rods extending down into the water and supported by the boards, PP. To use the outfit, connect the battery, start the engine and close the switch, having the carbon rods well separated. Then move the rods closer together by sliding the boards until the ammeter shows about eight amperes being furnished the auto battery, unless this amoun overloads the generator. You can then charge the auto battery at the same time that you are charging the lighting battery. It would take five to ten hours to charge the auto battery, the time required depending upon the ampere capacity of the battery and the amount of discharge.

SAVES 4/5 of the FUEL COST

IF you could feed today's $20 pork on yesterday's 50 cent corn, your profits would automatically increase.

If you could run your gas engine today on yesterday's 10 cent gasoline, there would be another immediate increase in your profits because of an immediate decrease in your cost of production.

With the new Evinrude Oil Engine you use kerosene and low grade fuel oils—the cheapest fuels obtainable—and realize a clean saving of four-fifths of the fuel cost. Every atom of fuel is converted into energy.

Consider what that means. You get the same efficiency and power from these low priced fuels that you do from costly gasoline, yet four-fifths of the cost is saved, a four-fifths which goes directly into your pocket as added profit.

Combined with the economy factor are other features which make this the ideal farm power.

OIL EVINRUDE ENGINE

(unconditionally guaranteed)

is heir to none of the usual gas engine difficulties. No carburetor or mixing valve, batteries, magneto, timer or spark plug to cause annoyance or create expence. It can be operated by the hired man or your boy as easily as by yourself.

The fuel is introduced directly into the cylinder by a patented spraying device and ignited by the high temperature generated by compression. The engine starts readily, even in zero weather and will run without attention as long as there is fuel in the storage tank.

Tear out this page, write your name and address on the margin, and mail to us for catalog and fully descriptive literature.

GOOD MEN WANTED TO LEARN THE AUTO BUSINESS

Any ambitious, capable young man can make a success for himself, and if you will only prepare yourself, you will get work, because positions are open, waiting for competent men to do Auto and Electrical work.

The American Auto College develops your talent for a splendid, big paying trade. Our course has been enlarged with lots of new work—principles of Knight Motors, 8 and 12-cylinder Engines of new models, Tractors, new Starting Systems, Magnetos, Wiring, Coils, Welding, Brazing, Lathe work, Milling and Drill work, Tool making, Overhauling and Repairing, and all the newest, up-to-date Auto equipment.

AUTO College

$900 TO $3,000 SALARY OR BUSINESS PROFITS PER YEAR

Positions Are Open
Tinker repair men are let out as fast as good men are found to take their places. Garage men, letters and telegrams come to us asking for good men. Just prepare yourself and your future and success will be started. Think of the good time, and the money you can make.

LIFETIME OPPORTUNITY—It's up to you to be either a common, hard-working laborer or else learn a good business. Thousands of men will go into the Auto business within the next year. Be one of them. We want you to. Get started right away. Learn here where the opportunities are greatest and best, by our system of actual work in our large shops. No books used; we furnish tools. You do the work yourself. Our men learn easily and quickly because practical work is the best.

Big Electric Starter and Tractor course FREE with the regular Auto course. Write for our big FREE Catalog now.

Ailing Animals.

Weak Digestive Organs.

I have a colt that has had the scours for the past two years. I first thought it was his teeth, but he is coming five years old in the spring and I had a veterinarian look at him and he said it was not his teeth. He advised me to give him castor oil and feed him some flour in his feed, but this did no good. He is worse when eating grain than when he roughs it.

Try to get this horse to eat about one quart of wheat bran and one tablespoonful of oil meal once a day with or without other grain. In addition to this, have your veterinarian get sulpho-carbolate compound and give for several weeks. Also feed regularly with good feed, good water and shelter properly.

Testing of Drugs.

Can you test the medicine that is good for colic? How much would it cost?

If you have a preparation you wish to have tested it will be necessary to send it to a chemist.

Weak Ankles.

I would like some advice regarding my shoats. They were farrowed about the first of May. They get weak in the ankles and in about a week they cannot walk. Have been feeding them corn with slop made of middlings. They eat well and do not look sick.

Try feeding oats instead of corn, and make slop consisting of wheat bran, middlings and a small quantity of oil meal. It should be still more beneficial if you can add milk to this slop.

Sterility.

Last spring when my cows freshened they did not clean properly and discharged matter with a bad odor for thirty days or so. They are young cows ranging in age from three to ten years. Now I have trouble to get them with calf. They are fed alfalfa hay and silage.

Cows fed heavily on corn without much exercise, or cows beginning with contagious abortion, often retain the afterbirth. This, if not removed properly and at the correct time (which is usually from twenty-four to forty-eight hours after calving), results in an inflammation of the womb with either temporary or possibly permanent sterility.

Sniffles.

I have a bunch of forty fall pigs about two months old that have the sniffles. Is this disease contagious, and what will cure it?

Sniffles (or necrobacillosis) is an infectious disease and hogs affected with sniffles show difficulty in breathing, discharge from the nose, or thickening of the bones of the face. A general unthriftiness is noticed in many of the hogs. On account of necrosis of the bones of the face it is not possible to efficiently treat these cases. Separating the well from the affected hogs and changing quarters if possible is advised. If not, thorough disinfection of the pens may give you some degree of satisfaction. Those affected most should be killed and burned. As a rule, disposing of all the hogs on the farm, cleaning and disinfecting thoroughly before purchasing or raising more hogs is the most satisfactory method to combat this disease.

Pinworms.

I have a ten-year-old mare that was troubled with pinworms all last winter. I had our local veterinarian treat her, but with no success. During the summer months I turned her out on grass occasionally and I haven't seen her pass any for some time until just recently since I started to feed her on hay and oats.

It is not an easy matter to treat successfully for pinworms. Their number may be greatly lessened and sometimes the animal may be freed of them entirely by the following treatment which acts indirectly upon the worms by building up the animal's resistance and vitality. She should receive one quart of wheat bran and one heaping tablespoonful of oil meal once or twice a day for two to three months. Also salt regularly. Light driving or work is beneficial.

Blindness in Sheep.

My sheep are going blind. Their eyes are bloodshot all around the pupil and the pupil turns nearly white. The eyes do not water much. I have two flocks and this trouble broke out in both bunches at the same time. The blindness seems to come on them all at once. They eat well. All they had to eat during the summer and fall was blue grass pasture. Would shutting them up in the same yard every night have anything to do with it? They are two year olds and three year olds.

During the fall with sudden changes of weather sheep quite often take cold and their eyes look like they were entirely blind. This may be the case with sheep or this may disappear in a short time. Make a solution of one rounded tablespoonful of boric acid to one pint of warm soft water and bathe their eyes once to twice a day. Do not allow the sheep to be out in the rains, and give them good, dry, well-bedded quarters, and avoid drafts if possible.

Announcement has been made that the food administration will exercise complete control over export shipments of flour from this country to Europe. The intention is to centralize the handling of flour so that there will be the least possible loss either in food value or in shipping facilities. Another feature of the plan is to prevent any irregularities in the time or quantity of shipments made to the allied armies.

For draining land, be sure to get tile of the proper size. If it is too small it will fail in wet weather just when it is needed most. A tile drain that will carry off one-fourth inch of water in twenty-four hours from the area it drains is adequate under most conditions. If the tile is smaller than four inches in diameter it will have a tendency to fill up with silt.

Mr. E. S. Millard, of Beaver Dam, Wisconsin, is anxious to get into communication with Belgan hare breeders. He has read such glowing accounts of the big profits in this business that he is somewhat in doubt about the advisability of taking up this line and he is particularly anxious to hear from those who are breeding Belgian hares on rather a small scale.

OPPORTUNITY FOR SALE

The Best Located and Equipped Dairy Farm and Plant in the State of Iowa

On account of the enormous increase in the Canadian business of The William Galloway Company, which from now on will require more or less of William Galloway's personal time at Winnipeg, we will offer at private sale our 240 acre dairy farm located between Waterloo and Cedar Falls. Farm is equipped down to the very last detail with very best dairy and pure bred stock breeding equipment including fire-proof tile and cement barn, creamery, and two 200-ton silos filled with silage, manure pit, litter carriers, and everything necessary to produce certified milk. New modern horse barn and two fine modern farm dwellings. Barns and houses equipped with every city convenience, including electricity, running water, sewage, etc. Many out buildings, including modern granary, hog, chicken, tool and implement houses. Farm fenced hog tight except sixty acres. Total improvements new and cost over $40,000 five years ago, which would cost 30 to 50% more now. Every foot of the farm tiled and in high state of cultivation and fertility. Positive money-maker for right man. An opportunity for the city man who wants one of the best dairy farms in Iowa, or for business farmer with large family. Milk route brings in gross cash revenue of $10,000 to $12,000 a year, and cannot supply the demand at 15 cents a quart, which business goes to the farm buyer uninterrupted, including good will.

Farm located only ¾ of a mile from pavement of city of Waterloo, population 36,000, one of Iowa's best and most progressive industrial cities, and only three miles from city limits of Cedar Falls, a town of 8,000 people, with rare college advantages, on main road between these two towns, which location guarantees a constant increase and investment value. Not a cheap farm but worth every dollar and more than we ask. Will bear the very closest investigation as an investment and money-making dairy proposition. Farm famous for the many blue and purple ribbons won by its Holstein and Ayrshire herds.

Will make good terms to right party, but do not answer this ad unless you mean business and have money enough to swing a deal of this kind.

Very picturesque and beautiful location; fine oak trees, and beautiful shaded background, ideally landscaped. Also good orchard.

A nationally advertised breeding business and dairy farm like this is a rare opportunity for the right man, so don't delay answering this ad if you are in the market for a proposition of this kind.

Galloway-Messer Farms, Waterloo, Iowa

—that's what thousands of farmers say, who have gone from the U. S. to settle on homesteads or buy land in Western Canada. Canada's invitation to every industrious worker to settle in Manitoba, Saskatchewan or Alberta is especially attractive. She wants farmers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops to feed the world.

You Can Get a Homestead of 160 Acres FREE

or other lands at very low prices. Where you can buy good farm land at $15. to $30. per acre that will raise 20 to 45 bushels of $2. wheat to the acre—it's easy to become prosperous. Canadian farmers also grow wonderful crops of Oats, Barley and Flax. Mixed Farming is fully as profitable an industry as grain raising. The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools and churches, markets convenient, climate excellent. Write for literature and particulars as to reduced railway rates to Supt. Immigration, Ottawa, Can., or to

Quality in Dairy Products.

Quality counts in the dairy business. Not infrequently has success or failure hinged upon this one factor. The basic reason why quality counts for so much is the fact that milk is highly susceptible to contamination. The public is aware of this, which knowledge makes it appreciative of quality. Once the public becomes aware of the fact that any certain dairy furnishes milk of excellent quality and which can be depended upon regularly, that dairy is assured of a ready market among the better class of customers.

A few years ago there graduated from the short course in a corn-belt agricultural college a young man who had been enthused with a desire to establish a high-class dairy. Accordingly he began operations on a farm overlooking one of the best cities in the corn belt. He used tuberculin-tested cows when tested herds were rare. He kept his barn and his milk house scrupulously clean. Customers learned that milk from that particular dairy was always clean and wholesome. The result was a demand that could be supplied only in a very small part. Delivery was restricted to a few streets in the residence section nearest the dairy. Thus delivery was made at a low cost and at the same time the proprietor received nearly 50 per cent above the usual price for his milk. It was quality alone that won this success.

Even more striking is the success of a sincere simple-hearted resident of Salt Lake Valley in Utah. In seeking an opportunity to do something for mankind he decided that it should be his work to produce clean milk for babies. In his milk business he had seen that thousands of cases of sickness in babies were caused by poor milk. To save the lives of those children by furnishing pure milk was to be his life work.

This man, of course, tested his cows for tuberculosis. He built a large open shed for shelter in order that the cows might be kept more healthy. He used the barn only at milking time. Beside his milk house he built a sun room, the sides and roof of which were of glass. Utensils used in handling the milk were washed and scalded thoroughly and were then placed in the sun room and kept there throughout the day.

All milk from that farm was clean. Mothers learned of it and sought it for their babies. The fame spread and from all parts of the city there came calls for pure milk. It was not possible to restrict the district over which the milk was delivered. However, the demand was so strong that it could not be sold to any place except with the understanding that it was to be used only for babies. Naturally a price considerably above the average was received for milk from this farm. It was worth the extra price. It was quality that made it good and which made it popular.

Sanitary milk, so called, has always sold at a premium because of its cleanliness. Sanitary milk is produced under the supervision of a city board of health. Just as the people have confidence in the city board of health they likewise have confidence in the sanitary dairies.

In butter, quality counts for much. We have all eaten good butter and we have eaten bad butter. Good butter is always at a premium and poor butter nowhere receives a welcome. In the days when our mothers delivered butter to the local grocery certain ones of them were always very much in favor with the customers on account of the excellence of their butter. There is no one who does not appreciate good butter and who does not detest an inferior product.

Two creameries one time started business in the same town. One made good butter. The other did not. The one survived and prospered, while the other lost prestige and was finally foreed to quit business several thousand dollars in debt.

In cheese quality makes the difference between a palatable article and one utterly unfit to be eaten. The dairy that makes good cheese always has customers on the waiting list and the store that handles only good cheese never lacks for calls for it. On the other hand, the dairy that is unable to make an appetizing article usually has its shelves full and the owner is tempted to blame the ficklemindedness of the public for not consuming his wares. The store whose keeper does not know cheese or who is indifferent and who handles "just cheese" has but little call for it. It is quality in cheese that makes it acceptable to the public and which makes them take it home in goodly portions.

It is good business to produce dairy products of quality. Consumption is increased when quality is present. Quality is pleasing to the consumer and leads him to purchase and to eat more of it. It is plain, then, that quality leads to a greater demand and to a stronger market and to a better price. Quality insures a regular and a substantial market. Quality is in one sense the appreciation of good business methods to the dairy industry. Good business principles require quality and anyone who overlooks this important factor is certain to be less successful financially as well as to be rated as on a lower plane among producers.

Doubtless the quality of dairy products is improved rapidly. Dairymen are watching sanitation on their farms more closely. They know that bacteria cause souring and decay and they know how to avoid them. Improvement in quality means that the average standard of the business is on a higher level. Improvement in quality means advancement and success.

Growth of Cow-Testing Associations.

That coöperative cow-testing associations are successful in this country is shown by the fact that since 1906, when the first association was organized, in Michigan, the number has increased steadily to 459 associations, in forty states. On July 1, 1917, there were 11,720 herds, with a total of 211,966 cows being tested regularly in these associations. The total number of milk cows in the United States at that time was 23,372,200, of which .91 per cent were numbered in these organizations.

The first cow-testing association was organized in Newaygo county, Michigan, January, 1906, is still in existence and now has thirty herds with a total of 304 cows. The following year three new associations were organized in that state. In 1908 three were organized in Maine and one in New York. The next year five other states entered the list.

Wisconsin now leads in the number of associations, eighty-one being in operation in that state. Other leading states are Vermont, with forty-seven; New York, with forty-three; Iowa and Ohio, with thirty each; Minnesota, with twenty-six, and Pennsylvania, with twenty-four. During the year ended June 30, 1917, ninety-five new organizations were established.

Dairy Calves and Veal.

The one big object on a dairy farm is to produce milk. The idea is to produce the greatest quantity of milk in return for the outlay in farm investment and farm equipment and in cows and more directly must the returns be sufficient to pay for labor expended and feed used. The ideals of any good dairymen are for milk production. He is not a beef producer. His help is trained and organized for dairying and not for beef growing. Just now the dairyman's two big problems are the high price of feed and the scarcity and high price of labor. Any venture he may make in the way of beef production increases each of these problems.

With a given amount of feed more edible human food will be produced by dairy cows than by beef animals. Hence, were the dairyman to curtail his milk production in order to grow his male calves to maturity he would be diminishing the amount of food units returned to the world by his farm. The farsighted dairyman believes in the old adage of the "shoemaker sticking to his last."

Economic conditions have given rise to the practice of marketing the surplus dairy calves at an early age. It has been found to be an unprofitable practice to retain dairy-bred calves for beef. At best a dairy-bred steer makes rather poor beef that is discriminated against on the market and which can be marketed only at a lower price than his beef-bred brother. There is less discrimination with reference to calf stock. Dairy-bred veal sells readily and at a good price. One dairyman has said, "I can now sell my calves for $20 each. Were I to feed them through the winter on high-priced grain, hay and silage, I should possibly receive but $22 to $25 for them in the spring. This would be a losing game for me." Doubtless he was expressing the thought of the great majority of dairymen upon the subject of calf slaughter versus the preservation of all calves for beef.

Doubtless nothing but the best of motives prompt those who advocate the feeding out of all calves. However, they omit many of the essential details in their line of talk. A favorite argument is to show the contrast of the amount of beef that is to be

WHY KEEP COWS?

¶ Why not let cows keep you? The average cow is insufficiently fed and working two-thirds time. The lost one-third would be nearly all profit.

¶ What you want is results not theory. What makes a 10000 lb. or 30000 lb. cow? Simply good feeding methods and the right feed. Our business is feeding cows right.

¶ Why did Jolie Topsy make 1032 lbs. fat? She was fed Unicorn Dairy Ration. Unicorn helps any cow do her best.

¶ Practice beats theory. You can't fail with Unicorn. Dairying is profitable with good cows. Feed your cows Unicorn and make more money.

¶ Don't save fifty cents and miss fifty dollars. Representative leaders of every dairy breed are now using Unicorn with satisfaction. Every bag equally uniform. Send for Cow Testers' Manual free and proofs.

CHAPIN & CO., Dept. H CHICAGO

A necessity for successful dairying

25% to 40% Waste in Feeding Whole Grain

No Waste in Sucrene Feeds

Every Pound Brings Results

It takes an animal from seven to ten hours to digest whole corn or oats. Test feeds made at Michigan Agricultural College, with six cows for seven days, showed that 26.46% of whole corn and oats fed was lost—not digested. Other tests have shown a loss of 40% and even 50%, according to the condition of the grain and the animal.

Can you afford to waste a peck or more out of every bushel of grain you feed?

Sucrene feeds offer patriotic stock feeders the opportunity to heed the world's cry for more food, and do their part to prevent the waste of whole grain in stock feeding.

Sucrene Feeds are more easily and more completely digested than whole grain, because they are composed of a variety of grains and grain-products ground to proper fineness for easy assimilation. The variety of nutrients they contain, correctly proportioned, meets every need of the animal for increased productiveness and body maintenance.

Every dollar you invest in Sucrene Feeds comes back to you with big interest added. Every day's ration produces adequate results in milk, beef, pork, veal or poultry products.

Sucrene Dairy Feed Makes Money Five Ways

It brings up the milk yield. Cuts down the feed bill. Keeps cows in better health. Saves you trouble and expense of mixing—saves your grain.

Sucrene Dairy Feed is composed of molasses, cottonseed meal, corn gluten feed, ground and bolted grain screenings, clipped oat by-product, distillers' dried grains and solubles, palm kernel meal, calcium carbonate, and a little salt. Guaranteed analysis: 16½% protein, 3½% fat, 46% carbohydrates, 14% fibre.

All Cows Crave Sucrene Dairy Feed

because it is sweet smelling, palatable, soothing to their digestive systems—keeps them in better health and spirits. Although molasses is but one of the eight nutrients in Sucrene Dairy Feed, it is a very important one. Prof. H. J. Patterson of Pennsylvania State Agricultural College, says in Bulletin No. 117: "Feeding tests show that the addition of molasses to a ration has a tendency to increase the digestibility of both grain and hay."

All Sucrene Feeds are rigidly tested in our own laboratories and experimental farms. We know them to be result producers and back them with a positive guarantee of quality.

Order a ton of Sucrene Dairy Feed from your dealer at once. If he does not handle it write us his name and we will see that you are supplied.

Fill out and mail us the coupon or write us a postal for illustrated literature giving much valuable information on feeding live stock.

Have You Learned that KOW-KURE Can Make a Difference?

It is common knowledge in thousands of the best dairies from coast to coast that Kow-Kure has no equal as a medicine-tonic for cows that are "off color." Such common ailments as Abortion, Barrenness, Retained Afterbirth, Scouring, Lost Appetite and Bunches are promptly eliminated by the active medicinal qualities of Kow-Kure, working on the digestive and genital organs.

As a preventive of disease, the occasional use of Kow-Kure will pay big returns in increased vitality and improved milk yield. Used before and after calving, Kow-Kure will prevent Milk Fever and Retained Afterbirth, and enable the system to resist the other diseases which frequently start at this period.

If you have a cow that is not yielding as she should, something is wrong with her organs of production. Try Kow-Kure and note the prompt improvement in appearance and yield.

Sold by druggists and feed dealers; 55c and $1.10 packages.

Abortion in Cows

Answers every question. Tells how to treat your own cattle at small expense.
Send for booklet now. A postal will do. State number of cattle you own.

secured off a young calf or off the same animal fully grown. The practical dairyman sees in that picture quantities of feed to be consumed and hours and days of labor to be expended and farm equipment to be increased and raises a question as to who is to pay for them. There is yet to be seen any critic of calf slaughter who offers to buy up young dairy calves and feed them out on his city lot. Neither has there appeared any man who offers to furnish in advance the amount of feed required to transform a small calf into a full-grown bullock.

Legal restraint upon the slaughter of calves would decrease the amount of milk because fewer cows could be kept on account of feed limitations as described above. Such legal restraint would lead to an inverse increase in the slaughter of cows. It is then to a large extent a question of whether young dairy bull calves shall be slaughtered or whether a greater number of dairy cows shall be sent to the packer. Cows are all too scarce and milk is becoming scarce and high priced. Hence it is more justifiable that milk production shall be increased rather than decreased. The dollars and cents of the business demand that the cows be retained, and, in order to do this, the dairyman must market his calves as he has been doing in the past.

Dehorn the Dairy Heifer.

There are two methods of dehorning dairy animals. One of these which is widely practiced is to allow the horns to grow until the animal is fairly mature and then cut them off with special dehorning clippers. This method removes the horn, but it is a painful and bloody operation. The other method is to prevent the horns from developing.

The calves should be treated when they are from five to ten days old or when the horns are just beginning to show as small buttons and before they break through the skin. The hair should be clipped away from this part of the head with a pair of shears. As soon as the skin is thus made visible it should be broken with a sharp instrument directly over the center of the appearing horn. A deep cut should not be made. As soon as the skin is broken a stick of caustic potash should be rubbed on the horn until the skin is removed over an area slightly less than the size of a dime. The caustic can be purchased in small white sticks about the size of a pencil. One end should be wrapped with paper or cloth to protect the fingers. Rubbing should continue over the surface until it begins to turn white. Too much rubbing may give bad results. As soon as this is complete it is well to grease around the treated area with vaseline.

It is usually better to use the caustic in a dry form rather than to use it wet, because when too much moisture is present it may run down into the calf's eyes and cause injury.

The caustic should be kept in an air-tight bottle because in the presence of air it becomes wet and sticky and is difficult to handle. With a little experience one can perform this operation in about five minutes and horns will never develop, says W. W. Swett, of the University of Missouri College of Agriculture. In case it is not properly done, short spurs will develop. These may be clipped off after a year or two with very little trouble or injury to the animal.

Persistent Milkers Are Most Profitable.

Persistent milkers—the kind that milk well for a whole year, not the type that yield abundantly at first and then soon drop down in production—are the winners in the long run, according to dairymen at the Ohio Experiment Station. The steady cow is usually the most profitable one.

Some cows in the station's coöperative dairy work have yielded considerably above the average at the first of their lactation periods, but within two or three months their yield would fall nearly a third and by the end of the period would be only a fourth of the original production. The average daily yield for the period was found to be more than seven pounds less than that of cows having a comparatively uniform record from month to month.

Cows tend to decrease in milk flow as the lactation period advances. The milk yield of ninety-six Jerseys fell 47 per cent and their fat record 42 per cent in ten months. Ninety-six Holsteins decreased their milk 49 per cent and their fat 47 per cent in the same time. The percentage of fat gradually increased as lactation advanced.

Feeding for Health and Vitality.

To the Editor:—On many dairy farms, especially where large quantities of purchased concentrates are fed, complaint is common that many of the cows fail to breed regularly. This complaint is becoming more common from year to year, and is making serious inroads on the profits of dairy farming. This inability to withstand heavy grain feeding and breed regularly means that some of the cows must be bred several times before becoming safe with calf. The result is some of the cows freshen at the least favorable time, thus cutting down the supply of milk when most needed to keep up even production, and causing a general upsetting of the farmer's plans for the year. In extreme cases abortion and sterility not only sweep away the profits, but ruin the herd for profitable dairy purposes.

It is high time that farmers began to practice methods of feeding dairy cows so that they will last longer, instead of feeding them to get the most milk. By far too radical methods of feeding are being advised by those who assume to be feeding authorities. It is wrong that so many dairy experts have divorced science from common sense in giving scientific advice along lines of feeding. But the most discouraging thing we have to contend with is the fact that so many farmers are willing to let these experts do their thinking for them instead of looking at the problem in relation to the health of their cows.

It is not my intention to discuss the problem of feeding from the standpoint of the veterinarian or scientist, but to present a few plain facts that seem to have a bearing upon the question of maintaining the breeding qualities of our dairy cows. In the first place, the failure to breed regularly is more common where heavy rations of protein by-products are fed. Many dairy experts explain this fact by arguing that great producing cows convert so much of their food into milk that their reproductive organs are very poorly nourished. This condition, however, is unquestionably the result, in great measure, of improper feeding, so that the whole question resolves itself into one of improved methods of feeding. Unfortunately for the dairy farmer, the feeds that possess the greatest amount of protein are the very feeds that possess the least power in nourishing the organs of reproduction. It can be further stated that some of the feeds that possess extraordinary power as milk producers are positive poisons to those organs. Witness the milk-making value of cottonseed meal, then witness the cows that have been fed upon it to the point of barrenness. Cottonseed meal contains, when at its best, a medicinal agent which acts directly upon the uterus and when fed to cows that are large producers it is likely to assist in producing an abortion. The fact that so many good producers abort after carrying their calves up to seven or eight months is a pretty good indication that it is not germ abortion. There are other feeds that have a similar, though less pronounced, effect. Such foods are very rich in protein, and, while they have a place in the economy of feeding dairy cows, they must be fed along with other feeds that counteract their evil effect and furnish an abundant supply of nourishment for the reproductive organs.

An even worse mistake than feeding too much rich protein feeds is that of taking the grain rations away from the cows suddenly and not feeding them enough of anything to properly nourish the growing fetus. Such a practice dwarfs both the milking and breeding qualities, entailing a double loss. It is between these two extremes that we find a safe and profitable system of feeding that provides an abundance of food that contains

less protein, even though a perfectly balanced ration for producing milk is not used. In carrying out this plan oats, bran, corn, clover and alfalfa hay and silage play an important part. It is time that dairy farmers heeded the signs of the times and followed the rules of common sense in feeding their cows. When we have a good cow we should strive to feed her and care for her so that her vigor and reproductive powers will be maintained. This we cannot do so long as we let our thoughts run altogether to milk in the pail. If we do not practice more rational methods of feeding we are sure to smash up in the dairy business before long. J. Meredith.

Program for Holstein Meeting.

The twenty-sixth annual convention of the Holstein-Friesian Breeders' Association of Wisconsin will be held at Burlington, Racine county, January 9-10, 1918. Headquarters will be at the Hotel Burlington and sessions of the convention will be held in the Burlington opera house. Beginning Wednesday morning, January 9th, at 9 o'clock, Mayor Runkel, of Burlington, will deliver the address of welcome, and J. P. Riordan, of Maysville, will respond on behalf of the association. R. J. Schaefer, of Appleton, president of the association, will deliver his annual address, followed by reports from C. J. Schroeder, of Racine, the secretary, and F. J. Bristol, of Oakfield, the treasurer. E. B. Hart, of Madison, will speak Wednesday morning on "The Value of the Fat in Milk in the Nutrition of Young Animals." The afternoon session will convene at 2 o'clock and the first address will be by Bruce Wescott, of Barton, Wisconsin, on "Raising Calves Without Skim Milk." Mr. Hart will give another address illustrated by lantern slides, after which the annual business meeting will be held. The Burlington Chamber of Commerce will provide entertainment for the evening. Thursday morning the convention will again convene at 9 o'clock, concluding first its business session. C. Larson, of Brookings, South Dakota, will speak on "Building up a Dairy Herd Through the Use of the Pure-Bred Sire." At the afternoon session at 2 o'clock Thursday, Oscar Erf, who has given the dairy world some notable papers on the cost of milk production, will speak on this same subject, followed by a discussion led by J. D. Jones, of Racine. In the light of price-fixing by the government, and the discussion incident thereto, this session will undoubtedly develop great interest. Late Thursday afternoon there will be a session of the board of directors.

Organized and incorporated in 1892 the Wisconsin association has had rather a slow development, but during the past year has been making very rapid gains and the membership, both as to personnel and numbers is now becoming fairly representative of the importance of this great breed of dairy cattle in Wisconsin. The Holstein-Friesian Association of America will hold its annual convention and a sale of world-wide importance in the city of Milwaukee in 1918. The dates are June 5th, 6th and 7th. The sale will be managed by H. A. Moyer, of Syracuse, New York, an able sales manager and an authority on Holstein cattle. The sale will be conducted under the auspices of the national association. The sale is to be known and advertised as 'The Moyer National Holstein Sale of Wisconsin." Wisconsin breeders will be given first chance to consign suitable animals, to the extent of at least twenty-five head and as many more as Mr. Moyer may select from Wisconsin herds. Holstein breeders of the state look for the year 1918 to be a record breaker in every respect. A wave of enthusiasm for this breed is sweeping over its loyal supporters in Wisconsin and this means new records in all departments within the coming year.

Cow Testing Reports.

Satisfactory Month in Dodge County.

To the Editor:—This month's work has been quite gratifying in regard to general progress of the association as a whole. Three hundred eighteen cows have been tested during the period, the remainder of the cows of the association being on the dry list. The high herd belonged to Emil Ulrich with his eleven grade Holsteins averaging 919 pounds milk and 33.7 pounds fat. Highest individual record was made by Nichtern, a grade Holstein owned by Carl Zimmerman. Her record was 1,398 pounds milk and 58.7 pounds fat. Several cows detected of "boarding" have been sold, and there are more upon which their owners are keeping a suspicious watch.

Coöperative buying of feed has also been practiced to quite an extent. To date four carloads of bran, one carload of gluten and one carload of oil meal have been bought coöperatively, affecting a saving which was closely estimated to be about $425. One new member has been added to the association. Condensery is paying for December milk, $3.10 for 4 per cent milk with 3 cents additional for every additional point, and cheese factories are paying around $2.80 per hundredweight.

The forty-five-pound list for the thirty-day period ending December 13th is as follows:

Owner, name and breed.	Age.	When fresh.	Lbs. milk.	P.C. fat.	Lbs. b'fat.

The NEW HINMAN MILKER

The HINMAN Milker has been made the recognized standard of perfection and efficiency thru our 10 years of concentration on one type of machine—the Individual Pump—Valve Chamber Milker.

10 Years' Success

Over 30,000 Sold

ACCOMPLISHMENTS ATTAINED

This specialization has meant refinement in design and workmanship—insured mechanical betterments—insured adaptability to the great variety of physical condition found in every dairy herd.

The cow does not have to be adapted to the HINMAN. Odd cows—nervous cows—easy milkers—hard milkers—and cows with uneven udders are made comfortable by the HINMAN Individual Pump—Single unit—adaptable—to-each-cow machine that always milks the same way day in and day out.

The HINMAN Principal Stands Approved. It's the only sure way to offset increasing costs in the dairy. It is no experiment for you when thousands use it successfully. Its simplicity and volume means low cost to you.

Protected Valve Chamber Patented. Guaranteed Free Service

Individual Pump with Simple Adjustable Vacuum Control

Study Specifications

Capacity:—1 man—3 milkers—18 to 25 cows per hour.
Weight:—17 lbs.
Power Required:—1-6 H.P. per single unit, gas or electric.
Pail Capacity:—40 lbs.
Protected Vacuum Valve Chamber:—patented; automatic—operates with no adjustments.
Demountable Claw:—seamless teat cups, improved mouthpiece rubbers, special grade rubber tubing.
Individual Portable Pump:—eliminates tank and pipe system.
Armco Rust Resisting Pail:—with patented bail rest for teat cups.
Individual Cow Record can be kept.

Natural Action Teat Cups with Improved Sanitary Claw

PERFECTION MILKER

The Labor Problem Solved

ONE man with a Perfection Milker can do the work of three men at milking time. In case of emergency your wife or your little boy or girl can do it.

The Perfection milks as the calf does—suction, downward squeeze, release. The Perfection is simple. It does not easily get out of order. No harness to bother with. The Perfection teat cup fits all sizes of teats. The pail is made of "Wear-Ever" aluminum, easy to clean and non-rusting.

L. C. Richards of Grand Forks, No. Dak., says:

"The Perfection Milker is doing fine. We milk 40 cows in an hour easily and the men like the work. With the present scarcity of help, I am afraid to think of what might happen if we did not have the Perfection."

C. E. Van Meter of Loveland, Col., says:

"The Perfection Milking Machine is giving entire satisfaction. We are saving one man's work with it on 20 cows, which will pay for the machine in 10 months."

Let the Perfection Milker relieve you of the labor problem and you will find that the world will seem much brighter.

Write for your free copy of our new illustrated catalog. You will find in it much valuable information.

If Words Were Birds.

"If words were birds
And swiftly flew
From tips of lips
Owned, dear, by you,
Would they, today,
Be hawks and crows,
Or blue, and true, and sweet—
Who knows?

"Let's play today,
We choose the best;
Birds blue and true,
With dove-like breast.
'Tis queer, my dear,
We never knew
That words like birds
Had wings and flew."

Dried and Corned Beef.

I am very much interested in preserving beef and pork for home use and just now I should like very much to have some good recipes for corned beef and dried beef. I should be very glad to have you describe these processes.—O. S.

Meat from fat animals makes choicer corned beef than that from poor animals. The plate, rump, cross ribs and brisket are the pieces commonly used for this purpose. The meat should be cut into pieces five or six inches square and of a uniform thickness. It should be thoroughly cooked and corned as soon as possible, as any decay in the meat is likely to spoil the brine during the corning process. The meat should never be brined while it is frozen.

Weigh the meat and to each 100 pounds allow eight pounds of salt. Sprinkle a layer of salt one-quarter of an inch in depth over the bottom of the barrel, then pack in the meat as closely as possible, making a layer five or six inches in thickness. Cover this with a layer of salt and follow that with another layer of meat. Continue alternate layers until all the meat and salt have been packed in the barrel, saving enough of the salt to make a good layer over the top. Let this stand overnight, then for each 100 pounds of meat add four pounds of sugar, two ounces of baking soda and four ounces of saltpeter dissolved in a gallon of tepid water. It would require about three gallons more of water to cover this quantity. When the brine is poured over the meat, cover with a loose board and weigh down with a heavy stone or piece of iron so as to keep the meat all under the brine. If any should project, rust would start and the brine would spoil in a short time. Thorough corning should be complete in twenty-eight to forty days.

The brine need not be boiled except in warm weather. However, when the meat is corned during the winter and kept over into the summer, it is best to watch the brine closely during the spring, as it is more likely to spoil at that time than at any other. Should the brine appear to be ropy or not drip from the finger freely when immersed and lifted, it should be drained off the meat and new brine added, first washing the meat thoroughly.

For dried beef the round is most commonly used, the inside of the thigh being considered best, as it is a little more tender than the outside of the round. In preparing meat for dried beef cut lengthwise of the grain, so that the muscle fibers may be cut crosswise when the beef is sliced for table use. A tight jar or cask is necessary for curing.

For each 100 pounds of meat weigh out five pounds of salt, three pounds of granulated sugar and two ounces of saltpeter, and mix all together well. Rub the meat on all surfaces with a third of this mixture and pack it in the jar as tightly as possible. Allow it to remain three days, then remove it and rub again with another third of the mixture. Pack again in the jar, this time putting at the bottom the pieces that were on top the first time. After three days, remove and rub with the remaining third of the mixture and allow to stand for three days more, when it is ready to be removed from the pickle. The liquid which forms in the jar should not be removed, but the meat repacked in it each time. When the meat is finally removed from the pickle it should be smoked and hung in a dry attic or near the kitchen fire where the water will evaporate from it. It is ready for use at any time after smoking, although the longer it hangs in the dry atmosphere the drier it will become.

Use Care in Heating Homes.

Through careful firing, regulation of temperature in rooms, and other means, thousands of tons of coal and, incidentally, an enormous excess fuel bill may be saved this winter. This coal is needed in the development of war-time industries.

The furnace or stove should be fired at regular and frequent intervals, care being taken not to allow the fuel to burn too rapidly.

Some persons are in the habit of forcing fires, overheating their dwellings, and then opening doors and windows in order to maintain comfortable temperatures. This is a waste of fuel and results in depressing the vitality of the occupants of such homes. An overheated smoke pipe usually indicates poor fuel economy.

Living rooms should be kept at a temperature of approximately 68 degrees and bedrooms 60 degrees. A temperature of 68 degrees is sufficient for health and comfort if the air has the proper humidity. To maintain a temperature of 75 degrees requires 10 per cent additional fuel. An even temperature within the rooms promotes fuel economy and contributes to the good health of the occupants.

The fire of a furnace should burn evenly over the whole grate and should be kept free from bright spots. The fuel bed should be kept free from clinkers. Excessive shaking of grates should be avoided in order to prevent loss of fuel.

Five Hundred Cans of Food Her War Bit.

Among the thousands of visitors who examined the food conservation exhibit shown by Iowa State College at the International Live Stock Exposition at Chicago recently was an elderly woman, who told the story of how she had done her war garden bit.

She was a woman of considerable means, wife of a retired farmer, and had expected to live in ease the rest of her days. She spent the summer visiting in a large city with relatives. This family had a vacant lot, so she planted it herself with vegetables and garden truck and took care of it all summer long. Besides supplying the family, she canned over 500 cans for use this winter. "It was my war bit," she said.

Resting the Fern.

Some time ago I noticed on the Home page advice about fern growing. One of your subscribers who said she had good luck with ferns advised letting the plants rest for two months a year. I would like to know which are the best months for this and if the fern is to be taken out of the pot.—Mrs. A. P. W.

If you watch your fern carefully you will be able to tell when it is ready for its rest. At this time it will not make use of so much water and if the usual amount of water is given you will find that it stands on top of the dirt. When this condition exists, give less water—only such an amount as will readily sink into the dirt. The fern is not to be taken out of the pot, but should be cared for in the usual way. The idea is that during its period of rest the fern will not send out any new shoots and, therefore, it will not require so much water.

Troubled With Flies Among Flowers.

To the Editor:—I have been troubled a great deal this fall and winter with flies among my plants and flowers. I cannot seem to get rid of them and I have been wondering if any of the readers have had similar trouble and could tell me what to do. The flies collect thickly around the plants. I do not know what brings them or how to get rid of them and would greatly appreciate advice from others.

Mary LeKose.

Care of Chinese Lily Bulbs.

To the Editor:—Will someone please tell me how to take care of my Chinese lily bulbs after they are through blooming? Will the old bulbs bloom again, and how old must the little bulbs be before they will commence to bloom? I am anxious to save my bulbs for another blooming and should like to know just how to care for them. Perhaps some of the Home page flower lovers can tell me.

An Old Subscriber.

Recipes.

Cream Johnnycake.—Two cups corn meal, half a cup wheat flour, half a teaspoon salt and one teaspoon soda, two eggs, one cup sour cream and one cup sour milk. Sift together the corn meal, wheat flour, salt and soda. Beat the eggs; add sour cream and sour milk and beat again. Stir the two mixtures together. Bake in a pan of such size as to have the mixture half an inch deep.

Southern Hash.—One-half can tomatoes, one pound Hamburger steak, one cup rice, two onions (cut fine), salt and pepper to taste. Boil rice and drain. Add other ingredients. Cook onion in a little fat before mixing. Bake in oven one hour.

Spanish Beans.—Two cups kidney beans, two cups tomato, one cup finely cut onion, one-half cup pimento, two tablespoons drippings, two tablespoons flour, one tablespoon salt. Soak beans overnight; drain, cover with boiling water; boil slowly an hour and a half, or until tender. Drain and add sauce made as follows: Put fat in frying pan, add onion and chopped pimento and fry until tender, but not brown. Add tomato, salt and flour mixed with cold water. Boil five minutes. Pour over beans and simmer ten minutes.

Coddle Apples.—Six tart apples, one cup corn sirup, one-half cup water, stick of cinnamon, or lemon. Pare and core apples. Boil sirup, add cinnamon or lemon juice and place apples in saucepan. Cook slowly until apples are tender.

Honey Cookies.—One-half cup shortening, three-fourths cup sugar, one-half cup honey, grated rind of one lemon, one egg and one yolk, two cups flour, one cup barley flour, four level teaspoons baking powder, chopped almonds, one egg white and sugar for glazing. Cream the shortening; beat in the sugar, then the honey and lemon rind; add the egg and yolk beaten together, then the flour sifted with the baking powder; more flour may be required. Knead slightly, roll into a sheet, cut into rounds, set in a baking pan, rubbed over with fat, brush with the egg white (beaten slightly), sprinkle with the almonds and sugar and bake.

Boston Roast.—Two cups dried kidney beans, one cup bread crumbs, two cups grated cheese, three teaspoons salt, one-half cup liquid, one tablespoon chopped onion. Soak beans twenty-four hours. Cook in salted water until soft. Drain; put through food chopper, add onion, cheese, crumbs, more salt if needed, enough of the water in which the beans were cooked to moisten. Form into loaf. Bake in moderate oven for forty minutes. Baste occasionally with hot water and fat.

Delmonico Potatoes.—Cut cold potatoes into one-third-inch cubes. Prepare white sauce, using three tablespoons barley flour, three tablespoons fat and two cups milk. Arrange potatoes, white sauce and cheese in alternate layers in a baking dish. Cover with oiled crumbs made from barley biscuits. Bake in oven until thoroughly hot and crumbs are brown.

THE YOUNG FOLKS.

Has Brother in France.

Dear Young Folks:—I am a little girl eleven years old. I have auburn hair and blue eyes. I am in the sixth grade and go to town school. We live on a farm of 112 acres.

I have two sisters and six brothers. My youngest brother is over in France working in a base hospital. He has been there since May and he is helping to care for the poor wounded soldiers. The hospital accommodates 2,000 soldiers and about 200 helpers besides the nurses and doctors. My brother works in the quartermaster's department. He has worked in six other departments also. Anna.

Young Folks Enjoy Community Hall.

Dear Young Folks:—I thought I would write and tell you about our community hall. The boys' club met at the schoolhouse for awhile and so did the grange. The boys' club and the grange got the neighborhood to help and they built the hall. They built a basement below and a big room upstairs with a stage in front. They have entertainments, oyster suppers and ice cream suppers.

The boys' club meets on Tuesday night and the grange on Thursday night, and the ladies' aid meets on Wednesday afternoon.

The hall is built between the church and the schoolhouse. They have a stove in the basement to cook on, and some tables for serving.

Last year the grange had a big fair and they are going to have one again this year. At the last fair they showed cattle, horses and mules. They showed all of the fancy work in the hall. The second day of the fair they had a picnic and in the evening they played baseball.

I am ten years old and am in the fourth grade.

I hope the Young Folks will like my letter. Grace.

A Young Trapper.

Dear Young Folks:—I have never written to you before. I am a boy eight years old. I live on a farm of 200 acres and we have eight horses and fifty cattle. I help milk and do some trapping. I caught two skunks and one weasel. Have any of you done any trapping this year?

I go to school most every day and am in the fifth grade.

We have two horses that I can ride. Their names are Bird and Pet. Olaf.

Is Going to Knit for the Soldiers

Dear Young Folks:—I would like to join your circle. I am a little girl eleven years old, with brown eyes and dark hair. I live on a 160-acre farm. I have one brother and four sisters. My brother and two of my sisters are married.

My papa owns a big brown Luverne car. He raises Hereford cattle.

I am going to knit for the soldiers. What are the other girls doing?

I have a dog and two kittens for pets. I go to school and take music lessons every Wednesday night. Helen.

Thinks the Country Best Place to Live.

Dear Young Folks:—I have read your letters for a long time and think they are very nice. I am a little girl fourteen years old and in the seventh grade. We have to go one-half mile to school. I have two brothers and one sister old enough to go to school. My little brother is only nine months old. He is just learning to stand alone. We think he is just about right because he is so cute.

We live on a 160-acre farm, but it is not our farm; we just rent it from another. I would much rather live in the country than in town. I never lived in town, but I think I will take the country for mine. You have got the country for yourself and in the summer you can go out in the pastures and gather armfuls of flowers, and you can wade in the water in the brooks.

Write some more stories, Young Folks. I love to tell stories to the little children, but I don't know any new ones. Virchel.

TAKE A Business Course

A TREMENDOUS DEMAND for trained young men and women. Salaries $900 to $1,250 per year. This school is known all over the Northwest for its superior training and ability to place its graduates. High school and teachers' courses. Also correspondence courses. Write at once for beautiful new catalog.

AUSTIN SCHOOL OF COMMERCE, Austin, Minn.

OUR FASHION DEPARTMENT.

ALL PATTERNS 10 CENTS EACH

WE CAN supply our readers with high-grade, perfect-fitting, seam-allowing patterns at 10c each, postage prepaid. Full directions for making, as well as the amount of material required, accompany each pattern. When ordering give correct number and size. Enclose 10c for each pattern.

Send 10c in silver or stamps for our up-to-date fall and winter 1917-1918 catalog, containing 550 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating thirty of the various simple stitches), all valuable hints to the home dressmaker. Address all orders for patterns and catalogs to THE WISCONSIN FARMER, Madison, Wis.

1880—Boys' suit. The pattern is cut in 5 sizes: 6, 8, 10, 12 and 14 years. It requires 2⅞ yards of 36-inch material for the blouse, and 1 yard of 44-inch material for the trousers for the 8-year size. Price 10 cents.

1908—Ladies' nightgown. The pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 6⅛ yards of 36-inch material for a 36-inch size. Price 10 cents.

1953—Ladies' waist in surplice style. The pattern is in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 2¾ yards of 44-inch material for a 36-inch size. Price 10 cents.

2144—A simple house dress. The pattern is cut in 7 sizes. 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 6¼ yards of 36-inch material. Price 10 cents.

Waist 2152-Skirt 2153—A stylish gown. Pattern 2153 is cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. The waist pattern, 2152, is cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It will require 6½ yards of 44-inch material to make the entire dress of one material for a medium size. Two separate patterns, 10 cents for each pattern.

2174—A simple dress for school or play. The pattern is cut in 4 sizes: 2, 4, 6 and 8 years. It requires 2½ yards of 27-inch material for the dress and 1½ yards for the guimpe, for a 4-year size. Price 10 cents.

2185—Infants' set, consisting of a cap, a sack, a nightgown and a dress. For the dress of flouncing, it will require 1¾ yards of 36-inch material with 1¼ yards of plain material for yoke and sleeves. Of nainsook or lawn 36-inches wide it will require 2¼ yards. The gown will require 2½ yards of 24 or 27-inch material. The cap, ½ yard of 18-inch material. The sack requires ⅞ yard of 27-inch material. Price 10 cents.

2302—A pretty frock for mother's girl. The pattern is cut in 4 sizes: 6, 8, 10 and 12 years. Size 10 requires 4¾ yards of 36-inch material. Price 10 cents.

2305—A new apron. The pattern is cut in 4 sizes: Small, 32 and 34; medium, 36 and 38; large, 40 and 42; extra large, 44 and 46 inches bust measure. Size medium requires 3⅜ yards of 36-inch material. Price 10 cents.

2312—A simple and attractive model. The pattern is cut in 3 sizes: 16, 18 and 20 years. Size 16 requires 4⅝ yards of 44-inch material. Price 10 cents.

Waist 2321-Skirt 2319—A new autumn frock. The waist pattern is cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. The skirt is cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It will require 9 yards of 44-inch material for the entire dress for a 36-inch size. Two separate patterns, 10 cents for each pattern.

2323—A simple, stylish dress for the growing girl. The pattern is cut in 4 sizes: 8, 10, 12 and 14 years. Size 10 requires 3⅜ yards of 44-inch material. Price 10 cents.

International Sunday School Lesson.

(By REV. P. B. FITZWATER, D. D., Teacher of English Bible in the Moody Bible Institute of Chicago.)

Lesson for December 30, 1917.

Review—God's Redeeming Love.

LESSON TEXT—Read Psalms 1:23; 1:24.

GOLDEN TEXT—With Jehovah there is loving kindness, and with him is plenteous redemption.—Ps. 130:7.

The lessons of the past year are the only ones in the six years course which are divided between the Old and the New Testament; therefore, at the close of this year we will review only the last two quarters, emphasizing the fourth which has just been completed.

Like Moses on Mount Nebo, let us glance over the whole period of the monarchy and note the progress and development of the Jewish people. The Jewish race is the marvel of all times, a nation without a country, scattered and peeled, chastised and driven from sea to sea, even slain in large numbers; yet possessed of a vitality which has caused them to endure through the centuries. Their contribution to the civilization of the world has been immeasurable. There is no walk or rank in life, in politics, literature, art science, business, religion, or any other realm where they have not made their impress and rendered their contribution. Any movement which seeks to promote their welfare and to strengthen the bonds of sympathy which preserve race feelings, deserves the aid of all patriotic, liberty loving, God-fearing people, for the Jews are still God's chosen heritage.

The united kingdom with its three kings, Saul, David and Solomon, lasted from about 1100 B. C. to 983 (Meecher), a period of 120 years. Then begins the divided kingdom—Judah and Israel side by side, a double experiment in the progress of the kingdom of God. This period extended from about 982 B. C. to approximately 723, or 721 B. C. Judah had a territory of about 3,400 square miles; Israel 9,400. Judah's capital was Jerusalem; in which was the temple; Israel's capital was Samaria, while it had two centers of false worship. Judah was more sheltered than Israel from close contact with heathenism, especially politically and religiously. Judah had one dynasty of rulers; eleven kings and one queen, all of them from the house of David. Israel had nineteen kings, belonging to nine different families or dynasties. Judah had several very good kings, and there were marked revivals of religion, of prosperity and of deterioration of varying degrees, though resisted from time to time and helped along moral and religious lines through the work of Elijah and Elisha the prophets. The final period of events of this past quarter have reference to Judah alone from the days of Hezekiah, B. C. 722, to the time of the destruction of the city and the temple being destroyed 586 B. C., and lastly we have the period of the exile from the first captivity in 605 B. C. to the restoration and the new temple being erected 516 B. C. This was a period of great discipline and sifting as like unto wheat or of a purifying fire.

The return from exile and the new spiritual nation, dates from about 536 to the close of Bible history, say 400 years before the coming of Christ. A map should be used, and the scholars ought to be familiar with the contemporaneous secular history. There are several particular lessons we ought to learn from this history.

First: Every failure, every moral wrong, every fall into idolatry, every diminution of power for good is the result of a separation from God—a departure from the ways of God and righteousness. It also shows us that God's constant solicitude that the Jews should be kept separate from heathenism and idolatry, had in it the best interests of his own people and could only lead to those blessings which he had prepared for his particular people.

Secondly: The overthrow of Israel is directly attributed to its complete abandonment to idolatry. Beginning with false worship and a dependence upon men, there was the introduction of idolatry and a development of evil which led to a rapid decline, the introduction of revolutions and the final extinguishment of the kingdom.

As to Judah, it finally was brought into captivity because that was the only way that God could purge the nation from the sin of idolatry. They must be taught that there is but one God, that the word of God must be obeyed, and that their safety lay in the faith which they placed in his promises. Th leaders of this period were Zerubbabel, Ezra and Nehemiah, heroic men, men of great consecration and power; also, Esther, the heroine. The prophets of this period are Daniel, Isaiah, Haggai, Zechariah, Malachi. Notice how each and every one aided the cause of righteousness.

There are two great heroes of the return, Ezra and Nehemiah. Take up the actions of each and show how he proved his heroism. A good method of reviewing the past quarter will be to summarize the teachings which center about these two great men. The period of the return is the one that we should emphasize, showing how a return to God and an obedience of his law is the paramount need of the present day in which we live, these days of darkness and evil upon which the world has fallen.

New KEROSENE Light

10 Days Free—Send No Money ::: Beats Electric or Gasoline

Sent Charges Prepaid

We don't ask you to pay us a cent until you have used this wonderful modern white light in your own home 10 days, then you may return it at our expense if not perfectly satisfied. We want to prove to you that it makes an ordinary oil lamp look like a candle; beats electric, gasoline or acetylene. Passed by Insurance Underwriters. Children handle easily. Tests by U. S. Government and 35 leading Universities show the new improved **ALADDIN**

Burns 50 Hours on One Gallon

common kerosene (coal oil); no odor, smoke or noise; simple, clean, won't explode. Over three million people already enjoying this powerful white, steady light, nearest to sunlight. Won Gold Medal at Panama Exposition. Greatest invention of the age. Live Stock and Commercial Field Notes

Collected by Representatives of The Wisconsin Farmer

Johnson Bros.' Great Duroc Offering.

JOHNSON BROS., the premier Duroc Jersey breeders of Winnebago, Minn., sell bred sows this year on Tuesday, January 8th, which starts the "ball rolling" in the Northwest. The entire offering will be made up of tried sows or fall and spring yearlings. These yearlings have been carried over open and naturally they have more size than if they had raised litters when around a year old. It is a great offering from start to finish and any man in need of a few registered Duroc sows should attend this sale. There will be two choice sows by that great breeding boar, Fancy's Victor, that Johnson Bros. had the misfortune to lose last summer. Six daughters of King the Col. would be attractions in any sale. Six by Pathfinder will be attractions. Three of them are half sisters to the Sensational High Orion. They are fall yearlings and big. One of the best sows in the sale is by Chief of Cols. Everyone appreciates this good breeding. A Pal's Premier sow will appeal to many. A sow by Golden Model 9th would look good in most any herd. Besides those mentioned there will be several daughters of the grand champion, Royal King. Some by Chief's Col. 40th, Gano Model Educator, Col. Pilot Wonder, Educator, etc. This is a sale that prospective buyers cannot go wrong on. The Johnson Bros. have the goods and The Wisconsin Farmer does not hesitate to recommend the offering. Wisconsin men that have made good in the breeding business are the ones that have gone out and bought the best. Many in the sale are bred to Orion King, he by Orion Cherry King. Orion King is a full brother to King Orion Cherry, the sire of the 26 spring boars that sold in a recent sale for an average of $420. Some have been bred to Royal King 2d, the best son of Royal King. Orion Combination has been used—he is a son of the well-known John's Combination. You can find what you want in this sale. By all means, get a catalog and if possible attend this great sale. Wisconsin breeders can leave La Crosse the night before the sale on the C., M. & St. P. and go to Austin; stay there that night and go to Winnebago the morning of the 8th; or go to Mankato, Minn., and down to Winnebago from there. If you can't attend send bids to T. P. Shreve. See advertisement on page 22.—Adv.

Stoehr's Orion King.

ORION KING, one of the best sons of the Wisconsin and Minnesota grand champion Duroc, King Orion, is owned by Mike Stoehr, Viroqua, Wis. Few boars in the state can claim a better pedigree. The world's champion Duroc sire is Orion Cherry King, for the get of this great boar has "cleaned the slate" the past two years at all the big shows. Orion Cherry King is the sire of Orion Cherry King Jr., the grand champion boar at Omaha in 1916, that sold for $3,500. Orion Cherry King Jr. is the sire of King Orion, the grand champion boar at the Minnesota and Wisconsin State Fairs, 1917. King Orion is the sire of Orion King. By this you can see that Orion King is no accident—he is produced from a line of breeding that has made good in the show ring and breeding pens. Mr. Stoehr has some good big sows in his herd. Their daughters have been bred to Orion King and are now being offered for sale. They are good and when you get your litter next spring by Orion King you will be glad that you bought a gilt from Stoehr. Write him for further information, and please mention The Wisconsin Farmer. See page 23.—Adv.

Maltby Has Two Good Boars.

C. S. MALTBY, Janesville, Wis., has two big-type Poland China boars that he has reason to feel proud of. Smooth King, a yearling, is big in every respect and is the sire of a bunch of gilts having the same characteristics. He is sired by Goldengate King, a sire of note. To cross on the get of this boar Mr. Maltby purchased a spring boar sired by Mouw's Black Jumbo, the Poppen boar, and he is out of a dam by Mouw's Chief, said by many to be the best living Poland China sire. He is the sire of Chief Defender, the Illinois grand champion. This pig has been recorded as Maltby's Black Jumbo. Smooth King gilts bred to Maltby's Black Jumbo should produce Polands that command attention. Mr. Maltby has a limited number of gilts for sale at reasonable prices. He will also sell a few tried sows and yearlings. These are safe in pig and if you are interested write the owner for details and prices. Note the advertisement on page 23. When writing please mention The Wisconsin Farmer.—Adv.

Turning Trees Into Firewood.

THE coal shortage is making a [illegible] wood [illegible] substitute for coal, so if you have timber on your land which can be turned into fuel, you will be doing a patriotic act [illegible] enough for your own use and putting what you don't need on the market to be sold at good prices. Cutting down trees and sawing up the logs is not as hard a job as it seems. The hard work has been taken out of it by the Folding Sawing Machine made and sold by the Folding Sawing Machine Co., 161 W. Harrison Street, Chicago, Ill. Their advertisement is on page 11. Read it and write for information.—Adv.

Waukesha Stock Farm.

F. E. FOX, Waukesha, Wis., proprietor of the above farm, writes that he has had five cows which have just finished records with an average of 609 pounds butter fat. This is a sample of some of the splendid work which Mr. Fox has been doing along the A. R. lines of herd improvement. The herd sire now standing at the head of this large, well-known herd is Benton's May King of Ingleside 27446, a four-year-old bull of much promise and great A. R. backing. Practically all of the cows in this herd are in calf to the above sire. The sire of Mr. Fox's herd bull is May King of Ingleside, that has sired 19 A. R. cows and that is in turn by Imp. King of the May, the noted May Rose bull that sired Langwater Hope, 1,003 pounds fat at six years. The dam of May King of Ingleside is Dolly Bloom of Langwater, A. R. 674, milk 12,024 pounds, fat 632 pounds and has a daughter with a record of 867 pounds fat. The dam of Benton's May King of Ingleside is Benton's Lady Chesterbrook of Ingleside and has a record of 690 pounds fat at five years, which places her at the head of the roll of honor class AA, as she carried a calf 265 days out of the 365 days on test. She is now on retest and will finish with about 750 pounds fat. Breeders looking for a place to get high-class foundation stock should keep this herd in mind and write to F. E. Fox, who is a prompt correspondent.—Adv.

J. J. Reid & Son, Oconomowoc, Wis.

SEVERAL weeks ago we received a picture of Ashburn Sir Ormsby Segis from the above firm that is a particularly well marked and handsome bull calf, sired by Sir Johanna Belle Boy, a grandson of Colantha Johanna Lad and out of Ashburn Segis Pauline, a very promising cow, that made 26.57 pounds butter in seven days as a junior three year old. This cow is a granddaughter of King Segis and was winner of Holstein-Friesian prize money in 1916. She likewise has 25 per cent of the same breeding as Segis Fayne Johanna, the only 50-pound cow. Write J. J. Reid & Son about him.—Adv.

Cole Buys Gerstdale Jones Boar.

WE have a letter from J. D. McDonald, West Salem, advising that he sold one of the Gerstdale Jones boars to A. W. Cole, Lodi, Wis. The boar purchased by Mr. Cole, was, in the opinion of many, the best boar in the litter. He is being bred to some of the best Poland China gilts that we have seen this fall. Cole has the goods from start to finish. When one can drive onto a farm and find 20 spring gilts that will average 275 pounds by the 10th of December, you can rest assured that he has the goods. These grand gilts are safe in pig to this son of the $6,600 Gerstdale Jones. See page 23.—Adv.

The Old Reliable.

P. N. COLLINS, River Falls, Wis., is one of Wisconsin's breeders who do not make very much noise, but he is selling registered stock all the time. He has the strictly big-type Poland Chinas and if you want anything in this line, he can fill the bill. He has a herd of Short-horn cattle and stock for sale at all times of the year. Mr. Collins has been a regular advertiser in The Wisconsin Farmer for many years and we have never had a complaint concerning his dealings. We gladly recommend him. We only ask that you mention The Wisconsin Farmer when writing for information. See page 23.—Adv.

Smiley Preparing for Great Sale Offering.

WE are glad to report that Wm. Smiley & Sons, Viroqua, Wis., will have the best line-up for their sow sale February 22d they have ever had. The gilts are doing fine and are being bred in good season. Many of them are safe in pig to Grandmaster Bob, he by a son of Big Bob out of an [illegible] pound daughter of Grand Master. We will have more to say later, but don't forget the Smileys this winter—they will sell you good, big Polands.—Adv.

Pellett & Sons' Chesters.

JOHN PELLETT & SONS, Viola, Wis., have two good Chester White spring boars and a few choice gilts priced for quick sale. The sows will be or have been bred to good boars and will be kept until safe in pig. They also have a litter of September pigs that are fine. Write these breeders for further information. See page 21.—Adv.

John Notseter, Deerfield, Wis.

ABOUT a week ago we spent a very delightful afternoon at Mr. Notseter's home and during the visit had a splendid opportunity to survey his excellent herd of Short-horns. The first glance at this herd was enough to convince anyone that Mr. Notseter had been breeding Short-horns for a good many years and that he was in love with the business. The uniformity of the herd also indicated that they had been bred along definite lines, likewise the disposition of the cattle indicated that they had been cared for by people who had their best interests at heart. In looking through a herd of cattle it is not difficult to form quite accurate opinions as to how it has been assembled and what care it has received. Our impressions of Mr. Notseter's herd were the best, and we believe that breeders on the market for Short-horn bulls that will give satisfactory service should inquire for particulars concerning the animals on this farm that are now being offered for sale. A number of years ago Mr. Notseter purchased two particularly good foundation cows; one of these cows was named Molly and the other Miranda. Most of the animals in Mr. Notseter's herd are either direct or indirect descendants from these two cows. Mr. Notseter is now offering a splendid two-year-old bull for sale, as well as three bull calves ranging from seven to nine months of age. See advertisement on page 21.—Adv.

Remember the Minnesota Short-horn Sale.

AS a last reminder we want to call your attention to that important event at South St. Paul, January 4th and 5th, when the Minnesota Short-horn Breeders hold a show and sale of some 90 head of cows, heifers and bulls. On the first day, Secretary F. W. Harding will judge the cattle. That evening there will be a banquet worth going miles to attend. On January 5th the cattle will be sold, sale starting at 9:30 a. m. Attend this sale if interested in cattle of this breed. If you have not received a catalog write to P. S. Jordan, Morris, Minn. When so doing kindly mention The Wisconsin Farmer.—Adv.

Field Men for The Wisconsin Farmer.

J. R. Garver, eastern half of Wisconsin. Address Room 201, Washington Bldg., Madison, Wis.

T. P. Shreve, western half Wisconsin and eastern Minnesota. Address 115 S. Main St., Janesville, Wis.

W. S. Steele, northwest Iowa, South Dakota, western Minnesota. Address Box 109, Sioux City, Iowa.

Fred V. Johnson, Wisconsin, Illinois, Indiana, Ohio, Michigan and Kentucky. Address 924 Hearst Bldg., Chicago, Ill.

Carlos C. Palmer, eastern half of Iowa and Minnesota and swine division in Illinois. Address 2714 High St., Des Moines, Iowa.

A. T. Cole, Missouri. Address 3900 Holmes St., Kansas City, Mo.

M. T. White, western Iowa and northeastern Nebraska. Address 4015 Izard St., Omaha, Neb.

The Burt Farms.

F. H. BURT, Duroc breeder, Brodhead, Wis., writes that his boars have sold well and that he only has a few left. Those on hand weigh from 200 to 270 pounds, the big, growthy kind, and they should make good in the breeding pen. He offers 40 spring gilts and when we last saw this lot, they were the best we ever saw on the Burt Farms. Mr. Burt says they weigh up to 260 pounds and are safe in pig to Great Model 229509, the boar that stood third at Milwaukee last fall and headed the futurity herd. Write him for Duroc information and please mention The Wisconsin Farmer. See page 23.—Adv.

Ceylon Court Farm, Lake Geneva, Wis.

GLENN G. GILBERT, manager, reports that they have just recently sold Loved One's Noble Lad, a yearling bull of much promise, to E. E. Sisson, of Burton View, Ill. This youngster is a grandson of Noble of Oaklands and Eminent. His breeding is well-known throughout Wisconsin and we suggest that Jersey breeders throughout the state desiring animals bred along these lines should get in touch with the Ceylon Court Farm at once, as their sale list is worthy of careful inspection. See advertisement on page 20.—Adv.

Do You Want Red Polls?

L. C. UNDERWOOD, Avoca, Wis., has on hand a fine assortment of Red Poll bulls. Mr. Underwood has one of the best producing herds in Wisconsin and it is an asset to own a bull coming from this good herd. The cows have made creditable A. R. records and if wanting a bull that has the proper backing, let Mr. Underwood quote prices and description. Kindly mention The Wisconsin Farmer when writing for information. See page 21.—Adv.

Hurry if You Want One of Fred Gurr's Polkadot Calves.

FRED GURR, Lake Mills, Wis., writes that he has just sold another one of his choice sons of King Segis Pontiac Polkadot, a full brother in breeding to the Sunset Hall King Segis Pontiac Alcartra. Anyone desiring a bull bred along these lines should write to Mr. Gurr and get order in early. See advertisement on page 20.—Adv.

Birch & Thompson and Bartlett Hereford Sale.

SIXTY head of representative Hereford cattle from the herds of Birch & Thompson and A. C. Bartlett, Lake Geneva, Wis., will be offered at public sale at Chicago, Wednesday, January 9th, and the buying public will be pleased with the offering in its entirety. Birch & Thompson sell 20 of their best breeding cows, 10 with calves at foot by Bonnie Brae 43d, Beau Perfection 33d, Fred Real, while there are a number of cows and heifers bred to these bulls and also to Beau Gomez 2d, a son of the $4,000 Beau Gomez. In the female list is Cora Fairfax by the champion Perfection Fairfax, one of the good things to go through a sale ring this season. The Bonnie Brae bred Miss Princess 20th is a deep, thick, typey one, right sort in every way, and a top one in any sale. Miss Gem 11th, with a heifer calf at foot by Fred Real and rebred to Beau Gomez 2d, represents value in every way. There are a number of heifers in this offering of great promise. Birch & Thompson sell a proven sire in Beau Gomez 2d by Beau Gomez. They are also selling two senior yearling Fairfaxes, Beau Fairfax 2d by $4,000 Beau Fairfax and Emperor Fairfax by Prince Fairfax, that are worthy of consideration. Four strong yearling bulls, the get of Beau Perfection 33d, McVeigh and Homer, are also listed. On part of Mr. Bartlett the sale is practically a dispersion, as his herd manager has been drafted for war, and, as Mr. Bartlett cannot readily fill his place he is reducing his herd to the lowest possible point. There are 13 breeding cows in his offering of the right kind, and seven sell with lusty calves at foot. Practically everything of breeding age is bred to Imp. Eaton Druid or Hero's Meddler, a son of Bonnie Brae 43d. These cows and heifers have had no particular fitting, but are in good shape, and will certainly make money for the buyer. Mr. Bartlett also sells the imported bull, Eaton Druid. He was one of the best bulls brought over by the late George Leigh in his last importation, and his calves show him to be a sire of merit. The breeder looking for an entirely new strain of blood will do well to give consideration to this bull. This entire lot of Herefords will stand inspection. The sale should have liberal support. The advertisement appears on page 21. Look it up and write for copy of the catalog to Birch & Thompson, Lake Geneva, Wis. Kindly mention this paper when you write.—Adv.

Henry Wenham, Milton, Wis.

HOGMEN looking for Duroc Jersey bargains will find them in Mr. Wenham's herd. He is now offering two young sows that are half sisters to King Defender, being out of the same sow as this noted boar. They are both safely in pig to Col. Volunteer bred by Mr. Parker at Janesville, sire Royal King and dam Brown Lady. Mr. Wenham also has a number of choice gilts having plenty of stretch, good bone and splendid backs. These gilts are not bred and we are confident that farmers looking for this class of hogs will find them priced satisfactorily by Mr. Wenham, who has decided to reduce his herd on account of the shortage of his corn crop. See the advertisement on page 23.—Adv.

Ackerman, of Grant County.

W. F. ACKERMAN, Glen Haven, Wis., has one of the good Poland herds in Grant county. He is now in a position to sell bred gilts worth the money. His gilts have been well grown and we are sure they will give satisfaction—the Ackerman Polands always do. They are bred and safe in pig to a Master's Giant-Orange Wonder bred boar. We gladly refer you to Mr. Ackerman. See page 23.—Adv.

A Little More Than Pork Price.

CARL HICKCOX, Spring Green, Wis., writes that he only has eight spring Chester White boars left and in order to clean up in a hurry he will sell these at practically market price. The boars are all right and two of them are out of the top sow in the Burlington sale last winter. Write Mr. Hickcox. See page 21.—Adv.

Maurer's Good Short-horn Business.

RICHARD MAURER & SONS, Fox Lake, Wis., write that they have been having a fine demand for young Short-horn bulls. This firm has some good cattle, Scotch and Scotch-topped breedings, and will gladly quote prices and description on whatever you may wish to buy. Write them. See page 21.—Adv.

Siebecker at Baraboo.

L. R. SIEBECKER, Baraboo, Wis., has a few well-bred boars for sale. He is one of the younger breeders and does not expect to get long prices, but he will give you value received. See page 23.—Adv.

Good Durocs.

W. A. WEBER & SONS, Poynette, Wis., are offering a nice lot of Duroc Jersey spring gilts bred to a very good boar. Their price is in keeping with individuality and breed-

ing. We are glad to recommend these breeders to prospective buyers. See page 23.—Adv.

Ames Bros. to Sell, January 28th.

AMES BROS. the genial Duroc breeders of Weaver, Minn., who own, what we consider, the best son of Pathfinder in the Northwest, will hold their annual sale of bred sows on Monday, January 28th. This sale will be the first of the Wisconsin circuit of Duroc sales and we are glad to say that the offering will compare favorably with any of the week. They will sell 50 head and about 40 of this number have been bred to Pathfinder Disturber, the boar mentioned above. No good breeder of the Northwest will want to be without a spring litter by this good boar. They are also using a son of the Minnesota and Wisconsin grand champion and a son of the $2,500 boar, Giant Invincible. Don't forget the date and watch the January 10th issue of The Wisconsin Farmer for further announcement. If you are going to want a catalog of this sale, make your wants known now to Ames Bros., Weaver, Minn.—Adv.

Howell and Gerrits, Waukesha, Wis.

THE Howell & Gerrits herd has until recently been known as the D. J. Howell Holstein herd, a herd that has been conspicuous in Waukesha county for a number of years and particularly at the recent Holstein sales. It was Mr. Howell's two-year-old heifer that topped the sale last spring. His consignments have always been well fitted and have consequently brought the best prices. They are now offering at private sale a 30-pound son of Sir Beets Cornucopia Netherland and from a 31-pound dam that has a yearly record of 879.49 pounds of butter to her credit. This 31-pound bull calf was born February 24th and is a nice, straight individual. It seems to us that he is a bargain at $400. It will pay breeders interested in such a calf to call on Howell & Gerrits at once for further particulars. See advertisement on page 20.—Adv.

Hewitt Chester Offer.

MR. HEWITT, the Chester breeder living at Galesville, Wis., starts an advertisement in this issue calling attention to Chester White boars that he has for sale. He has some 14 head and they are well bred and well grown and they are priced for quick sale. The man that wants a boar of this breeding will make no mistake if he gets in touch with Mr. Hewitt at once. Most of the breeders, who have been advertising, are sold out, but Mr. Hewitt's advertisement is just starting and you get the pick from a good herd. This breeder has a good lot of sows and they are being bred to a litter mate to the grand champion boar at the Minnesota State Fair this year. Note the advertisement on this page, and when writing for details please mention The Wisconsin Farmer.—Adv.

William Bowe's Poland China Offer.

MR. BOWE states that he has an exceptionally fine lot of Polands for sale and that he will make the following offer to anyone purchasing these hogs, which to us seems very fair. Mr. Bowe is so confident that they will meet the approval of purchasers that he is willing to refund the purchase price and pay the express one way on any animal returned. Anyone looking for high-class Polands should get in touch with Mr. Bowe at once. address him at Fox Lake, Wis. See page 23.—Adv.

P. S. Johnson, Kilbourn, Wisconsin.

MR. JOHNSON states that he has a number of choice bull calves from A. R. O. dams for sale, as well as a limited number of splendid females. See advertisement on page 20.—Adv.

R. J. Thomson, Austin, Minn.

FARMERS interested in fancy poultry, especially the leading varieties, should write for Mr. Thomson's 1918 catalog.—Adv.

With the Duroc Men in Illinois.

FOR the benefit of the Durocs in Wisconsin, the writer called on several Duroc breeders in Illinois who breed and raise hogs of this color believing that Wisconsin needs a little more variety of breeding. We called on the men that had boars with national reputation or sired by same.

The man that owned Orion Chief, The Professor and many other history-making boars is Henry Matern, Lostant, Ill., a breeder that has contributed much to Duroc history. The attraction on the Matern farm is Financial King, a son of L. E.'s Valley King out of a dam by The Professor. Financial King traces five times to Ohio Chief. He is big, a wonderful back, the best of feet and bone in fact is a show boar. He was second at Springfield and Chicago and first at Peoria in 1916. This year he was first at Springfield and second at Chicago, but he was the favorite at Chicago for first and champion. Eminent Chief is another good boar on this farm. He is sired by Cherry Chief and was first at Springfield and Peoria as a senior yearling last year. Honey Boy is a senior yearling by Orion Cherry King. Matern sells Durocs on January 23d—watch for the advertisement in the January 3d and 10th issues. Wisconsin men can use this breeding.

Everett & McDowell, Streator, Ill., have one of the best Duroc herds we saw and they have the best Orion Cherry King boar, age considered, June 26, 1916, that we have seen. They call him Orion Cherry King 7th. He is high up, has a fine-arched back, and ideal head and good eye and feet that are perfect. This boar has been used on some grand sows in this herd. Proud Helen by Proud Col. and the dam of Atwater's grand champion sow, Proud Helen 2d, is owned in this herd. This sale will be advertised in The Wisconsin Farmer. The sale will be held February 7th. Here is what will be found in the sale: Sows by High Chief, American Cherry Chief, American Top Col., O. C. K. Col., Cherry Chief I Am, Col. Jack and Cherry Chief. Don't forget Orion Cherry King 7th, without a doubt one of the best of the Orion Cherry Kings.

At the home of O. C. K.'s Chief. No boar in Illinois has caused as much sensation during the last few months as O. C. K.'s Chief, the massive son of Orion Cherry King. This boar is the biggest O. C. K. boar, combined with quality that the writer has seen. Many of the boars of this breeding are high, have good backs, etc., but this boar is tall yet he has a great spring of rib, deep sides and excellent in the ham. In our estimation he is the best aged boar of this breeding that we know of. W. H. Garber, Washington, Ill., (first station out of Peoria) is the owner of this good boar. He made a boar sale in October and sold 38 at an average of $80—this was his first sale. Mr. Garber holds a bred sow sale on Saturday, January 19th, and will sell 50 head of fancy sows and gilts. Forty will be bred to O. C. K.'s Chief. This sale will be advertised in the January 10th issue of The Wisconsin Farmer. Watch for it so you can get a catalog.

At Van Meter's we had a real feast. These breeders sure have the good ones and when January 22d rolls around we feel safe in saying they will drive into the ring an offering of big sows and gilts that have never been equaled in an Illinois sale. In the first place Cherry Chief Wonder is without a doubt as good a breeding boar as old Cherry Chief ever sired. His get has won more prizes at the Illinois State Fair the last year than all other boars combined. Mollie Wonder 1st, the Illinois grand champion, will be the real attraction. Litter sisters to her also sell. Futurity winners, first-prize yearlings, in fact the aristocracy of the breed. Cherry Chief Wonder gilts have been bred to Van's Orion Cherry King, a mammoth son of Orion Cherry King. To make a long story short this is one of the greatest sale offerings of the year. We will have more to say in The Wisconsin Farmer in the issues of January 3d and 10th. If you should want to write them, the address is W. H. & A. D. Van Meter, Williamsville, Ill.—Adv.

A. W. Arnold's Short-horn Sale.

A. W. Arnold held his first public sale of registered Short-horn cattle at his farm near Galesville, Wis., December 20th, the result of which was very satisfactory to all concerned. The cattle were sold in ordinary condition, in fact many of them were too thin to bring their full value. Many good cows with large calves at foot were the real good buys and the men that were fortunate in getting such should feel duly proud of their buys. The top of the sale was Dale's Star, a roan senior yearling that was a winner at many of the fall fairs. He is sired by Dale Clarion, a son of the great sire, Double Dale. On the dam s side he comes from the Cruickshank Victoria family, one of the most popular of the Scotch families. This bull goes to head the good Richard Maurer & Sons' herd at Fox Lake, Wis., at $1,000. The next top of the sale, also a bull and a full brother to the $1,000 bull, was Dale's Victoria. He went to Hammer Bros., Cooperstown, N. D., at $780. This was a great pair of bulls and were well worth the money paid for them. The top of the females was White Beauty, a two-year-old heifer sired by White Rock, he by Whitehall Sultan, and bought by Chas. Rogers & Son, Union Center, Wis., for $450. The dam is of the noted Campbell Mina tribe. She was well along in calf to Dale's Star, the $1,000 bull. Wisconsin men were on hand to buy cattle. One of the largest crowds we have seen at a sale this year was in attendance and practically everything in the sale went to Wisconsin buyers. It was a good, clean sale in every respect and Mr. Arnold is to be congratulated on the businesslike manner in which he conducted the sale. H. O. Tellier sold the offering.

SUMMARY.

12 bulls	$ 3,740;	average....	$312
42 females	8,720;	average....	208
54 head	12,460;	average....	231

THE MARKETS.

Union Stockyards, Chicago, Ill., December 22.—Live stock feeders all over the country are confronted with a situation that in some respects is unusual and discouraging. Right at the time when everybody is trying to do his bit and when statistics showed that the corn crop was the largest on record, feeders find their corn soft and very inefficient as a fat producer. In reality the actual crop of corn that is merchantable and dry enough to crib safely is small. There is only one thing that can be done with it and that is to feed it as quickly as possible. This is being done, but results are unsatisfactory. Thousands of cattle are being forced on the market in a half-fat and unfinished condition because the corn is not producing the gain that is ordinarily expected. Receipts of cattle for the current month have been much larger than usual for this time of the year due partly to the rush of range cattle from the West which showed the impatience of ranchmen to cut their supply down to a safe winter feeding proposition. From now on practically no range cattle will be marketed, as the roundups are cut off by the cold weather. In the cornbelt section farmers and feeders are watching the market dial very closely and the impulse is to ship their stock half fat rather than feed to a finish. The year's receipts of cattle at Chicago will show an increase of about 550,000, while the gain at ten markets combined will be about 2,900,000.

Although hog values have had a slump of around $1 per cwt. from the high time the fore part of last week, the market is still abnormally high for this time of the year and the trade holds very optimistic views regarding the future. While receipts have expanded materially within the last fortnight, they are still running short of normal for this season of the year. Chicago's receipts of hogs are about 1,700,000 shy of last year and at the 11 principal hog markets of the country the deficit will show up about 4,100,000 head. This means an enormous decrease in pork products at a time when the demand is greater than ever before.

Sheep receipts have been comparatively small for the past month and there is no indication of a liberal supply in the near future. The market, however, has been seriously handicapped again this week by the shortage of cars that has made it impossible for eastern shippers to fill a large percentage of their orders for supplies at this market. This has greatly curtailed competition that, had traffic conditions been more nearly normal, would have proved a big prop under the trade for a wide shipping margin has existed all this week between Chicago and eastern markets. Many feeders who bought lambs last fall at $18@18.50 per cwt. have sent them back to market in finished condition and received $16@16.75. This has discouraged the later feeders from taking hold and few feeding lambs have been sent to the country in recent weeks. Chicago's sheep supply for the year will show a decrease compared with last year of about 750,000 head, while the decrease in receipts for the year at 10 markets will aggregate about 1,250,000.

A reduction of 21,000 cattle in receipts here the first five days this week compared with like period last week has been a price-boosting influence in the trade and the steer market at the close yesterday stood largely 25@35c higher than a week ago on most killing classes. Quality has been of low average and buyers have shown an increasing preference for good weight bullocks, the scarcity of which in the run has been more marked than at any preceding time this season. The workings of the zone-loading system have made Tuesday and Thursday the busiest days of the week instead of Monday and Wednesday as formerly. Under the new zone loading plan shipments within a radius of approximately 300 miles of Chicago are barred from Monday and Wednesday sessions of the market. At this time of the year a big percentage of the supply comes from territory within this 300-mile radius, the Monday and Wednesday runs are naturally comparatively light. An effort is being made to have the first zone changed and it is likely that it will be cut down, possibly to 200 miles. If this is accomplished it is thought receipts will be extremely well distributed during the five chief market days of the week and the benefits of the plan will be thereby materially improved. Now that demand for Christmas trade has been satisfied the extreme high prices paid early in December and previously for prime heavy bullocks are no longer quotable. The best cattle here this week sold at $14.50 and this figure is now considered the extreme limit of the market. There are very few long-fed cattle left in feeders' hands and the proportion of sales above $13 this week has been very small. The crop has consisted chiefly of plain light to good short fed cattle and the bulk of the trading has been within a range of from $9.75@12.25, while a sprinkling of common light killers has sold down around $8.50 and tail-end canner steers as low as $6@7.

Both Christmas and New Years day will be observed as holidays on this market and the trade is counciling moderate marketings on this account until after the turn of the year. The market is still handicapped by the difficulty shippers are experiencing in securing cars for shipment of stock East on foot, although the traffic situation has been somewhat better this week than last. Once the transportation question is on a more normal basis and feeders rush to liquidate warmed-up cattle subsides the market is expected to hit and maintain a better stride, although for the next 30 days or so the movement of short-fed cattle is likely to continue of good volume.

Butcher cattle have formed a moderate proportion of the week's receipts and fat cows and heifers are generally 15@25 cents higher than a week ago, while canners and cutters have advanced 25@40 cents and bologna bulls are a good half dollar higher, the demand for the latter reasserting itself on improved transportation facilities which permit eastern buyers to take hold more freely. Most of the butcher cows are selling from $6.75@8.50, while a few prime heavy kosher cows are landing up to $11@11.25 and there is increasing call for such. Desirable canner cows are on a $5.75@6 basis and cutters of good strong class sell on up to $6.50. Good to choice heavy bologna bulls are making $8.25@8.65, with fat beef bulls of good class upward from $9 and common light cannery grades at $7@7.50. Veal calf trade continues to show phenomenal strength for this time of the year, the market at the close yesterday being mostly 25 cents higher than a week ago, with good to choice vealers selling at $16@16.25 and prime up to $16.50, equalling the yard record established last September.

The stock and feeding cattle market has been benefited by more moderate receipts and improvement in the car situation. Trade shows 15@25-cent advances over the close last week, but is still quite a little lower than the recent high time and bids fair to work to higher levels. Most of the trading this week has been within a range of from $7.75@9.50 and occasional loads of choice, selected meaty feeders are going out at a cost on up to $10.75@11. Demand, however, has been broader for the lighter, younger cattle this week, many buyers, figuring on generous receipts of short-fed cattle during the next sixty days, showing a preference for something to be roughed through the winter and thrown on grass next spring.

MISS PRINCESS 20TH.

Offering of High-Class HEREFORD -CATTLE-

50 FEMALES AND 10 BULLS

Chicago, Illinois

Wednesday, Jan. 9

From the herds of Birch & Thompson and A. C. Bartlett

IMP. EATON DRUID.

50 COWS AND HEIFERS SELL—20 of these come from the herd of Birch & Thompson, 10 of them with calves at foot by Beau Perfection 33d and the show bull, Bonnie Brae 43d, and 10 fine young heifers by the same sires, both bred and open. Included in this list is Miss Princess by Bonnie Brae, well along in calf; Cora Fairfax by Perfection Fairfax, a good one; Miss Gem 11th, with heifer calf by Fred Real and rebred to Beau Gomez 2d. A. C. Bartlett sells a lot of good breeding cows sired by Defender, Dale's Eclipse and Star Wilton, 7 of them with calves at foot. He also offers a string of nice young heifers, several of which are bred to Hero's Meddler, a good son of Bonnie Brae 43d.

10 GOOD BULLS ARE LISTED—There are two proven herd sires in the lot, Beau Gomez 2d by the $4,000 Beau Gomez, and Imp. Eaton Druid, one of the best bulls brought over in the Leigh & George importation. There are also two 12-month-old sons of Beau Gomez 2d that are strong prospects, and two Fairfaxes, Beau Fairfax 2d by the $4,000 Beau Fairfax, and Emperor Fairfax by Prince Fairfax. Four extra good yearlings, two by Beau Perfection 43d, one by McVeigh and one by Hero, complete the bull list. This is an offering of low-down, thick-fleshed breeding cattle that should meet with approval sale day. You will not be disappointed in the offering. Send for the catalog. Mention this paper and address

JOHNSON BROTHERS'

MINNESOTA'S PREMIER DUROC BREEDERS

ANNUAL

BRED SOW SALE

THE GREATEST LOT OF BIG SOWS EVER SOLD IN THE WEST. EVERY ONE A MATURED SOW OR FALL YEARLING.

TUESDAY, JANUARY 8, WINNEBAGO, MINN.

TWO by Fancy's Victor, 6 choice daughters of King the Col., 6 grand fall sows by Pathfinder, 2 by King's Col., 1 great sow by Chief of Col., 1 outstanding sow by Golden Model 9th, others by the champion, Royal King, Col. Pilot Wonder, Gano Model Educator, Educator, The Admiral. All bred for March farrow. You can't duplicate this offering of sows.

Bred to ORION CHERRY, a giant yearling by Orion Cherry King, and full brother to King Orion Cherry. ROYAL KING 2D by the champion Royal King, and the best boar he ever sired.

Sows in herd of Johnson Bros., Winnebago, Minn. Some of these go in our sale January 8, 1917.

Bred to ORION COMBINATION by John's Combination.

Bear in mind that we have never purchased a poor individual; we topped sales when we bought our foundation. The tried sows are right in every way. The fall and spring yearlings are now carrying their first litters, consequently they are big, the high-backed, good-footed kind. You should attend if you like the big kind with quality and breeding. We have the sows that please the critical. The catalog contains history-making pedigrees---did you get yours? We have one for you. Write. If you can't attend send bids to T. P. Shreve, field man for Wisconsin Farmer; we guarantee his purchases. N. G. Kraschel, auctioneer. **Don't forget the date.**

JOHNSON BROTHERS WINNEBAGO, MINN.

BOARS

HAVE A FEW CHOICE DUROC BOARS, as good as can be found in the state. On Nov. 12th the lightest one weighed 237 lbs. and the heaviest 287 lbs. They are of my very best and popular breeding. They must be sold at once. Write
W. C. JENKINS Bangor, Wis.

DUROC BARGAINS—We are offering two half sisters to the great King Defender. These young sows are safely in pig to Col. Volunteer, a son of Royal King. Also am offering a number of richly-bred gilts that have lots of quality, good bone and fine backs, with plenty of size. We must reduce. Priced to sell. Henry Wenham, Milton, Wis.

BURT FARM DUROCS

A FEW BOARS left at attractive prices. Spring gilts weighing from 230 to 280 lbs., bred to a Golden Model boar. We ship on approval and guarantee satisfaction.
F. H. BURT Brodhead, Wis.

JANESVILLE DUROCS

OFFER 20 well-grown spring boars, that will give satisfaction. All registered. Farm adjoins town. Write or visit us.
JOHN WALDMAN & SON Janesville, Wis.

Orion Cherry Col.

SIRE, Walt's Top Col.; dam, by Orion Cherry King. Duroc fall pigs by above boar for sale. Write
RUNDE BROS. Cuba City, Mo.

DUROC BOARS

SIRED BY Col. Volunteer, out of sows sired by a son of Critic B., grand champion at Nebraska Fair. Bred and priced right.
CLARENCE WENHAM Ft. Atkinson, Wis.

Good Durocs Take Less Feed

I'LL SELL YOU BOARS OR GILTS at farmer prices. The pigs are in fine condition. Write for prices to
L. R. SIEBECKER Baraboo, Wis.

FT. ATKINSON, WIS.

DUROC gilts or boars for sale at reasonable prices. Let me quote prices.
W. W. GOODRICH Ft. Atkinson, Wis.

When writing to advertisers kindly mention The Wisconsin Farmer.

Super-Durocs

WILL DEFY ANY BREEDER in the state to show 20 better spring gilts than I have. They have been bred to a son of DREADNAUGHT and a son of KING ORION and will be sold at FENNIMORE, JAN. 25TH. SEND NAME FOR CATALOG.
WM. C. EDGE FENNIMORE, WIS. (Grant County)

More Champion Blood

THAN ANY HERD of Durocs in N. W. If you want Durocs that are bred in the purple just drop me a line. Will not hold a sale so gilts are offered at private sale.
JOHN SWENSON Willmar, Minn.

DUROC GILTS

HAVE A FEW CHOICE, BIG GILTS bred to KING ORION JR. I'll ship on approval. Order now.
CLARENCE GEORGE Evansville, Wis.

"DU ROCKS"

OUR GILTS are now bred and safe and they are for sale. We will gladly quote prices and description if you'll write.
W. A. WEBB & SONS Poynette, Wis.

HOMESTEAD DUROCS

—IF YOU WANT BRED GILTS OR SOWS,— write us.
M. H. O'KEEFE & SON Waunakee, Wis.

BRED GILTS

DUROC GILTS bred to ORION KING, the best son of the G-C King Orion. If interested, get my prices first.
MIKE STOEHR Viroqua, Wis.

After January 1st

WE WILL OFFER bred Duroc sows and gilts. The big kind bred to big boars. Keep this in mind.
GEO. D. SPRAIN & SON West Salem, Wis.

DUROCS ON APPROVAL

BOARS weighing from 200 to 250 pounds, extra good. You see your boar before you pay. Satisfaction or no sale. Could make you no better proposition. Order one. Gilts all sold.
FRED G. MATTHES Viola, Wis.

CHIEF DEFENDER

THE LARGEST YEARLING DUROC BOAR in the state. My best gilts are bred to him. Do you want a big-type gilt, bred to this big-type boar?
R. O. CHURCH Elkhorn, Wis.

ROYAL KING 4TH'S TRIO FOR SALE

WE ARE OFFERING two young Duroc boars and a gilt by the above sire and from a daughter of Prince Defender. These pigs are the best in the litter. Write for prices.
R. B. HERRLING Glenbeulah, Wis.

HORSES.

PERCHERONS, BELGIANS, SHIRES—One of the largest breeding herds in the world. I can spare 75 young reg. mares in foal. 2, 3, 4 and 5-yr. stallions, ton and heavier; also yearlings.
FRED CHANDLER, R. 7, Chariton, Ia.

POLAND CHINA SWINE.

O. C. OLSON, STRUM, WIS.

IF YOU WANT TO BUY ANYTHING in big-type POLAND CHINAS write me. Have a large herd and can supply you with boars or gilts or matured sows. The pigs are sired by BIG TYPE JIM, a son of Jim Crow, and many of them are out of MAC'S CHIEF dams, the boar that was twice grand champion at Milwaukee.

SPECIAL PRICES ON FALL PIGS

I HAVE FOR SALE 40 pigs of August and September farrow, sired by Big Bone Wonder, the boar everybody is talking about; Smooth Price, a 1,000-lb. boar, and by Knoxall by the great Big Knox. There are some great herd boar and brood sow prospects among them. Am breeding 30 spring gilts, mostly by Big Bone Wonder, for March, April and May farrow. Also have some bulls of Glenwood breeding, half-brothers to the junior and grand champion bull at the Indiana State Fair, for sale.
L. P. MARTINY Chippewa Falls, Wis.

Big-Type POLANDS

I RAISED 27 BOARS by eight different herd sires, and have a few choice ones left. Several by CHIEF PRICE 256331, who sired the first prize boar pig at Minnesota and the largest pig at Omaha. Some by Mc'S BIG BONE 257809, and such noted boars as ORANGE WONDER, BIG BEN JR., BLUE VALLEY KING, JUMBO WONDER and SUNRISE PRICE, out of sows that were sale toppers and state fair winners. Act quick if you want a boar. No gilts for sale until after January 1st. They will be in pig to my $500 OAKWOOD BIG MODEL, first prize senior yearling at Minnesota, Wisconsin and LaCrosse. Weighed 870 pounds in August. Correspondence invited.
W. W. QUACKENBUSH (Jackson Co.) Melrose, Wis.

Poland Boars for Farmers

HAVE A FEW smooth, good-footed spring boars for sale. They are big and of choicest breeding. GUARANTEED in every way. Also have a nice assortment of fall pigs—boars and gilts—and will price trios so as to interest you. I HAVE POLANDS TO SELL AND THEY ARE PRICED ACCORDINGLY. Try me.
H. H. SMITH BARABOO, WISCONSIN

The Sale of Sales

FEBRUARY 6TH—I will offer the greatest lot of BIG-TYPE POLAND SOWS ever cataloged for a sale in Wisconsin. The offering will consist of prizewinners and grand champions, bred to Mc's Big Bone, Postmaster, Jumbo's Giant, a son of Orange Boy, and a son of Gerstdale Jones. PLAN NOW TO ATTEND THIS SALE. Let me send you my illustrated catalog. Send me your name.
J. D. McDONALD :: :: :: :: West Salem, Wis.

P. N. COLLINS RIVER FALLS WISCONSIN

MY EARLY POLAND boars and gilts are all sold. Have a nice lot of August pigs, that will go cheap, by CHIEF PRICE and SMOOTH JUMBO. Yearling rams sold, some good Oxford lambs. A nice Short-horn bull calf from a heavy-milking dam. Write and tell me what you want—we can do business.

30 YEARS BREEDING POLANDS

THIS FACT ALONE should prove that I have bred and sold POLANDS that have given satisfaction. Have choice BOARS and GILTS to ship this year at prices that you cannot turn down. Send your order at once.
R. MEINKING Bangor, Wis.

Ackerman Poland Chinas

I CAN SELL YOU a spring boar or bred gilts at a price that you can't overlook. They are big, they are well bred, they have quality and they are guaranteed in EVERY way. I HAVE THE GOODS. Write
WM. F. ACKERMAN Glen Haven, Wis. "Grant County."

CHANCE

Model Major 2d For Sale

NO BETTER 3-year-old Poland boar in Wisconsin. Second at Milwaukee, but had friends for first place. Can show you good pigs by him. Price reasonable. Guaranteed.
ED W. HENDRICKS Hazel Green, Wis.

POLAND GILTS

BRED to a son of the $6,600 Gerstdale Jones for sale. Every gilt a big one. Also fall pigs, either sex, priced cheap.
A. W. COLE LODI, WIS.

REMEMBER

I AM FOUNDING one of the best Poland China herds in Wisconsin. Bear this in mind for future reference.
JOHN F. O'BRIEN R. 5, Madison, Wis.

Jas. Derivan, Fox Lake, Wis.

OFFERING big Poland gilts bred to TIMM EQUAL by TIMM WONDER by Fessy's Timm. These are the blood lines that count. The price is right.

POLAND CHINA BRED GILTS

TO FARROW in March and April, to Blue Valley Big Boar Jr. Also a few boars left that I will close out at a reasonable price to make room for my fall pigs.
JULIUS H. PETERSON Kilbourn, Wis.

REGISTERED POLAND CHINAS

WE HAVE a number of spring boars ready for service, also open gilts. Bred gilts January 1st. Satisfaction guaranteed. (Registered Holstein.)
Marinette Co. Insane Asylum Peshtigo, Wis.

When writing to advertisers kindly mention The Wisconsin Farmer.

POLAND CHAMPIONSHIP MATERIAL

BUY FALL PIGS, they come cheaper and you can grow them at a profit. I have 75, every one out of a mature dam and sired by my winners, the grand champion McChief, OAKWOOD BIG MODEL, 870-lb. yearling, first at Minn. and Wis.; OAKWOOD GIANT, first junior yearling at Wis., and Mc'S BIG BONE, the grand boar we expect to show in the aged class next fall. Priced to sell, single, pairs or trios. Write
J. D. McDONALD West Salem, Wis.

LOOK AT THIS

MALTBY'S BLACK JUMBO, by Mouw's Black Jumbo. Dam by Mouw's Chief. A better, big-type pedigree could not be written. Gilts by SMOOTH KING by Goldengate King, have been bred to first mentioned Poland boar. THEY ARE FOR SALE—FIRST WRITE, FIRST SERVED.
C. S. MALTBY Janesville, Wis. "Polands."

POLANDS

MARCH AND APRIL PIGS—The best we ever raised. They have the size and bone. Sired by six great big-type boars. See us for herd headers. Also dual-purpose Short-horn bulls.
M. MADSON & SONS R. 4, Madison, Wis.

Poland Chinas

SHIPPED and if not satisfactory return them and I will pay the express one way. Write your wants to

THOROUGHLY VERSED on pedigrees of leading breeds of live stock.

This Pony FREE

Pollyanna

Pollyanna is a beautiful 3-year-old black Shetland Pony, about 42 inches tall. She weighs about 300 pounds and is worth pretty nearly her weight in gold. Of the 500 Ponies we have given away to Boys and Girls, we think Pollyanna is one of the prettiest.

You may have seen lots of Ponies in Circus Parades, but we don't believe you ever saw one prettier than Pollyanna, and we are going to give her to you, or to some other Boy or Girl, who sends in his or her name.

Hitched up to her cute, little Pony Buggy, Pollyanna will pull you and all your boy and girl friends that can pile in. Then, when you are tired of driving, you can throw on the Saddle and Bridle we give with Pollyanna, and go scampering around the country.

Can you think of anything you would rather have than Pollyanna?

Read this page carefully and then send in your name and address at once.

We shall give YOU, or some other Boy or Girl, this Shetland Pony, with complete Buggy, Harness, etc., just as it looks in this picture.

If You Want to Own Pollyanna

or Any One of the Other Ponies we are giving away

The Outfit

Best of all, we send free with Pollyanna the complete Pony Outfit just as you see it in the picture.

Besides the Pony, the Pony Buggy, and the Harness, we also send a Saddle and Bridle, which will make you the most complete outfit money can buy.

The Pony Buggy is the most comfortable riding and easiest pulling we could buy. We have given away so many that we know what kind most boys and girls like.

The handsome nickel-trimmed harness looks just fine on Pollyanna, and the Saddle and Bridle are made to order for her.

No child, no matter how rich his parents may be, owns a nicer Pony and Outfit than this one, and we shall send it free with all charges paid to some Boy or Girl.

This is surely the best chance you ever had to get a Shetland Pony, and if you think you would like to have it, send your name and address right away. Some Boy or Girl is sure to get it.

Send Your Name TODAY

As soon as we hear from you we shall write you all about Pollyanna and the several other Ponies we are giving away, and tell you how to win one of them. Don't let anyone tell you that you cannot win a Pony, because our plan of giving Ponies is different from all others.

We make it easy for children to get Ponies. We use them to advertise our big magazine, the Farmer's Wife. We have already given Ponies to more than 500 Boys and Girls, all over the country. Some of these children who received free Ponies were only 6 or 7 years old, so you know we must have made it easy for them to win. Just send your name and address and see.

(101)

We Have Given Away Over 500 Ponies

Here are the Names of 45 of the Ponies We Have Given Away and the Children Who Won Them:
